FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, THIRD MONTH 19, 1859.

No. 1.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

AN EPISTLE TO FRIENDS FROM JOHN SIMPSON.

Dear Friends,—My mind has been solicitous that we may improve, believing religion is progressive, and will progress, if we are faithful. Let us, therefore, press forward toward the mark of the prize of the high calling, whereunto we are called, and not sit down in a careless, lukewarm situation; for Zion will travail, and oh! that she may bring forth children to the honor of our Heavenly Father. And that there may be fathers and mothers that may take these little ones by the hand that are travelling for the prosperity of Zion, and for the honor of their God. Then we shall have judges as at the first, counselors as at the beginning, and Zion will shake herself from the dust of the earth, and put on her beautiful garments of righteousness and peace; and those interesting prophecies spoken in the Prophets be fulfilled, when the mountain of the Lord shall be established in the top of the mountains and exalted above the hills, and they shall say, come let us go up to the mount of the Lord, to the house of the God of Jacob, and he will teach us of his way. And now, dear friends, let us walk in his path—the path that he has cast up for his redeemed and ransomed to walk in; then the law will go forth of Zion, and the word of the Lord from Jerusalem, religion will be our law, and peace and righteousness our conversation. Then there will be nothing to hurt or destroy in all his holy mountain, the Church. Ephraim will not vex Judah, nor Judah envy Ephraim; no bickering about religion, but each worship under his own vine and fig tree.

Now, my dear friends, let us guard against a spirit of boasting, and leaning to our own understanding, remembering from whence all good comes and all right direction, rendering the

praise where due; for the Lord will not give his glory to another, nor his praise to graven images. Let us look to the rock from whence we were hewn, and hole of the pit from whence we were digged, and not think it was done by our own wisdom, for the Lord alone was to be exalted in that day—in those Christian days—and in all our movements take him for our guide; for the Lord's children are taught of him. Now if we take him for our teacher great will be our peace.

In the transaction of our discipline, let it be done in the peaceable spirit and wisdom of Jesus, and not one endeavoring to bear down another by force of argument, or multiplying of words, but showing a decent condescension one to another. The rulers of the Gentiles exercised lordship over one another, but it was not to be so in the Church of Christ, but all to be as brethren.

Believing there, are many looking toward Friends, as we may see it in our large Quarterly Meetings, &c., and they come with a good intent, not being able to get what their poor souls desire from the barren mountains of their empty profession, nor those hireling teachers that teach for hire, and divine for money; that are wells without water, and clouds without rain. Now those seeking ones are looking towards Friends, and if we keep to our profession, they, seeing our good works, will glorify the Heavenly Father, and flock to us like doves to the windows. But if we go back and let fall our profession, others will be raised up. God will have a people that will worship him in the beauty of holiness. And if the children of the kingdom will not come to the marriage supper of the Lamb, they will be cast out, for he will have his table filled—now there is room for all, and bread enough and to spare—all may come that will come, and partake of the waters of life freely without money and without price: and may we not say with the Prophet, "Wherefore do ye spend money for that which is not bread, and your labor for that which satisfieth not." Now I have to believe there are many up and down who find no rest for the soles of their feet, and are looking for something they cannot get from their teachers, who only direct them to the good old book—and one of the best of books; and I wish we were more conversant with it. Christ said to the Jews, "Ye search the scriptures, and in them ye think ye have eternal life:" he said they testified of him. Now how wonderfully do they testify of that inward

principle of light and grace in the heart, that Moses recommended to in his day—a teacher in thy heart—that we need not go to this man, nor the other to teach us, for the Lord hath promised to teach his people himself. Not that any one should think I have not unity with the true ministry, for I surely believe there is, and will be, prophets raised up in our Israel to preach the everlasting gospel. John saw the angel fly through the midst of heaven, having the everlasting gospel to preach to the inhabitants of the earth—and if we are faithful, there will be them raised up that will have to smite the earth with the rod of their mouth, and slay the wicked with the breath of their lips—that earthly disposition that is among us, that does seem to grasp after everything within its reach, to accumulate wealth—and to slay that wicked, vaunting spirit that would almost say there is no God.

Now let me address the fathers in the Church, that you may stand in the station wherein God has placed you, and be as pillars that shall go no more out: for the fathers, where are they? and the prophets, do they live for ever? And you of the middle age to improve your talents to the honor of God, and not bury them in the earth, nor wrap them in a napkin—not to be earthly-minded, grasping after everything within your reach to accumulate wealth; even sometimes I fear to the grinding the face of the poor. Not but it is right to be decently industrious and use prudent economy. And you that are wealthy, what a blessing it would be, if, out of your abundance, you could spare some honest and industrious young men a few hundred dollars without interest; how it might enable them to procure themselves a comfortable home in their old age.

And let me address the dear youth, the beauty of the present, and the hope of the succeeding age. Now, my dear children, let me entreat you to serve the Lord in your youth—"a flower that's offered in the bud is no vain sacrifice"—and you will never have to repent your having closed in with divine mercy in the days of your youth, but far otherwise. Let me tell you, one of the greatest regrets now in my old age is, that I did not close in with the offers of divine love and mercy before age and infirmity overtook me: but blessed be his holy name, for his mercy endureth for ever. Therefore let me entreat you not to stand out until those days overtake you, wherein you have to say, you have no pleasure in them. Now when you go to meeting (which I hope you may not neglect) consider what you go for, and what is the use and intent of our meetings, and not go in a trifling and thoughtless manner; but go in and sit down and turn your minds inward, and pray to him who seeth in secret, and he will reward you openly. We profess to be Christians, we cannot profess higher. Christ told the woman of Samaria, they that worship must worship in spirit and in truth, for the Father seeketh

such to worship him. Now when you go to meeting, go as the dignity of our profession calls for, and not in a light, trifling manner—nor stand about out of the house in light, trifling conversation: but retire in and sit down, and there beg of your Heavenly Father to teach you a prayer he will hear, and grant you worship he will own; and with gratitude acknowledge the favors received. Be not ungrateful receivers, for it is said ingratitude is one of the blackest of crimes.

We see that with all our wisdom and ingenuity we cannot cause the clouds to rain upon us, nor make one stalk of grain or grass to grow—but these are all gifts of his Almighty power. And now I conclude, and remain your friend, J. S.

Solebury, 10th mo. 1st., 1835.

TANNER'S LECTURES.

(Continued from page 824.)

It was my intention to have omitted the word "early" in the title of this concluding Lecture on the history of Friends in Bristol and Somersetshire, and to have occupied this evening chiefly with a notice of what may be called the *middle age* of our religious Society; but having been obliged, by want of space, to leave out of the last Lecture several matters of interest connected with the earlier period, I must endeavor to supply these, before passing to the consideration of later events and circumstances. No one can be more sensible than I am that the words "imperfect sketch," which were used in reference to the account given of the persecutions of Friends, is quite as applicable to the representations which I have attempted to make of their first gathering as a religious Society, of the circumstances in which the members were placed, and of the attempts which were made to supply that need of *Christian discipline* which has been felt by the Churches of Christ in every age.

Having already entered into some particulars in relation to the care of the poor and the performance of other charitable duties, I must now make a further reference to the mode of *dealing with delinquents* in the early days of our Society. That mode, was, I believe, thoroughly Christian, as respects both the *order* of the proceedings, and the *spirit* in which they were conducted. The chief object kept in view was to *reclaim*, not to cut off. When private labor failed, the case was reported to the Meeting for Discipline, the offender was invited to attend, and, if needful, a Committee was appointed to labor with him. The terms made use of in such appointments were sometimes very expressive. Two or more Friends were desired to go and visit such an one "in love to his soul, and admonish him to repent and turn to his first love, and testify against his evil;" or "in the fear" or "love of God;" or "in love and tenderness;" or "to discourse with him lovingly, and give account how they find

him;" or "to speak with him in abundance of love, and endeavor to make him sensible of his outgoing." If such a visit was declined, another attempt was ordered to be made; and sometimes, when one Committee had failed in its object, another was appointed.

The patience and forbearance exercised in some of these cases are very remarkable. In the instance of a Friend of Minehead, who was disowned by the Quarterly Meeting of Somerset for receiving impropriate tithes, to which he had become entitled in his wife's right, years of labor were bestowed before the decision was come to. In 1701 he is reported as saying, "he could justify himself, and would, one way or other, seek to give Friends some satisfaction." The Committee are then desired to ask him "in what manner he will do it?" In 1703 they were to "let him know that Friends cannot always bear with him." Again, being requested to return a positive answer, he replied that he would write to the meeting; but no letter being received, he was told that "Friends would no longer be put off." The Committee at length reported that they "did not find him like to answer," and he was thereupon disowned.

Those who on being visited expressed regret for their misconduct were asked to draw up a declaration or testimony of their repentance; and if this was considered satisfactory, they were desired to read it at the close of a Meeting for Worship, as an evidence of their sincerity. In other cases, in which the meeting had to draw up a testimony, this document was also read at the close of a Meeting for Worship.* In cases of disownment for marriage out of the Society, a copy was sometimes ordered to be sent to the priest by whom the parties had been married, and a Friend who had acknowledged himself guilty of intemperance was desired to furnish a list of all places and houses in which his conduct had been a cause of reproach, in order that a copy of his declaration of repentance might be sent to each of them. Among the declarations of repentance, copied in a book kept by the Bristol Meeting for that purpose, is one from Hannah Salter, (late Stringer,) in reference to the part she had taken as one of the followers of James Naylor. It is not clear in all cases whether the testimony issued on account of misconduct amounted to, a deprivation of membership. I have met with one instance in which a second testimony was issued, because the first was not clear on this point; and another in which it was repeated, because the individual had continued to attend meeting—his conduct being still bad. The testimonies of disunion generally concluded then, as now, with some expression of good desire for the offender, such as that he might "come to a true and living sense of his condition," &c.

* This practice was continued till 1801.

One feature common to many of these documents cannot, however, be referred to with the like satisfaction; they contain expressions which could only be considered correct, on the supposition that the Society of Friends was occupying exclusively the position of the one true Church. The perception was not wanting to the early Friends, that true believers were they, who, in the words of George Fox, "were born of God, and were passed from death to life," under whatever name they might be known among men; but believing as they did, that the Reformation had failed of its full accomplishment as respects the surrounding sects; and recognising too, in many of these, that spirit of persecution which is so inconsistent with the Christian character, they were perhaps too often led to entertain the idea, that all the sincere-hearted of other denominations would be brought to join their own standard of profession; and to speak of themselves in terms appertaining to the whole Israel of God; this remark applies also to some of the printed books of that period. In one of the controversies in which Friends of Bristol were involved, and of which an account is given in a pamphlet published in 1655, the question is put to George Bishop, by an opponent, "What do you mean by this phrase, 'My people?' Do you by that intend only those of your own opinion and party? If so, why are you only to be esteemed the people of the Lord?" George Bishop's answer was clear and full. "I answer, by 'My people,' or 'the people of the Lord,' we do understand all such in every nation, kindred, and people, who fear the Lord; be they known or distinguished by whatsoever name or appellation. They who fear God and work righteousness are accepted of Him; as Peter said in the case of Cornelius, who was converted to the faith, who was before a Gentile, and without the law; and so the Jews had no conversation with such till after Jesus was offered up, who broke down the middle wall of partition that was between, having aboished in His flesh the enmity, even the law of commandments contained in ordinances, for to make in Himself one new man, so making peace. So that when we say 'My people,' or 'the people of the Lord,' we restrain it not to any sort, or particular company, or society of men, but to such as fear the Lord as aforesaid." It is evident that the opposition which Friends at first experienced from the surrounding sects, was but little calculated to lead them to judge favorably of those bodies; but as persecution declined, it is refreshing to observe a better feeling springing up. We find John Whiting, for example, holding friendly intercourse with the Bishop of Bath and Wells; the Bishop listening respectfully to his statements and opinions, and inviting him to dine with him whenever he came to Wells.

The most frequent causes of disownment in our early days, appear to have been the being

married by a priest to a person not attending our meetings, and intemperance in drinking. The practice of the Society in regard to the first, was not uniform; in 1739 the Middle Division adopted the following minute: "Inasmuch as we are now in the practice of disowning persons that have been in unity with us, for going to the priest to be married, and upon inquiry we find that others are not in the same practice, it is agreed to apply to the Quarterly Meeting about the same." What answer was given does not appear, but in 1755, John Clark, the ancestor of the present Clark family of Street, &c., was retained in membership on his expressing regret, in a letter to the Monthly Meeting, for the *manner* in which he had been married, his wife being also looked upon as a member from the time of marriage, and attending the meetings of Friends with him. In that instance the chief objections to such marriages were obviated; John Clark not having withdrawn from his religious profession, or been involved in those differences of religious sentiment which are so important to be avoided by those who enter on the close relationship of marriage.

Great as are at present the evils of intemperance, there is reason to believe they were still greater in the times of which I am speaking. The testimony afforded by national statistics is necessarily imperfect, but it is a significant fact, that the quantity of malt annually used in England at the close of the seventeenth century, for the manufacture of beer, was from twenty-two to twenty-three million bushels, whilst in the excise year ending in 1856, the quantity was under thirty-two million bushels. The increase in the population in the intervening period, was probably not less than as three to one, whilst that of malt used in making beer was less than one and a half to one. We must not however overlook the extent to which ardent spirits have been substituted for beer. I cannot say how far the reduction of which I speak is due to the introduction of un-intoxicating drinks, such as tea and coffee, or how much of it is due to the labors of temperance societies. I am one of those who believe that total abstinence from the use of all intoxicating drinks, as beverages, is the course which should be pursued by those who wish to see the evils of intemperance still further diminished. It appears to me that the Society of Friends has derived great benefit from the extent to which its members have adopted it, and that its further adoption would be helpful alike to ourselves and the cause of temperance. But I also think that this question comes within the range of that Christian liberty, with which no Church authority ought to interfere.

I must not omit the following minute of the Bristol Men's Meeting, under date of the twenty-sixth of the second month, 1675. "The persons who were appointed to speak with Peter

Hawkins, have given an account of their care over him. And Friends do further request the same persons, or any two of them, to advise Peter Hawkins not to sell ale any longer than to dispose of what he hath, for that they do judge that Peter Hawkins *his* selling ale is contrary to the truth." It is needful to lay the emphasis on the word "his" in this minute, for I find from a more private record of the case, that the charge brought against him, and on which indeed he was afterwards disowned, was that of keeping a disorderly house. Two other such charges are made about the same time, against attenders of meetings,—one in Bristol, and the other in the West Division. There is a curious minute of Frenchay Monthly Meeting, in 1702, which states that report was made that some Friends had been visited for selling ale, and had promised when they had sold all the ale in the house, and what more the malt would make that they had by them, they would give over selling ale, except at fairs. This exception as to fairs seems rather lax, but it probably refers to the liberty granted to the inhabitants of certain towns, to open their houses as places of entertainment at fair times.

In reference to the general proceedings of the first Meetings for Discipline, two things strike me as worthy of imitation; the love and forbearance shown toward delinquents, and the uncompromising adherence to all that was felt to be right and true. We may think them mistaken in some of their conclusions, as in the matter of disownment for receiving and paying *impropriate tithes*, and for the marriage of second cousins (I forbear to speak of some other like questions, which are under consideration;) and their decrees were not intended to be like those of the Medes and Persians; but we have much to learn from them, if I mistake not, as respects their fearless adherence to what they believed to be right. *Expediency* was a word almost unknown to them. The question of whether a certain course would be politic or impolitic, was foreclosed by the consideration whether it would be *right or wrong*.

(To be continued.)

[From The Christian Observer.]

BARCLAY'S SUBTERRANEAN JERUSALEM.

Steamers, well-furnished hotels, and now a Murray's "Hand Book for Syria," are yearly crowding Jerusalem with English and American travellers, whereof some go there apparently for no other reason than because fashion has lately placed the ancient city within the limits of the "Grand Tour." Very few days are enough to satisfy their languid curiosity; and with no questions, historical or prophetic, statistical or topographical, are they disquieted while they remain. Among them, however, there is also an increasing number of those who are going, in

true pilgrim spirit and intention, to Zion, that they may "mark well her bulwarks," and "consider her palaces,"—with whom this is far from being the case. In the measure of the knowledge which they take with them, and of their diligence while they are there, they indeed find much of what they went for. They see words translated into facts; substantial realities take the place in their memory of narrative and of description; and Divine admonitions have been spoken to them afresh, with an emphasis that has fallen with strange and even awful power on their hearts. They think, and they will think always, of their visit to Jerusalem as one of the greatest blessings of their lives. And yet they must acknowledge that even this is not an exception to the law of privilege, and that it has come to them with many attendant drawbacks and disparagements.

What we here mean by the nether or subterranean Jerusalem, is that region of the ancient capital which, however familiar to them, always lay hidden from the busy and agitated crowds who lived, and moved, and had their eventful being in it during the remote eras of the Jewish history. The spaces we are speaking of lie under the thick deposit, which the great inundations of violence that have swept over the city from time to time, have left upon its surface. How deep these architectural sediments or strata are, and what ponderous heaps, especially on the slopes of the city hills and at their feet, must be cleared away before we can look on the virgin site, in outline and proportions as it was seen by Abraham, for example, as he passed it, "journeying towards the south,"—may be imagined, when one remembers that at least seven cities have succeeded one another, and been overthrown, upon that surface. Nor are we, as will be hereafter shown, without the means of estimating the amount of this superincumbency, and the rate of its accumulation. They are the excavated spaces and structures underneath it of which we are now speaking, which have not only been comparatively untouched during the greater part of the surface upturnings, but have, in fact, been protected and conserved by means of them. How this has happened will be evident if, assuming the existence of such nether region, from the time of Solomon onward, we bear in mind that each successive demolition of the civic structures, of the temple and palaces, of the porticoes and colonnades, would, either by filling up under these spaces, or by covering them, render their ruin impossible; the heaps of masonry, broken and overturned, would guard them from the ploughshare of destruction; and then, after the fragments left in each former havoc were raised and used afresh, these substructures would continue in the main unchanged, and would so continue, while the ground above was gradually thickening by the successive lay-

ers that were deposited by the ravages which, through one generation after another, were going forward on the surface.

It was in 1818 that, for the first time in modern days, the attention of residents and visitors was distinctly called to this interesting subject. In that year Dr. Richardson (and about twelve years afterwards, Catherwood) obtained knowledge of this hidden region which strongly excited the curiosity of every one who heard of it. Others, especially Walcott and Tipping, made additional discoveries of considerable importance; but all that was previously known or surmised of this interesting region, is now described, for the first time, clearly and authentically, by Dr. Barclay; and so much of new discovery in addition has been effected and detailed by him, that undoubtedly he holds the chief place amongst the unfolders of the ancient city. He has brought out the whole of this mysterious region, so far as it is at present known, distinctly into one view; and he has so done this, with such graphic clearness and such unquestionable accuracy, that, henceforth, every intelligent visitor to "the City of the Great King" will have two distinct objects before him in his pilgrimage—the city itself, standing on the deposits of its seven predecessors, with the valleys and plains and the everlasting hills that are—unchanged—around it; and underneath, distinct and quite apart from all these objects, another region, secure, and providentially guarded from all polluting, humiliating contact, where one is in immediate communion with the expressed mind and character of the ancient people,—where, in language with which no one can have tampered, we can read their thoughts and purposes, their own estimate of their mission in the world, and their views of their great heritage in future time.

We have repeatedly used the designation "nether Jerusalem," to describe this region, since it is that which Dr. Barclay employs for the heading of that part of his work which contains his information respecting it. He begins by giving an account of two long passages, which appear to have led from the interior of the city, outside, to a distance of about four miles into the country; and of another, which opens into the Kedron valley from Bezetha. He explored all three of them partially; as far, *i. e.*, as the heaps of fallen rubbish choking them would allow him to proceed. He intimates no doubt of the accuracy of the reports concerning their extent; and, in addition to his own observations, one may remark an "evidence of congruity" between what he has discovered in this instance, and certain statements in Josephus' "War," which bear significantly upon our subject. It appears from the historian's narrative that even after Titus had built this wall round the city, the besieged must still have had some communication with the country. After every needful allowance has

been made for Josephus' exaggeration of their numbers, it remains certain that, for obtaining food, and for the interment of their dead in those summer months, they must have had such hidden means of exit as these long passages would furnish. The discovery, and the exploration of them, therefore, so far as it has been effected, verifies to this extent the historian's narrative; and now, his testimony, since it has been so far, unexpectedly, we may say, confirmed, may well be used as a motive and reason, additional to those which led Dr. Barclay to begin this enterprise, for carrying it energetically forward whenever there is an opportunity to do so. Let those passages then be cleared and searched, and can we doubt that treasures of inestimable value will reward the labors of the explorer, as he gropes and burrows in their deep recesses, even though he should fail in making his way through the whole of their extent?

But, coming now to the instances in which complete success has been attained, we will begin with the immense cavern which extends beneath the greater part of the north-east corner of the city. The sudden disappearance of his dog through a long, narrow hole under the outer wall near the Damascus gate gave Dr. Barclay the first hint of the existence of this vast excavation; but the difficulties and perils, especially from the jealousy of the Mahomedan authorities, of exploring it, hindered him for awhile from making the attempt. Soon afterwards, however, it happened that he had a visit from Nazir Effendi, "a State-Church dignitary only a few grades below the Pasha," and he, "admiring the fine view from the terrace of our house, remarked that ancient Jerusalem was several strata below the superficies of the present city; and that it would be interesting to explore the magnificent subterranean remains of the gorgeous palaces of King David, Solomon, and various other monarchs of former times, could an entrance but be effected." *Apropos* of this remark, Dr. Barclay asked of the Effendi permission to attempt an entrance into the cave which had so excited his curiosity. This was given; and the work being accomplished with fewer difficulties than they had counted on, they found themselves in an immense cavern, of about two acres in extent, which stretches in a southeasterly direction beneath the greater part of the intramural portion of Bezetha, on which that northern quarter of Jerusalem is built. They found, in fact, that they had entered the very quarry out of which the stones were excavated for the building of the temple; as was evident from these circumstances—first, that the excavation had been made for building purposes; second, that the detached blocks, of whose form and size clear traces were left in the places from which they were dug, perfectly corresponded in shape and material with those remnants of the old temple which are still

standing in the Jews' place of wailing, and at the south-east corner of the Haram; and thirdly, from the manifest evidence that the stones, taken from the quarry, were also *dressed* there, as was the case, we know, with those used in "the building of God's house, which was built of stone made ready before it was brought thither, so that there was neither hammer, nor axe, nor any tool of iron heard in the house while it was in building." "What untold toil was represented by the vast piles of blocks and chippings over which we had to clamber in making our exploration! . . . For centuries these intermediate halls had resounded to the busy din of the hammer and the chisel." Some of the blocks are only partially detached; they are left as if the mason would return in an hour or two, to complete his work; the marks of his chisel are discernible on all sides upon the walls; the broken pottery of his drinking vessels lies strewn upon the ground. Whoever enters that quarry is there brought into immediate contact with the industrial activity and enterprise of the remotest eras of Jewish history; and the impression produced by it is greatly deepened, or we may say, literally doubled, on finding that this spacious cavern, more than six hundred feet long and one hundred and twenty-five broad, and on an average about eight feet high, was originally continuous with the cave long known as the grotto of Jeremiah in the extramural portion of Bezetha. The road which now passes between them, marks a "cutting" of the hill that was necessary for the erection of the "second wall," which must, whatever supposition be taken concerning its remaining course, have surrounded the city in this direction. When one thinks of the hugeness of this mass of limestone, broken up and squared into blocks, such as those which are still visible in the ancient portions of the wall, the most vivid impression of the splendor and massiveness of the structures that adorned the city is produced; and one gets also, since of these structures, so small a portion is remaining, some conception of the thickness of those strata of chaotic ruins which cover the native rock, and fill and choke the ravines that, as we know, lay deep between the hills of the ancient city.

(To be continued.)

HISTORICAL SKETCHES AND REFLECTIONS.

BY S. M. JANNEY.

No. 1.

The study of history places before us the experience of former generations, and enables us to profit by the lessons they received in the school of adversity, without being subjected to the sufferings they endured. By this means we enjoy a privilege that compensates in some measure for the shortness of human life; for the accumulated wisdom of ages being placed within our reach, we may in this day attain to an advancement in

knowledge that would have required centuries of observation in the antediluvian world. It is true that many of the moderns who enjoy this privilege refuse or neglect the teachings of history, and are not satisfied until they find by their own experience that every infringement of the moral laws established by the Creator for the government of man, is invariably followed by degradation and suffering. This applies to nations as well as individuals, for the only basis of lasting tranquillity and happiness is found in obedience to the laws of God.

To investigate and portray the manners and customs of nations, to trace the changes in religion and their effects upon morals, to note the state of education and the progress of liberty: these are the important purposes of history. But how often has the historian overlooked these subjects, which concern the great mass of mankind, confining his attention chiefly to the disgusting details of war, and the narration of political intrigues. The heroes of antiquity, who pursued the trade of robbery and murder in the devastation of kingdoms and the butchery of nations, have always had their admirers among the unthinking, and their exploits are blazoned on the page of history; while the inventors of the useful arts, the pioneers of science, and the reformers of morals, have too often been neglected in their own age and forgotten by posterity. There is, however, an improvement of taste beginning to prevail, and I trust the day is not distant when human actions will be weighed in a more impartial scale, and admiration of military glory will be superseded by a just appreciation of the Christian virtues.

The earliest records now extant are the writings of Moses, which, according to the generally received chronology, were composed about 1500 years before the Christian Era; but according to Josephus, who wrote in the latter part of the first century, the law of Moses had then been in existence 2000 years.

The Book of Genesis contains the only satisfactory account we have of the creation of the world, the formation of the first human pair, the destruction of nearly all their posterity by the Deluge, and the re-peopling of the earth by the descendants of Noah.

In the time of Josephus, there were still extant the works of several ancient authors, who wrote concerning some of the most important events recorded by Moses. Among these authors were Manetho, who wrote the Egyptian history, and Berosus, who collected the Chaldean Monuments.

These writers and others were appealed to by Josephus as corroborating the Mosaic account of the deluge, and the great age attained by some of the antediluvians.

On comparing the books of Moses with the oldest of Pagan writings now extant, all reflect-

ing minds must admit the immeasurable superiority of the former. The mythology of the Greeks is a tissue of the most extravagant fables, in which the vices of humanity are attributed to the gods, and examples of licentiousness and crime are thus held up for the imitation of mankind. Their ideas concerning the creation of the world and of man were no less erroneous and absurd than their conceptions of the divine nature. It is only in the graphic and sublime description of Moses, that we find a narrative of creation that satisfies the reflecting mind, and does not contradict the latest discoveries of science.

It is true that we cannot gather from his narrative a knowledge of those geographical and astronomical truths discovered by modern science; his object was not to teach science, but religion; and he describes in simple but sublime language, those wonderful changes wrought by divine power, on the surface of our globe in the course of long revolving ages. It is observed by Professor Silliman that there is a remarkable "coincidence between the order of events as described in Genesis, and that unfolded by geological investigations."

It is generally admitted that the six days of creation were periods of indefinite length, probably extending through many centuries, and there are several passages of scripture showing that the word translated day, will bear this interpretation. It is very remarkable that this view of the subject was taken by Thomas Story, a prominent minister in the Society of Friends, more than a hundred and twenty years ago, and before geology was known as a science. In a letter to James Logan of Pennsylvania, dated London, 12th mo. 8th, 1738, after alluding to his visit to Yorkshire, he thus continues: "Where I spent some months, especially at Scarborough, during the season attending the meetings, at whose high cliffs, and the great varieties of strata therein, and their present positions, I further learned, and was confirmed in some things; and that the earth is of much older date, as to the beginning of it, than the time assigned in the Holy Scriptures, *as commonly understood*, which is suited to the common capacities of human kind, as to six days progressive work, by which I understand certain long and competent periods of time, and not natural days, the time of the commencement and finishing of all these great works being undiscoverable by the mind of man, and hid in that short period, 'In the beginning God created the heaven and the earth.' And then the author goes on to set forth the further modifications of the terraqueous globe; and I conjecture, very long after it had its being with the rest of the worlds."

About fifty years ago, Doctor Chalmers, then a young man, ventured to say in one of his lectures that "The writings of Moses do not fix the

antiquity of the globe." This sentiment was then considered an evidence of no small courage in a divine of any established church, but it has now become the settled conviction of nearly all who have examined the subject.

"In the beginning God created the heaven and the earth." In this brief but expressive sentence, no date is assigned for the first act of creation; it is only when man appears upon the scene at the close of the sixth day, that our chronology begins.

The late Hugh Miller, who stood in the first class of geologists, in his last great work, "The Testimony of the Rocks," has shown conclusively the general agreement between the "two records" of creation, "the Mosaic and the Geological."

As the inspired author of the "Revelations," looking forward, beheld in successive visions the future history of the church, so the inspired author of Genesis, casting his glance backwards through the long vista of departed ages, saw in the vision of light the successive epochs of creation.

First, he beholds the light dawning upon the void waste of waters that cover the globe. Neither sun, moon, nor stars can be seen through the steaming vapors that arise from the tepid ocean; but a gray diffused light appears in the east and gradually spreads to the western horizon. Secondly. The dense vapors collect in the form of clouds, which roll in dark masses in the upper regions of the atmosphere, and thus the waters above the firmament are divided from the waters of the ocean beneath.

Thirdly. Continents and islands, emerging from the ocean, become dry land, and the earth brings forth grass and herbs and fruit-bearing trees.

Fourthly. The clouds and mists that had enveloped the earth are dispersed, so that the sun appears in splendor as though it were just created; the moon's pale crescent hangs in the western sky, and as the evening advances, the stars shine out from the blue depths of the firmament.

Fifthly. The waters bring forth abundantly, the ocean teems with life, fowl in vast flocks darken the air, and reptiles of gigantic size creep along the shores.

Sixthly. The earth "brings forth the living creature after his kind," cattle are grazing on the wide savannas, beasts of prey are roaming through the dense forests, and every form of animated nature seeks its appropriate food.* At length man appears upon the scene, created in the divine image, the crowning work of omnipotence; for, though his body was framed of earthly materials, he was created a living soul, destined for immortality, and qualified to hold converse with his Almighty parent.

* See "Testimony of the Rocks," which contains a more extended and beautiful description of the successive epochs of creation.

The beneficent Creator saw that it was not good that man should be alone, and therefore he made a help-meet for him. The account given in Genesis of this last act of creation is beautifully adapted to illustrate the endearing nature of the conjugal relation and the equality of the sexes.

It has been paraphrased in the following lines:

"Nor yet was Adam in his bliss complete
Till from himself was formed a partner meet;
Not from his head the beauteous vision came,
Lest she presuming, should dominion claim;
Nor yet ignoble, from his feet, her birth,
Lest he should trample, and despise her worth;
But from his side, and next his throbbing heart,
Fair woman's form did heavenly love dispart,
And gave to man to cheer his path below,
An equal partner of his joy or woe."

During these successive stages of existence, the earth had undergone great changes and convulsions; but after the creation of man a new era began, the globe was fitted for the habitation of the human race, the face of nature subsided into repose, and the Creator appeared to rest from his works in the physical world. Under the Mosaic dispensation, the seventh day was therefore kept as a day of rest; it is also typical of that sabbath of the soul which results from the work of redemption, bringing forth in man a new creation of holiness. "There remaineth, therefore," says the Apostle, "a rest to the people of God, for he that is entered into his rest hath ceased from his own works, as God did from his."

FRIENDS' INTELLIGENCER.

PHILADELPHIA, THIRD MONTH 19, 1859.

The interest and sympathies of those who deplore human wrong and suffering in every form, have been recently awakened on behalf of the remaining tribes of Indians still inhabiting our western frontier, by the public addresses on their behalf of John Beeson, who has resided for some years in Oregon Territory, and who has had opportunities of observing and knowing the wrongs and injustice to which they are subjected. We think few could listen to the simple but forcible appeals of their advocate, or mingle with him in private, without being impressed not only with his single-mindedness, but with the persuasion that he believes himself called upon, by an imperative sense of duty, to plead this unpopular cause.

The wrongs done to the Indian are not alone those perpetrated by border ruffians, and corrupt government agents, but lie deeper in the erroneous public sentiment which denies him the feelings of a man, and his claim to justice and

humanity. Mingling, in many of the frontier settlements, with a population of whites to whom the term *savage* would be much more applicable than to the Indian in his native State, they become corrupted by the contact, and are then hunted and shot down like beasts of prey.

John Beeson, who has had opportunities of intercourse with some of the tribes who have escaped the contamination consequent upon mingling with a depraved white population, does full justice to their noble traits of character, their sense of equity and honor, their grateful sense of kindness, their hospitality and chastity. Even in the matter of *politeness*, their self-control, and deference for each other, might well be imitated by what we are pleased to call *civilized* communities.

John Beeson has published a small book, called "A Plea for the Indians, with facts and features of the late war in Oregon;" in which some plans are suggested for their welfare and improvement, which, if carried out, would save the remnant of a once powerful people, and our country the guilt of their extermination. He combats the idea which so generally prevails, that the Indians are doomed to disappear before the march of civilization, as an anti-Christian sentiment, held by those who believe that might constitutes right; and also by the indolent and desponding, who refuse to do the little that is in their power to arrest the torrent of evil, which is fast sweeping them away. Although the views of the writer of this little work, are so far in advance of the policy hitherto pursued towards the Indians, that they may appear to some almost Utopian or visionary; yet his confidence is unshaken, that the earnest co-operation of all those who deeply feel the subject, will at no distant period accomplish the desired result. One of the means proposed is the publication of a paper called the *Calumet*, by which the public may be informed of all matters connected with the Indians; a mouth piece, in fact, through which the *red man* may speak to his white brethren.

Not alone on account of the wrongs of this injured people, should every good citizen desire that justice may be done them, even at this late day, but in order to avert the reaction of suffering to ourselves and our posterity, which must certainly follow upon the continued violation of the laws of justice and humanity.

We understand that Associations have been formed in New York and Philadelphia, with the object of carrying out the beneficent measures proposed.

We give an extract from the work alluded to, which will show the views of the writer on the subject of the religious instruction of the Indians.

EXTRACT FROM "A PLEA FOR THE INDIANS."

There is a prevalent belief that the Indians are doomed to fall away and perish from the track of Civilization—that it is in the order of Nature; and, therefore, it is not worth while to attempt to save them. But let us enquire what destiny or law of nature can exist for such a purpose. The approach of civilization does not annihilate or poison the natural elements. Earth, air, and water continue the same; and therefore altered nature does not destroy. And even if civilization was forced upon them, so as to bring them at once under its conventionalities and restraints, even this change, great as it would be, could not, in my humble opinion, cause destruction. It is a well-known fact, that animals become acclimated and live in extremely unnatural conditions; while it is admitted on all hands, that man has the power of acclimation, and adaptation to ungenial circumstances, in a far greater degree than any of the inferior animals. I will, then, venture the assertion, that it is not Civilization that destroys, but the more highly energized Savageism that creeps under its mantle, usurps its prerogative, and does unspeakable wrongs and mischiefs in its name. In short, it is that same spirit that has no independent absolute integrity, but, by its own confession, disregards treaties, and tramples them under foot, whenever it can do so with impunity. Let us look at the plain facts, and see if this is not so. We have robbed them of their lands; we have invaded their homes; and while we have refused them sufficient protection from our own, we have withheld from them the right of self government. We have appropriated every choice spot west of the Mountains, for our own use, and, in many instances, have put them under the control of agents whose acts declare them the enemies of the race. Let me illustrate this by an anecdote. I inquired of a gentleman in relation to the Reserve, on which they were collecting the Indians; and he answered that it was "*only fit for a Reserve.*" By this I inferred that the country was of such a character as neither Whites nor Indians would choose to live upon. Need we wonder that the Indian Tribes pine away and die, when we see them crowded together in a small compass, consisting chiefly of hills and ravines unfit for culture, and therefore alike ungenial to the savage and the civilized?

Let us imagine what would be the chance for

longevity, if the inhabitants of any of our cities were compelled to move, *en masse*, and take up their abode within some circumscribed limits of our mountain ranges, which are not yet occupied by man, and where the passes are all guarded by forts, and armed by hostile soldiers to prevent escape. Let us fancy them cut off from all the world, deprived of their liberty, and, though supplied with food, yet of a different and less congenial quality than their accustomed diet. Let us think of them thus confined, without local attraction, without occupation, without motive for exertion or encouragement to improve, and all these evils enhanced by the oppressive and debasing consciousness of being hated and despised by the whole world.

And for the sake of the argument, setting aside all extra acts of oppression, robbery, and murder, whether single or wholesale, who does not see that a people thus placed, without commerce and without hope, would soon deteriorate, and under the influence of wasting diseases forced upon them from without, would gradually perish from the earth? Yet these circumstances certainly are not the essential attributes or adjuncts of Civilization, but absolutely the reverse. In all these facts, and many more like them, there is direct proof, that whenever a savage tribe declines and subsides from the path of a more highly advanced people, it is not owing to the civilization, but because of the more strongly-armed selfishness which it organizes, and carries along with it. To this, then, the remedy should be applied; and being so, it would be felt to the very heart's core of our own people.

The Indians also labor under another difficulty, not less formidable than the last-mentioned, and that is, the cold indifference that is felt toward them, on the ground of their obstinate unbelief. Knowing this, as I do, I should not be just were I to omit a plea for them in this particular.

Let us for a moment consider, that, although the Indians may not have a Bible, or a knowledge of the Written Word, it by no means follows that they are destitute of divine inspiration and of religious principle; for we should bear in mind, that they who wrote our own Bible, had, previously, none to read. And yet we learn that Enoch walked with God, that Abraham was the friend of God, that Moses observed the Law before it was written, and that men of old were moved by the Holy Ghost, before Propheis spoke. Thus we have the strongest proof from the Bible itself, that inspiration, and the knowledge of God, are not derived from it alone.

Moreover the Scriptures plainly declare that there is "a light that lighteth every man that cometh into the world," and that "God is no respecter of persons." What presumption, then, it must be, to suppose that the Indians are purely savage, and to treat them without any regard to

their religion, their conscience, or their sense of moral right.

It is true that their creed is not written in a book; neither have they temples built with hands, nor any idea of a Triune God, or of a Mediator through whom to approach and conciliate the Majesty on High. But they have, on their own mountains and valleys, the same Presence that dwelt with Moses, and Daniel and the Prophets on the mountains and valleys of Palestine. The bright sun and the fertilizing rain, are, to their simple minds, ministers of blessing. They look up to the blue canopy and meditate on the starry heavens; they bask on the sunny hill-side, or recline under the spreading trees; they retire into the deep aisles of the forest, and find there God's solemn temples, where the babbling brook, the sighing zephyr, and singing birds, all have ministries of love and worship; and with them they unite, in adoration of the Great Spirit, whose informing presence animates the whole, and in whom the Indian, as well as the Christian, lives, and moves, and has his being.

They have, then, a faith, and a creed, and the book of God, as revealed in Nature, always open before them. They read, and reflect, and have imbibed a Theology, that is not only sacred to them, but has also that vital element which we suppose belongs exclusively to religious faith; for it is a source of hope in trouble, of courage in conflict, and of triumph in death.

In short, for many reasons, our religion is to them not only incomprehensible, but revolting and absurd; and not merely this is true, but the conduct of those who offer it, in many cases, affords the strongest arguments against it. Indians are quick to perceive that the White Man's Book will be of no benefit to them, since, with the sacred volume in their houses, and its precepts in their mouths, they are despoiled of their possessions, and driven from their homes. They can not perceive the superiority of a religion, whose professors are not only robbing and murdering, but destroying them with debauchery and drunkenness. How should they—how *could* they—if they have any sense of right or truth in them, turn from the religion of their fathers, and from the hope of their whole lives, for a system that is incomprehensible to their intellect, subversive of their interests, and, to the last degree, odious and revolting to their moral consciousness and native nobility of soul?

We shall be better able to appreciate the force of their objections, if we only think how we ourselves should feel, if a more powerful people should take possession of our country, spread themselves in overwhelming numbers over our cities and villages, devouring our substance and treating us with contempt, and at the same time requiring us to forsake our religion, demolish our churches, tear down our school-houses, and adopt a faith which we could not comprehend,

and ceremonies and habits which we could not approve. Would not all this be to us what it has heretofore been to the natives of this continent, as well as to the Islanders of the Pacific, a violence, a sacrilege, and a death-blow?

Now as there is a certain correspondence and relationship in all things naturally associated, it follows that human beings must be somewhat in accordance with the surroundings of their nativity and growth. Hence, geographical characteristics make an impress upon the inhabitant of every clime. It is, therefore, not possible, that the Indians, inhaling as they do, an atmosphere of resplendent purity, and surrounded by objects of loveliness, of which they are close and attentive observers, *can* be without high aspirations, and the elements of intellectual and moral power considerably developed. When first visited by the Whites, they were a numerous, but healthy and happy people divided into Tribes, each held within its own acknowledged limits, but all united for general defence and common national interests. They had their laws and officials, and a government adapted to their circumstances. They were credulous, hopeful, and anxious for improvement. So much, indeed, did they desire this, that, years ago, the churches were electrified by the news that a delegation of Indians from West of the Rocky Mountains had come to the States for religious teachers. Who can conceive the extent of that sacrilege, when vice and depravity, in all their horrid forms, stalked forth into such a country, and among such a people!

The Indians have their own myths, it is true; but they are eminently spiritual; and we should not condemn them because they are so constituted as to demand rational solutions of whatever is presented to them as truth. They read intelligently the writing of the Great Spirit in all exterior nature, as well as in the human soul. The tints of the flower, the cells and fibres of the leaf, the granules of the rock, and the veins of the wood, are poems—hymns—sermons—not of unmeaning and lifeless words, that fall coldly on the ear, like flakes of spring snow, only to dissolve and pass away, but living utterances of that great Interior Life which, in all they see, and hear, and know, they recognize, and honor and adore. This great sentiment of veneration, which is, in itself, a fountain of love and praise, pervades the whole character of the true Indian. It informs, it inspires, it exalts him. Think, then, how impossible it must be for him to exchange this august worship, that has grown with his growth, and strengthened with his strength, for any of those dogmas, which are so far from satisfying Christianity itself, that they have cut into the very heart of the church, dividing it into hostile factions, armed with deadly hatred against each other, until its history, in almost

every age, has been dyed crimson with the blood of the faithful.

Let us, then, first seek to conciliate each other, that we may meet on some common ground of toleration and goodfellowship before we dare to brand the Indian as a heathen, because he questions any or all of those dogmas that are bandied about from sect to sect, and made brands of contention throughout all Christendom.

I would recommend that all mysticism in Theology should be kept entirely away from them, and that they be taught only plain, practical, Christian truth. Let us give them, not only in words, but in all our actions, the spirit of the Golden Rule. This they can easily appreciate, and will be ready to accept, because its law is not one-sided, but mutual; for in requiring me to be just and kind to all, it equally requires that every human being should be just and kind to me. If this teaching had no direct practical advantage, it would yet be of inestimable value, as a means of unfolding the higher faculties; and opening fountains of pure and exalted pleasure, it would at once develop and satiate with its own proper enjoyments the true nature of man. I submit that if this Rule should be taught, not only to the Indians, but to other people, as a cardinal doctrine, instead of some others which are considered as such, it would be a vast benefit to all mankind.

Setting aside all special applications of faith in creeds, we believe and know that our great Teacher and Exemplar went about doing good, not only rebuking sin in high places, but healing the sick and binding up the broken-hearted. He preached "deliverance to the captive, and the opening of the prison-doors to them that were bound," and finally laid down his life to confirm and seal his doctrines, thus literally becoming the Saviour of men. And if those who profess to be his followers had gone up and down the valleys of Oregon, imbued with a spirit akin to that which he manifested in traversing the mountains and valleys of Judea, what different results should we now have realized! But so far were many of his representatives from exhibiting his spirit, that if he could have appeared there bodily, with his own Gospel, just as he taught it eighteen hundred years ago, they would have been among the foremost to urge a second crucifixion; for by generally taking part against every principle of humanity, they have virtually confirmed this declaration. Christ himself declares thus concerning similar circumstances, "Inasmuch as ye have done wrong unto the least of these, ye have done it unto me." I can not, therefore, do otherwise than repeat my solemn conviction, that the pure Gospel has been but partially preached, and that the Indians have never had any thing worthy of its name.

The fit word must be fitly spoken.

DIED at Rochester, N. Y. on the 11th of 2d mo. last, PATIENCE, wife of Samuel S. Waring, aged about 70 years. In the decease of this beloved friend our society has lost one of its valuable members. She was a pattern of humility and simplicity, and filled with propriety the various relations of life, being an affectionate wife, a tender parent, a kind and sympathising friend, and a meek and devout Christian. T. H.

—, at Dunning's Creek, on the 2nd inst., AMANDA JANE BLACKBURN, daughter of Hiram and Mary Ann Blackburn, in the 7th year of her age.

—, on the 24th of 2nd month last, ABBY ANN FOULKE, in the 43d year of her age. She was an exemplary Friend and a useful member of Richland Monthly Meeting.

—, on the 11th of 2nd mo. last, HANNAH F. CUSTARD, relict of the late George Custard, aged 69 years, a member of Richland Monthly Meeting.

—, on the 25th of the 2nd month last, JANE STRAWN, aged 79 years, a member of Richland Monthly Meeting.

—, at Newtown, Bucks Co., on the evening of the 7th inst., MARY K., wife of Thos. Janney, aged 53 years.

THE MISSION OF THE DEW DROP.

What is the mission of the dew-drop? For what purpose is the crystal gem sent from its home on high to pillow its bright form on the lowly lap of earth? We say, to cause freshness and beauty to each, plant and tree.

Who can wander abroad in the pure morning hour, and see the tiny flower and spear of grass, bathed in dew-drops, sparkling in the golden rays, and not feel the beauty and wisdom there is in this vast creation. When the king of day has sunk to his western couch, leaving all nature glowing in his farewell smiles, then twilight's soft dews nestle closely in the hare-bell's cup and the violet's bosom. All day long has the sun poured his rays abroad o'er the earth, parching the verdure, but as evening shades descend, down comes the crystal draught from heaven, to revive the withered plant.

But is there not another mission which the dew-drop has to perform, other than its mere physical use? Can it not convey a lesson to the mind? Yes, if we are willing to receive instruction from so small an object, we may cull stores of knowledge, even from a dew-drop.

Do we not see how each little drop sinks in the bosom of the flower, revives and strengthens it, and know we not that one little act of kindness, one word of love, "dropped in the heart's deep well," may call a sorrow-stricken soul back to joy again? We need not think that a kind word of ours is too trifling to perform its mission of good; for we see that each dew-drop helps to form the refreshing balm, and we know not how far its influence may extend. Perhaps the lordly oak would not have waved so proudly if the dew-drop had not first glittered on the ground that held the acorn's cup. We know not the potent influence one little word may have on some lonely heart. No act falls fruitless—no

gentle soothing word escapes our lips—but finds a resting place in some bosom.

There is a chord in the human breast that is capable of vibrating the faintest note, and it joys to echo the melodious tones of love; but so susceptible is this delicate chord, that the harsh note falls heavily upon it, and repeated jars may sever the golden string. The word of kindness and gentleness, will ever be as strains of heavenly music, floating around the path of life.

May we take the bright dew drop for our example, and like it dispense freshness and life wherever our lot may fall. Yielding our mite, with the assurance that God will ever be with those who are true to their trust.

Like the dew-drop, may we remain uncontaminated by the things of earth, and be able to dispense our blessings among the poor and lonely, without imbibing the sins of this world. Then when our mission on earth is ended, and others come to fill our places, may we shine more bright and beautiful in that land where the dews of heaven ever bathe the flowers of eternal bloom.

1st mo. 1859.

THE LAMENT OF A FEMALE CONVICT OVER HER CHILD.

Hush—hush my babe; thy mother's bosom
Not long shall pillow thy dear head,
No tender arms with fond endearment,
Will fold thee, sweet, when I am dead.

Hush—hush those cries, my only treasure,
It wrings my heart thy tears to see,
Who, when my forfeit life is taken,
Who, hapless babe, will weep for thee?

Those tender cries, ah! who will hear them,
None love the convict's orphan child—
And though for thy dear sake I perish,
Alas! for mine thou'lt be reviled.

Thy little limbs were almost frozen—
On me was fixed thy asking eye,
The means to save thee were before me,
And oh! I could not see thee die.

Perhaps 'twas wrong—my brain was turning,
I knew not then the wrong from right,
I only saw my child expiring,
Oh! 'twas an agonizing sight.

Must I, must I leave thee dearest;
Is there no kind hand to save,
None to snatch thy wretched mother
From an ignominious grave?

No, their hearts are steeled to pity,
Yet they their reward shall reap,
And though I mourn their cruel sentence
'Tis not for myself I weep.

In the grave this aching bosom
Shall be no more by cares deprest,
There the wicked cease from troubling
And the weary are at rest.

But for thee! what ills await thee!
Lone, unfriended, thou wilt roam,
Not a heart to heed thy sorrow,
Not a spot to call thy home.

But though by man thou art unheeded,
 For thy mother's crime reviled,
 God above, who sees my anguish,
 Will protect my orphan child.

Thou who judgest all uprightly,
 Thou who hears the captive prayer,
 Father, take my soul to Heaven,
 Grant my babe may meet me there.

AMERICAN GEOGRAPHICAL AND STATISTICAL
 SOCIETY.

The stated monthly meeting of this society was held last evening at the Historical Society rooms, when ABRAHAM GESSNER, M. D., delivered an address upon "The Fisheries of North America." He said that the fisheries in our northern waters adjoining Newfoundland were first discovered by Sebastian Cabot. For a time France claimed several of the islands as fishing grounds, but after the Conquest of Canada nearly all were surrendered to the British. The treaty made with Great Britain after the Revolution gave the United States right to fish in these waters, but not to go on shore to cure the fish in these harbors. The treaty of 1818 gave us the right to fish in all the waters within three miles of the shore, and to go into the harbors for repairs. But since 1851 the American fisherman can take his fish anywhere except in the rivers. These deep sea fisheries do not decrease like those in the rivers and estuaries when civilization and commerce have driven the fish away. The power of reproduction in these deep-sea fish is remarkable. In examining the different varieties he had found in the cod, 62,000,000; in herring, 58,000, and in the mackerel 70,000. In speaking of the Gulf Stream, he said that it was probable that Newfoundland and the adjacent islands were formed by this immense mass of moving water. The fisheries commence at about the latitude of New-York, or about 40°, and extend north to the Polar Sea. The fishes of the north differ from the south—those of the south being generally high and brilliant colors; those at the north are generally black or dark. Taking the dividing line at about 40°, the fish are more valuable as they go northward. Mr. Gessner gave a description of the various kinds of fish that frequent our shores, both of north and south, and of the modes of taking them; referring to the early French settlements in the islands that abound in the fishing grounds, and the present British fishing places; and also referred to the difficulties that had occurred between America and England about the fisheries. In many cases the English cruisers had been more lenient towards the American fishing vessels that were violating the law than the American war vessels themselves. He referred to the great gulf of the St. Lawrence, which is, perhaps, one of the best fishing grounds in the world, except Newfoundland, which is the very paradise of all deep sea fishermen—here

are these vast shoals of cod and other fish, where our sturdy sailors procure such great quantities of these inhabitants of the deep.

From the London Times.

DR LIVINGSTONE'S EXPEDITION.

The following letters have been received by a gentleman in Glasgow from Dr. Livingstone:

"Steam Launch Ma-Robert, River Zambesi, }
 June 23, 1828. }

"My dear Sir,—By the departure of the colonial vessel Pearl I am enabled to communicate with my friends at home by the overland India route, and I have much pleasure in informing you that we have been very clearly favored with weather ever since we left Liverpool. I feel thankful for the mercy which has watched over us, for, with the weight on our deck, a gale would have wrought a fearful stramash. I was obliged to part with Mrs. Livingstone and Oswell at the Cape, but we there met Mr. and Mrs. Moffat from Kuruman, and she will go with them thither, and afterwards join me by the overland way beyond that. This we felt to be a trial, but now see it was for the best, for the Portuguese and natives are at war, and cannot pass up the river. You are aware that I did not see the lower portion of the Zambesi, but left it at Mazaro, a place 70 miles from its mouth. This lower part had to be all explored, and that took up about a month, from the number of mouths it possesses. We found a very good bar and harbor at the river or branch by which we entered. It is called Kongone, and has ten mouths, if I may so call them, sucking water by them out of the main stream. One of these is a natural canal, five miles long, through which we entered the Zambesi. Our ship, the Pearl, was a screw, and would not back readily, and was quite too deep for exploring. We were, moreover, hampered by very stringent orders not to run any risk of detaining her in the river, but rather land our goods on an island, and send her off. This we have done, though with a paddle-steamer of five or six feet draught we could have gone to Tete. We are below Mazaro, and next week will go to Tete, where my men are waiting for me. It is said that many of them have died of smallpox, a disease unknown in their own country; but the rest have purchased pigs, goats, and poultry with their earnings, and refuse either to slaughter or sell them till I come. We went up to Mazaro in the Ma-Robert, and encountered the enemy, consisting of 200 well-armed natives (with Tower muskets). We approached them slowly, and, when within hail, I called out that we were English, and pointed to the English ensign. They gave a shout of joy, and we soon saw them running down with bananas for sale. We mean to keep free of the quarrel on both the native and Portuguese sides, and get away beyond them as soon as possible.

My brother found very good cotton in the delta; but all complain that wars ruin their cultivation. Of the river I can now speak with confidence, as I had the company of three naval officers. It is generally from 1,000 to 2,000 yards wide; but when it has islands it spreads out to two and a half or three miles. These are the worst parts; in the narrower parts we have from three to seven fathoms. In these broad parts a channel of two or two and a-half fathoms can be found only by searching. One of my friends remarked it was more like an inland sea than a river. I shall adhere to the opinion I have all along expressed, that a vessel drawing from four to six feet water could run upon it during seven or eight months of the year with ease. We all enjoy good health, no case of fever having appeared among us, and we have been in the delta five weeks. But this I knew beforehand to be the healthy season, or winter, and selected health in preference to a full river. "I am, &c.,

"DAVID LIVINGSTONE."

"Tete, Sept. 14, 1858.

"My dear Sir,—I wrote you a long letter by the Pearl, but, unfortunately, by some mistake it was unsent, so I have now to tell you that we spent some time getting a proper entrance into the Zambesi, as the main entrance seemed unsafe. We entered by a side branch, and having been about a month exploring the delta, and the river falling fast, it was resolved to land all our goods on an island, and carry them up by successive trips in our small steam launch. This we have been doing as fast as we could. This you are aware of probably ere this, and possibly also of the very favorable opinion respecting the value of of this river expressed by the two naval officers who accompanied me. I see it now several feet lower than they did, and as it is spread out in many places below Lupata to from one to three miles in width, you may be sure we have difficulties in finding the deep channel. Formerly I believed, from what the Portuguese told me, that this river was navigable during only six or eight months in the year. I now believe that it could be navigated with one of the 30-inch steamers ten months, if not the whole year. When we got to Lupata, where the river is no longer divided into many channels, our difficulties in navigation ended. Here the gentlemen at once yielded to my suggestion, and dug out a ton and a-half of coals, the very first ever taken out of the earth in this country. Mr. Rae, a Glasgowian, pronounces them to be good, and promising better, as they are got from the surface in the bank of the Muatoze, where they have been exposed to the action of floods and atmosphere for ages. There is an immense coalfield here, and many of the seams crop out. With coal, and the best iron ore in abundance, surely Africa will not al-

ways be the trodden-down nation it has been. Our vessel was the first that ever steamed at Tete, and we were visited as if we had been another Leviathan. The country was in a state of war, and no Portuguese durst pass, but we did, our passport being the English name. This is against our prospects, for everything stands still, or goes back, when war rages. We had gone from the Portuguese to the native side, from time to time, unmolested, being equally friendly to both parties. Many of the officers wished to accept my mediation, and the rebels all did, but the Governor would not give in. A decisive blow is to be struck soon, but the rebels being mostly runaway slaves, they will hold out. Two who acted as pilots on board once wanted me to buy them, to get out of the scrape. It is sad to see so fine a country in this state. We meet some very fine cotton growing wild wherever it has once been sown. It is long in the staple, and has been introduced, as its name imports. The other has a short strong staple which clings to the seed, and is more like wool in the hand than cotton. We have also more lignum vitæ than ebony, but I must leave all these things to be reported on by my companions. My men were still at Tete, though 30 of them had died of smallpox and six had been killed by a neighboring chief. The poor fellows received me with great joy, and no less glad was I to see them. All the party is now well. We have had illness, but no coast fever. I think, as both we and the Pearl escaped, it was greatly owing to pushing with all our vigor away from the mangrove swamps at the mouth of the river. These are the hotbeds of fever.

"I am, &c., DAVID LIVINGSTONE."

INSTINCT OF LOCALITY IN ANIMALS AND BIRDS.

The instinct of animals, in many cases, is acknowledged to equal reason, if not to surpass it. Numerous anecdotes of this faculty are recorded, from White's Selborne down. The instinct of locality is one more or less familiar to every observer of nature. Whoever has bird-houses about the house must have suspected that the same wrens and martins come, year after year, to build in the same place. We know of a lady, who, desirous of testing this, selected a blind wren from several who built about her dwelling, and was careful to notice, the spring following, if he returned, which he did. In the city of Reading, in this State, is a barber, who had erected several large bird-boxes, which in time came to be inhabited by hundreds of martins who, with their children, resorted thither annually. One year he moved across the street, taking with him his bird-boxes. When spring returned, the flocks of martins came back, but not to the new locality. They flew, as usual, to the old one, where they remained for a whole day, restless and lost,

though the boxes were only across the street. At last, however, they were induced to enter their old homes, shifted to the new locality; and now, year after year, the martins return, blacken the air at morning and evening, as they leave and return to their nests.

An even more curious anecdote of the instinct of locality has come to us from a highly veracious quarter. In the town of Franklin, in Venango county, once lived a gentleman, who was fond of bees. One morning he observed four toads sitting just below the hive. The next day the same toads were there, grave and solemn as sphinxes before an Egyptian temple. One was black; another bright-colored; a third blind; a fourth marked in some other distinguishing way. Thinking they annoyed the bees, and seeing they pertinaciously preserved their position, day after day, he put them into a basket, carried them across the Alleghany, and left them at the top of a hill. What was his surprise, three weeks after, to find them at their old post, as grave and solemn as ever! Again he removed them, taking them, this time, in a different direction, and leaving them at a point much further off. In about six weeks, however, they were back for the second time. A neighbor, to whom the incident was told, and who was incredulous, next tried to lose them. But in a few weeks the toads were seen, one morning, entering the garden, under the leadership of one of their number, who gave a "cheep, cheep," looked back for his suit, and then hopped on, followed by the rest, until he reached his old station under the bee-hive, where he gravely took up his quarters.

Every one familiar with the woods, knows how easily a wild bee can be tracked to its hive in the forest. If you take four bees from a city hive, carry them to as many points of the compass, within any distance that can be managed in an afternoon's drive, and then let them free, each bee will soar up into the air, and afterwards shoot, as straight as an arrow, in the direction of its home, where in due time, you will find it again. The instinct of dogs and horses, in finding their way back to their kennels or stables, when their owners, though endowed with reason, are hopelessly lost, has been proved by too many well authenticated instances to be doubted. The observation of instinct would be a pleasing and instructive recreation; and it is surprising that more persons do not devote their attention to it. To those living in the country the opportunities are so frequent, that the neglect of them seems little short of a crime. A man is always better for being brought into sympathy with the brute creation. The study of the habits of animals and birds enlarges the heart, and gives breadth to the intellect, as well as stores the memory with a vast variety of curious and instructive facts.—*Ledger*.

ITEMS OF NEWS.

INDIANS.—A letter has been received from Lieutenant Beale by his family residing here, dated at Santa Fe, on the 3d of 2d month last. He had just returned to that place from Taos, where he had been upon a visit of a few days to his old friend, Kit Carson, who returned with him. On his arrival at Santa Fe, he found despatches from his camp, stating that a delegation of chiefs of the Camanches—the formidable Indian tribe with which our government is now at war—had come in expressly to see and talk with him upon terms of peace and amity—that they had pitched their camp near his own, and having confidence in him, would await his arrival, and be governed by his subsequent action. Carson determined to accompany him to the council, and on the afternoon of the day they arrived at Santa Fe, they left for the plains to chat with the "Bedouins of America." What will be the result of the conference we shall know hereafter. We have entire confidence that any action on the part of Lieut. Beale and Kit Carson, as far as our Government is concerned, cannot but be beneficial. These Indians are a terror to emigrants passing through their country, and the United States mails are frequently stopped and robbed by them. Although Lieut. Beale is not invested with the peace making power, (officially,) we know his "talk" will have greater tendency to create friendship between them and our people than could be brought about by the entire Indian office at Washington. We look for important results growing out of this conference.—*Chester Republican*.

ABOLITION OF THE GRAND JURY IN MICHIGAN.—The *Detroit Free Press* says the act providing for the trial of criminals by information, goes into effect sixty days after the 12th of last month, at which time it becomes a law. This law virtually abolishes the Grand Jury, which has for so long exercised its inquisitorial functions, reserving for the Circuit Judge power to call it into session whenever special cases need its aid. All cases are to be examined before a Justice of the Peace, and by them committed directly to the higher Courts, instead of for indictment, as has previously been done.

SLAVERY.—Richard Randolph, a cousin of John Randolph, of Roanoke, died in Miami Township, Ohio, on the 31st of 1st month. The deceased, who was as eccentric as his more celebrated cousin, was an old bachelor, and had resided on the Randolph tract, O., for twenty-five years. He leaves a property, mostly in land, valued at \$80,000, to be expended in the purchase and freedom of the slaves now owned in the Randolph family, and those, with their offspring, formerly owned by the Randolph family, which slaves are to be set free; and if the estate is not exhausted in this purchase, the balance to be applied to the use and benefit of said slaves.

Four hundred and twenty-nine slaves belonging to Pierce M. Butler, a citizen of Philadelphia, were sold by auction at Savannah on the 2d and 3d inst., for the total amount of \$303,850. They constituted about half the number employed on two plantations, one of rice and the other of cotton, and were sold to pay their master's debts. Their ages varied from fifty years to fifteen days. They were mostly sold "in families," husband and wife, with their young or unmarried children, being disposed of together. The highest price paid for a single man was \$1,750 for a "carpenter and caulker;" for a woman, \$1,250 for a "cotton hand and house servant;" the lowest was \$250 each for an aged and sickly couple.

CHICAGO WHEAT STATISTICS.—The deficit in the receipts of wheat from the harvest of 1858 at this point, is stated by the *Commercial Express* of 10th inst., to have reached 5,286,900 bushels, compared with the

crop of the previous year. The total accumulation of flour and grain, last week, was equal to 73,000 bushels, against 145,000 for the same week of last year.

JAPAN.—Advices from Japan state that the new emperor has issued a decree relative to the fulfilment of the terms of the treaties recently concluded with foreign Powers. A liberal tone characterizes this document throughout. It permits the introduction of the Catholic religion into the ports of Simoda, Hakodadi, Nangasaki, and Desima, but stoutly refuses to permit the importation of opium—a favor which, it is said, the English had hoped to obtain from the new Emperor, after all negotiations to that end had failed with his predecessor.

A SLAVE in Cuba is not exactly the same thing as a slave in Carolina. He has some "rights which a white man is bound to respect." He has an owner, and the owner cannot refuse the purchase money. He may thus own the half of himself or the quarter of himself, in which case he becomes entitled to a proportionate share of his time and earnings. Once a year he is allowed a certain number of days to find a new purchaser, if his master ill treats him. He can have his children legally declared free, by paying \$25, in court, at the birth of each. Should Cuba be annexed, of course the "principles of the Dred Scott Decision" would apply to it, thus reducing its slaves to the level of cattle, like those in our Southern States. Such an abrogation of their privileges would be almost sure to cause an insurrection, and a bloody one. Both master and slave in the Island have reason to dread the day of "annexation."—*Germantown Tel.*

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market shows unusual firmness in prices. We quote sales of superfine Flour at \$6 44 a 6 50, and \$6 62 a 6 75 for extra family. The sales to the retailers and bakers are within the range of the same figures, and fancy lots at from \$7 25 to 7 75. Sales of Rye Flour and Corn Meal continue limited. The former at \$4 50. Corn Meal is held at \$3 75.

GRAIN.—The receipts of Wheat are slight, with fair demand. Sales of Southern and Pennsylvania at \$1 50 a 1 62 per bushel for fair and prime red, and \$1 70 a 1 75 for prime white. Rye sells as fast as received at 95 cts. Corn is in demand; sales of yellow at 85 a 86 cts. Oats are steady; sales of prime Pennsylvania at 57 cts., and Delaware and Jersey at 56 cts. No sales of Barley or Barley Malt.

Cloverseed continues in good request at \$6 50 per 64 pounds. Timothy commands \$2 12 a 2 25 per bushel, and Flaxseed at \$1 70 a 1 75.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON, } Assistants,
MAGGIE B. JACKSON, }
Address Kennet Square P. Office, Chester Co. Pa.
WILLIAM CHANLER, } Proprietors.
SUSANNA G. CHANDLER, }
3d mo. 19, 1859.—10 t.

ELDRIDGE'S HILL BOARDING SCHOOL FOR THE EDUCATION OF YOUTH OF BOTH SEXES.—All the branches of a liberal English Education

are thoroughly taught in this Institution. Also the French and Latin languages.

The summer session will open on the 3d of 5th mo., 1859, and continue 20 weeks, terms \$70 per session.

For full particulars address the Principal for a circular.

ALLEN FLITCRAFT,
Eldridge's Hill, Salem County N. J.

2 mo.

BOARDING SCHOOL FOR GIRLS, WEST CHESTER, PA.—In this institution, an opportunity is afforded of pursuing any of the various branches of science usually taught in the schools, and it is the constant object of the Principal, so to blend instruction, that while giving clear and practical knowledge of those branches, the mental and moral culture may keep pace with the acquisition of literature and science.

The domestic arrangements are as nearly as possible those of a private family, and especial care is taken to provide for healthful exercise in the fresh air.

Pupils should be provided with their own towels, soap, clothes-bags, over-shoes and umbrellas, and clothing should be distinctly marked.

The school year consists of ten months, commencing on the first 2d day in 9th month.

TERMS.—\$150 per year, payable quarterly in advance. The Languages, Drawing and Coloring, extra. Books furnished on rent or at the usual retail prices.

E. W. RICHARDS, Principal.

West Chester, 2nd mo. 8th, 1859.

ATTLEBOROUGH ACADEMY FOR RENT.—The present occupant, Sidney Averill, being about to remove to his farm in the State of New York, the Building and premises are for rent, situated in a healthy neighborhood, and thickly settled; the opening for a boarding and day school, with a competent Teacher, is seldom surpassed, as the experience of the present Teacher will show. His school, for three past years, averaging boarders and day scholars, 120.—Rent moderate. Apply to either of the owners of said Building, living in Attleborough, Bucks Co., Pa.

ISAAC LIVEZEY, JOSHUA RICHARDSON,
JAMES FLOWERS, M. W. ALLEN.

Attleborough, 2nd mo. 14th, 1859.

ORANGE GREEN BOARDING SCHOOL FOR GIRLS.—The Summer Term will commence on the 11th of 4th month next. The location is unusually healthy and pleasant; the course of study extensive and thorough. Terms Thirty-six Dollars per session of thirteen weeks.

For particulars, address Principals,
SIDNEY PUSEY, or
FANNY A. KINSEY.

Kennett Square, Chester Co., Penna.

2d mo., 1859.—2m.

BYBERRY BOARDING SCHOOL FOR GIRLS.—The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 21st of 2d mo. 1859, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

TERMS.—\$60 per session, one half payable in advance.

For Circulars containing further particulars, address
JANE HILLBORN,
1st mo. 22d, 2m Byberry P. O., Philada., Pa.

Merrihew & Thompson, Prs. Lodge street, north side Penna. Bank

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, THIRD MONTH 26, 1859.

No. 2.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONSIDERATIONS ON PURE WISDOM AND HUMAN POLICY.

BY J. WOOLMAN.

The wisdom that is from above, is first pure, then peaceable, gentle, and easy to be entreated, full of mercy and good fruits, without partiality, and without hypocrisy.—*James iii. 17.*

INTRODUCTION.

My mind hath often been affected with sorrow, on account of the prevailing of that spirit, which leads from an humble waiting on the inward teaching of Christ, to pursue ways of living, attended with unnecessary labor; and which draws forth the minds of many people to seek after outward power, and to strive for riches, which frequently introduce oppression, and bring forth wars and grievous calamities.

It is with reverence that I acknowledge the mercies of our heavenly Father, who, in infinite love, did visit me in my youth, and wrought a belief in me, that through true obedience a state of inward purity may be known in this life; in which we may love mankind in the same love with which our Redeemer loveth us, and therein learn resignation to endure hardships, for the real good of others.

"While the eye is single, the whole body is full of light" *Mat. vi. 22.* But for want of this, selfish desires, and an imaginary superiority, darken the mind; hence injustice frequently proceeds; and where this is the case, to convince the judgment is the most effectual remedy.

Where violent measures are pursued in opposing injustice, the passions and resentments of the injured frequently operate in the prosecution of their designs; and after conflicts productive of very great calamities, the minds of contending parties often remain as little acquainted with the

pure principles of divine love, as they were before. But where people walk in that pure light in which all their "works are wrought in God;" and under oppression persevere in the meek spirit, and abide firm in the cause of Truth, without actively complying with oppressive demands;—through those the Lord hath often manifested his power, in opening the understandings of others, to the promoting of righteousness in the earth.

A time, I believe, is coming, wherein this Divine work will so spread and prevail, that "nation shall not lift up sword against nation, nor learn war any more." *Isaiah ii. 4.* And as we, through the tender mercies of God, do feel that this precious work is begun, I am concerned to encourage my brethren and sisters in a holy care and diligence, that each of us may so live, under the sanctifying power of Truth, as to be redeemed from all unnecessary cares; that our eye being single to him, no customs, however prevalent, which are contrary to the wisdom from above, may hinder us from faithfully following his holy leadings, in whatsoever he may graciously appoint for us.

Considerations, &c.

To have our trust settled in the Lord, and not to seek after, nor desire outward treasures, any further than his holy spirit leads us therein, is a happy state; as saith the prophet, "Blessed is the man that trusteth in the Lord, and whose hope the Lord is."

Pure wisdom leads people into lowliness of mind, in which they learn resignation to the Divine will, and contentment in suffering for his cause, when they cannot keep a clear conscience without suffering.

In this pure wisdom the mind is attentive to the root and original spring of motions and desires; and as we know "the Lord to be our refuge," and find no safety, but in humbly walking before him, we feel an holy engagement, that every desire which leads therefrom may be brought to judgment.

While we proceed in this precious way, and find ardent longings for a full deliverance from everything that defiles, all prospects of gain that are not consistent with the wisdom from above, are considered as snares; and an inward concern is felt, that we may live under the cross, and faithfully attend to that holy spirit which is sufficient to preserve out of them.

When I have considered that saying of Christ, Mat. vi. 19, "Lay not up for yourselves treasures upon earth," the omnipotence of God hath often occurred to my mind.

While we believe that he is every where present with his people, and that perfect goodness, wisdom and power, are united in him, how comfortable is the consideration?

Our wants may be great, but his power is greater. We may be oppressed and despised, but he is able to turn our patient sufferings into profit to ourselves, and to the advancement of his work on earth. His people, who feel the power of his cross, to crucify all that is selfish in them, who are engaged in outward concerns from a conviction that it is their duty, and resign themselves and their treasures to him; these feel that it is dangerous to give way to that in us which craves riches and greatness in this world.

As the heart truly contrite, earnestly desires "to know Christ, and the fellowship of his sufferings," Phil. iii. 10, so far as the Lord for gracious ends may lead into them;—as such feel that it is their interest to put their trust in God, and to seek no gain, but that, which he, by his holy spirit, leads into; so, on the contrary, they who do not reverently wait for this Divine teacher and are not humbly concerned, according to their measure, "to fill up that which is behind of the afflictions of Christ," Col. i. 24, in patiently suffering for the promoting of righteousness in the earth; but have an eye toward the power of men and the outward advantage of wealth;—these are often attentive to those employments which appear profitable, even though the gains arise from such trade and business as proceeds from the working of that spirit, which is estranged from the self-denying life of an humble, contrite Christian.

While I write on this subject, I feel my mind tenderly affected toward those honestly disposed people, who have been brought up in employments attended with those difficulties.

To such I may say, in the feeling of our heavenly Father's love, and number myself with you, Oh! that our eyes may be single to the Lord! May we reverently wait on him for strength to lay aside all unnecessary expense of every kind, and learn contentment in a plain simple life. May we, in lowliness, submit to the leadings of his spirit, and enter upon any outward employ which he graciously points out to us; and then, whatever difficulties arise in consequence of our faithfulness, I trust they will work for our good.

If that, called the wisdom of this world, had no resemblance of true wisdom, the name of wisdom, I suppose, had not been given to it.

As wasting outward substance to gratify vain desires, on one hand; so slothfulness and neglect, on the other, do often involve men and their families in trouble, and reduce them to want and distress; to shun both these opposite

vices, is good in itself, and hath a resemblance of wisdom. But while people, thus provident, have it principally in view to get riches, and power, and the friendship of this world, and do not humbly wait for the spirit of Truth to lead them in purity;—these, through an anxious care to obtain the end desired, reach forth for gain in worldly wisdom, and, in regard to their inward state, fall into divers temptations and snares. And though such may think of applying wealth to good purposes, and to use their power to prevent oppression; yet, wealth and power are often applied otherwise, nor can we depart from the leadings of our holy Shepherd, without going into confusion.

Great wealth is frequently attended with power, which nothing but Divine Love can qualify the mind to use rightly; and as to the humility and uprightness of our children after us, how great is the uncertainty! If, in acquiring wealth, we take hold on the wisdom which is from beneath, and depart from the leadings of Truth, and example our children herein, we have great cause to apprehend that wealth may be a snare to them; and prove an injury to others over whom their wealth may give them power.

To be redeemed from that wisdom which is from beneath, and walk in the light of the Lord, is a precious situation. Thus his people are brought to put their trust in him; and in this humble confidence in his wisdom, goodness and power, the righteous find a refuge in adversities, superior to the greatest outward helps, and a comfort more certain than any worldly advantages can afford.

As a general thing, it may be expected that all Christians will find themselves able to bear the *great crosses* of life, because they come with observation; they attract notice by their very magnitude; and by putting the soul on its guard, give it strength to meet them. But happy, thrice happy is he, who can bear the *little crosses* which ever lie in wait, and which attack us secretly, and without giving warning, like a thief in the night.

For Friends' Intelligencer.

REMINISCENCES OF ISAAC PARRY.

FURNISHED BY J. F.

(Continued from page 804.)

Some time before the division of our Society, our ancient Friend Elias Hicks visited the meetings in these parts. I had heard complaints of his undervaluing the Scriptures, and I wished an opportunity with him, which I obtained in a friend's house. I approached him with diffidence, and asked his views respecting the Scriptures. He met the inquiry with much freedom, and said, "I believe the Scriptures. A large portion of them have been revealed to me in the light of the gospel; they are mine. Some oth-

er parts of them have not been so opened to me, they remain under the cloud, but there is no part that I dare to deny, for it requires as strong evidence to deny a proposition as it does to affirm it; but a position that has stood the test of so many ages and generations, requires infinitely stronger evidence; nay, it seems out of the question with me, for I yet remain open to receive instruction; and those portions that now remain under the cloud, may yet be opened to me in the light of the gospel."

I apologized for troubling him with such questions, when he pleasantly remarked that he met it with pleasure. "There are," said he, "many cavillers, who do not want to be satisfied, and I will not spend my strength to satisfy them; but when a friend asks for information on any subject, I meet it with pleasure, and I am now willing to spread all my views before thee for thy consideration; but I charge thee that thou adopt none of them as thy own, for if thou dost, thou wilt be a thief and a robber. But if through Divine favor they are opened to thee in the light of the gospel, they are thine, and thou art not beholden to me for them."

The above is, as near as I can remember, the substance of our conversation, but it is short of the life of the matter.

I. P.

In endeavoring to estimate the genuineness of our religious experiences, we should ever keep in mind that all those experiences which are wrought by the Spirit of God, and are genuine in their character, tend decidedly and uniformly to personal *humility*. "Blessed are the poor in spirit, for their's is the kingdom of heaven." How can it be otherwise? The tendency of all true religion is to make God everything, and ourselves comparatively nothing; to sink the creature, while it elevates and enthrones the Creator in the centre of the heart. "God resisteth the proud, but giveth grace unto the humble."

For Friends' Intelligencer.

HISTORICAL SKETCHES AND REFLECTIONS.

BY S. M. JANNEY.

No. 2.

It is observed by Josephus, in his Preface to the Antiquities of the Jews, that their "Legislator speaks some things wisely, but enigmatically, and others under a decent allegory, but still explains such things as required a direct explanation plainly and expressly." We find accordingly in the Scripture narrative, some passages evidently intended as allegories; and a much larger number which were recorded as historical facts, but are susceptible of being allegorized. An example of the first kind may be seen in the speech of Jotham to the men of Shechem, concerning "the trees that went forth to anoint a king over them;" but we have a still finer example in the 80th Psalm, where the

chosen people are represented under the figure of a vine brought out of Egypt. An instance of the second class is the account given by Moses of the two sons born to Abraham, one by a bondmaid, the other by a free woman, which undoubtedly was literally true; although the apostle Paul has drawn from it an instructive allegory of the two covenants. It is desirable to avoid on the one hand that rigid literalism, which, in reading the Scriptures, refuses to look beneath the surface, and on the other that speculative tendency which ignores or denies the facts of history. The journey of the Israelites from Egypt to Canaan, and the building of the temple by Solomon, have always been favorite subjects for allegory among religious writers, but it would surely be very absurd to affirm that the journey of the Israelites and the building of the temple were merely allegories and never had any existence in fact. In treating of the creation as recorded in the first chapter of Genesis, I endeavored to show that it was seen by the prophet in a supernatural vision as a reality, that had long before transpired; but in the second and third chapters of the same book some of the incidents related are evidently an allegorical representation of spiritual truths. The origin of evil has been, in all ages, a fruitful source of speculation, and appears to be a problem that cannot be solved by human reason without divine revelation.

It is said in relation to the work of creation that "God saw every thing that he had made, and behold it was very good." Whence then came the evil? Did it not spring from the abuse of man's free agency? In order that he might be a responsible being, and serve God, not from compulsion, but from love, he was endowed with the power of choosing between good and evil; and consequently he was liable to fall if he rejected the good and chose the evil.

We read that in the garden of Eden, (or Delight,) where man was placed, "out of the ground made the Lord to grow every tree that is pleasant to the sight and good for food, the tree of life also in the midst of the garden, and the tree of knowledge of good and evil." And the command was given to man, "Of every tree of the garden thou mayest freely eat; but of the tree of the knowledge of good and evil thou shalt not eat, for in the day thou eatest thereof thou shalt surely die." Through the subtlety of the serpent, one of those beasts *created good*, the woman was induced to believe that by eating of the forbidden fruit their eyes should be opened, and they should be as gods, knowing good and evil. She therefore partook of the fruit "and gave some to her husband and he did eat." Isaac Penington, in his "Catechism for the Simple-hearted," has thrown some light upon this allegorical narrative. In answer to the question, What is the forbidden fruit? he says,

"It is knowledge without life; knowledge in the earthly part; knowledge acquired from below, not given from above. This promiseth to make men as God, and to give them the ability of discerning and distinguishing between good and evil, which is God's peculiar property. Eating of this fruit undid Adam, undid the Gentiles, undid the Jews, undid the Christians; they all feeding on the tree of knowledge, and departing from the life in their several dispensations."

We may safely conclude that I. Penington did not intend to depreciate the value of knowledge, when applied to *its appropriate uses*; but to show, that a mere head religion, consisting of opinions or notions, derived from education or intellectual effort, will not sustain the spiritual life; nothing short of that "hidden manna" which the spirit of Christ imparts to the humble and obedient, can sustain the life of the soul. Turning away from this heavenly food, and feeding upon the tree of knowledge, Adam lost the sense of Divine life, and became "carnally minded, 'which is death,' for they that are living in [sensual] pleasures are dead while they live."

In the popular theology the mortality of the human family is generally attributed to the sin of Adam, but this conclusion is not warranted by the Scriptures, nor consistent with the analogy of animal life. All animals die, and even before the existence of man upon this globe myriads of animals had lived and died, as their fossil remains attest; and not only did they die, but many of them were armed with weapons for the destruction of others that served them for food. This fact, says an eminent geologist, "is altogether at variance with the preconceived opinions of those who hold that until man appeared in creation, and darkened its sympathetic face with the stain of moral guilt, the reign of violence and outrage did not begin, and that there was no death among the inferior creatures and no suffering." "Untold ages ere man had sinned or suffered, the animal creation exhibited exactly its present state of war; the strong armed with formidable weapons exquisitely constructed to kill, preyed upon the weak, and the weak, sheathed, many of them, in defensive armor equally admirable for its mechanism, and ever increasing and multiplying upon the earth, far beyond the requirement of the mere maintenance of their races, were enabled to escape as species the assaults of the tyrant tribes, and to exist unthinned for unreckoned ages."* This arrangement, by which some species of animals prey upon others, so far from marring the plan of creation, is an evidence of wisdom and design, for it enables a much larger number of animals to live upon the earth than

could otherwise find subsistence; it also thins out the prolific races, which, without this check, would become too numerous for the utmost supply of vegetable food, and would thus be exposed to protracted suffering.

In a state of nature, beasts of prey are the butchers which maintain a due proportion between the animal and vegetable kingdoms; but when man comes into dominion, he destroys the carnivorous animals which are no longer needed, and protects the graminivorous that supply him with food and clothing.

It appears then, that death is a law of the animal kingdom wisely adapted for a beneficent purpose; and there is no reason to suppose that the animal nature of man was ever intended to be exempt from it.

On the contrary, it was evidently the design of Infinite Wisdom that his rational creatures should by obedience to his laws, written in the heart, become sanctified and prepared to enter through the gates of death into the mansions of eternal bliss.

Another mistake of the popular theology is the supposition that guilt has been transmitted by inheritance from Adam. The Scriptures, when properly understood, afford no warrant for such a belief, nor is it consistent with the idea of just responsibility implanted in the human soul. The argument of Phipps, in his "Original and Present State of Man," appears conclusive on this head. "The soul of the child," he says, "never was in the parent, and therefore could never sin in him, nor derive guilt from his transgression. Neither can guilt accrue to it merely from its being joined to a body descended from him, because that junction is the act of the Creator."* This sentiment accords with the views of Robert Barclay. He denies that the guilt of Adam's sin lies at the door of infants who never actually sinned, and avers that "the natural death of the saints is not the wages of sin."† But the most conclusive denial of the doctrine of original sin is the divine declaration through the prophet Ezekiel. "The soul that sinneth it shall die, The son shall not bear the iniquity of the father, neither shall the father bear the iniquity of the son: The righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him?"

Although guilt cannot be transmitted as an inheritance, from father to son, it is held by physiologists that the animal propensities and mental qualities predominating in parents are generally transmitted to their descendants. Hereditary qualities and dispositions have been so generally observed, that it has passed into a proverb, "A chip of the old block." It seems to be a law of nature that the indulgence of sen-

* Testimony of the Rocks, p. 103.

* Page 10 to 13.

† Barclay's works, London, 1692, page 41 and 94.

suality and vice by any family for many successive generations, not only impairs the physical constitution, but degrades the intellectual faculties. In this respect the iniquities of the parents are visited upon the children, "to the third and fourth generations," and the evil is greatly augmented by the bad examples which such parents set before their offspring. How mournful it is to reflect upon the remarkable fact, that the first human being born of a woman, should have proved to be a murderer. Cain slew his brother, "because his own works were evil, and his brother's righteous."*

The penalty inflicted by the righteous judge for this wicked deed, has been recorded for the instruction of succeeding generations. It did not consist in torturing the body, nor in taking life for life; but it was the separation of the murderer from society, and placing upon him a mark of guilt. Cain went forth and dwelt in the land of Nod, which means Vagabond, and doubtless he took his wife with him.

His descendants followed the wicked example of their father, for in the brief record we have concerning them, both polygamy and murder are mentioned.

Cain was the first to build a city, which he named after his son Enoch; among whose descendants were Jubal, the inventor of musical instruments, and Tubal-Cain, "the Vulcan of old times."

"The first artificer of death; the shrewd
Contriver who first sweated at the forge,
And forced the blunt and yet unbloodied steel
To a keen edge, and made it bright for war."

The poet Montgomery has given in the following lines a picture of those primeval times, which is not inconsistent with the sacred record:

"Ages meanwhile, as ages now are told,
O'er the young world in long succession rolled;
For such the vigor of primeval man,
Through numbered centuries his period ran,
And the first parents saw their hardy race
O'er the green wilds of habitable space,
By tribes and kindred scattered wide and far
Beneath the track of every varying star.
But as they multiplied from clime to clime,
Emboldened by their elder brother's crime
They spurned obedience to the Patriarchs' yoke,
The bands of nature's fellowship they broke;
The weak became the victims of the strong,
And earth was filled with violence and wrong."

TANNER'S LECTURES.

(Continued from page 4.)

Friends in Somersetshire were involved in some difficulty in 1685, by the circumstances attendant on the Duke of Monmouth's rebellion. There were, indeed, more reasons than one why Friends were less likely than most others to be implicated in that movement. Their testimony against all wars and fightings, their steady loyalty, and the benefits which they had received

at the hands of James the Second, all conspired to prevent it. Macaulay, in writing of the first year of James' reign, says that the Quakers had, in spite of much ill usage, submitted themselves meekly to the royal authority: and that no Quaker had ever had a libel on the Government traced to him, or been implicated in any conspiracy against the Government. An instance of the loyalty manifested by Friends in early times, is mentioned by Thomas Garrard, in his "Life and times of Edward Colston." He mentions that on the occasion of the visit paid to Bristol by Charles the Second and his Queen, in 1663, the city treasury was empty; and that a number of the citizens consented to join in lending the amount necessary to provide for the royal visitors. Among others he mentions that "Thomas Speed and George Bishop, two highly respected members of the Society of Friends, presented, in the name of the Society, a loan of £100 for the purpose of augmenting the fund, 'that their Majesties might be entertained in a style and manner becoming their dignity, and the proverbial hospitality of the city, in its most palmy days.'"

In regard to the Duke of Monmouth's position, Friends of Somersetshire were early on their guard. John Whiting, who was a prisoner at Ilchester in 1680, writes as follows:—"In the sixth month of this year came down the Duke of Monmouth, in his progress in the west, and came through Ilchester with some thousands on horseback attending him; the country flocking to him and after him; the eyes of the nation being upon him and towards him, as the hopes and head of the Protestant interest at that time, in opposition to the Duke of York and Popish party; so that the affections of the people run exceedingly after him. We stood in the Friary-gate as he rode through the town; and as he passed by, taking notice of so many Quakers together with their hats on, he stopped and put off his to us; and one Friend, John Anderdon had a mind to speak to him, and tell him that *we were prisoners for conscience-sake*, but had a stop in his mind, lest there should be an ill use made of it, in applying to him and making him too popular: the Court having a watchful eye over him. However we could not but have a respect to him for his affability, and therefore were the more concerned for him when his fall came."†

Notwithstanding the caution observed by

*Page 241, Garrard states that Sir John Knight received his title on that occasion, and that shortly afterwards he sent both Thomas Speed and Georg Bishop to prison. Thomas Speed was a member of the Town Council, as appears from the following extract from the city records, given me by Francis Fry:—"At a General Sealing 28th September, 1685, was sealed a discharge to Mr. Thomas Speed, from the Common Council and other offices."

† Memoirs, p 65.

* 1 John iii. 12.

Friends in regard to the Duke's proceedings, and their well-known loyalty and peaceableness, unfavorable reports were put in circulation, and some of these having reached Whitehall, and become known to Friends in London, they addressed a letter of inquiry to the Ilchester prisoners, who seem to have acted the part of a standing committee on behalf of Friends of Somersetshire. Their reply, signed by Jasper Batt and others, is dated the first of sixth month, 1685. It speaks in decided terms of the general clearness of Friends from any participation in the Duke's insurrection, and mentions the circumstance of one of his officers having come to Ilchester "and released several prisoners that were detained on his account, and the Quakers also," and "strictly charged the keeper no more to detain them, and highly threatened him if he did. But the so-called Quakers took no advantage of that liberty, but continued prisoners as formerly." It is remarked that some Friends had rendered themselves liable to suspicion, by their having followed the army to look after the horses and oxen which had been taken from them by the Duke's soldiers, and that other Friends in travelling to their markets, &c., had encountered detachments of the army. Several cases are mentioned of persons joining the Duke's forces who had at one time been known as Friends, but who had sometime before been disowned on account of their intemperance or dishonesty. And there is an allusion made to one or two persons still known as Friends, who had been more or less compromised by their proceedings in connection with the late rebellion.

Another document was prepared by Friends of the counties of Somerset, Devon, and Dorset, for presentation to the Government, disclaiming all approval of the late insurrection, or participation in it. They speak of a public meeting of Friends, held near Taunton* the same day on which the Duke marched thither, in which it was "testified by the said people, that whatever our sufferings were we must not expect deliverance by the arm of flesh, but look unto the Lord from whom our salvation comes, and who will not save us by sword nor spear, but by his own Spirit. And therefore our Friends were warned not to concern themselves in war, (and) all unanimously consented thereunto." This paper concludes with an expression of Friends' resolution to persevere in their peaceable principle and profession, "through the assistance [they say] of our God, while we have a being in these earthly tabernacles, in the full assurance that when the testimony is finished, and this mortal life ended, we shall have a dwelling place in the kingdom of glory, which Christ Jesus hath prepared for us, and purchased us unto his own blood, by whom only we expect to

enjoy the same, when we shall rest from our labors and sufferings, and give glory to our God and His Lamb, who is worthy of honor and dominion for ever.—Amen." This "testimony" was sent to the Meeting for Sufferings, together with a number of certificates, granted to Friends by the churchwardens and others in different parishes in which they resided, setting forth their clearness of participation in the late insurrection.* A letter from George Whitehead, dated London, the twenty-second of the sixth month, 1685, acknowledges the receipt of these documents, and intimates that they will shortly be laid before the King. He mentions that the unfavorable impression which the Court had received was wearing off, but recommends Friends to clear themselves as far as they can to the magistrates in their respective neighborhoods, and at the same time to be careful not to charge particular persons by name, as having taken part in rebellion, "though they be apostates."

Three cases are recorded by the Somersetshire Meetings, of persons connected with the Society who had taken more or less part in the rebellion. A graphic account is given by John Whiting,† of his going to Taunton, whilst the Duke was there, to endeavor to induce one of these persons, Francis Scott, who had followed the army in the hope of selling some horses, to return home. Another case, which attracted still more attention, was that of Thomas Plaice, of Edington, against whom a testimony was issued by the Quarterly Meeting of Somerset, in the seventh month, 1685.‡ It states, that "whereas the said Thomas Plaice did appear very active and conversant in the late Duke of Monmouth's army, &c., though not in arms. Now, in consideration thereof, we do on behalf of the people called 'Quakers,' testify and declare that we utterly disown the aforesaid practices of the said Thomas Plaice, and that he is greatly revolted and backslidden from and turned out of the way, which the said people still own and walk in," &c. This document concludes as follows, "And for any others that have formerly made a profession of truth, our principle and way as afore declared, and have taken up arms, or assisted with horse, money, or ammunition in the late war, we do testify that therein they are turned from the said way and principle, and are disowned by us; are gone from our Christian Society, and cannot again be owned by us; but as the Lord may give them time and space of repentance, and they repent accordingly." The case of Francis Scott was dealt with by the West, and a third, that of J. Hellier, of Mark, by the Middle Division Monthly Meeting. None of these parties fell into the hands of Judge Jefferies, the selection

*Copies of these certificates are preserved among James Dix's MSS.

†'Memoirs of J. W.' &c.

*This was probably the Quarterly Meeting at Gregory Stoke, mentioned by J. Whiting, p. 226.

of whose victims seems to have been a very random one.

Almost the whole of Somersetshire was implicated in these sad transactions, and many traditions of the brutal executions which followed the "bloody Assizes," still exist in that country. One of these, often mentioned by the late Mary Follet, of South Brent, referred to an ancestor of her own (not a Friend) who resided at Bridgewater. He and others secreted themselves for some time in a cave, where his wife and child* were in the habit of visiting him by night. Their place of concealment being discovered, they were apprehended and executed. The selection of the two hundred and thirty nine prisoners whom Jefferies left for execution, was made from thirty-six different places in Somersetshire.

The relief from severe persecution which had been granted to Friends through the dispensing power exercised by James the Second, was secured to them in a more satisfactory and constitutional manner, on the accession of William and Mary, by the passing of the Toleration Act, and other measures of a like kind. The principal remaining cause of grievance was the ruinous processes to which they were subjected for the recovery of ecclesiastical demands, and in connexion with which a number of cases of severe imprisonment occurred in the early part of the last century.

To be continued.

For Friends' Intelligencer.

A WORD OF CAUTION.

Having frequently observed, in social circles where my lot has been cast, a practice of calling up and scrutinizing the conduct of neighbors and acquaintances, whether fellow members in religious association or not, and passing judgment upon such conduct without investigation, and too often accusing them of wrong motives, and well knowing from experience, the deleterious results to the mind thus engaged, I have felt drawn to communicate a few words of caution to some through the columns of the *Intelligencer*.

When we consider that the religion of Christ, in which we profess to have a belief, and to which we are concerned to bear a testimony, is a religion of love, that it leads its votaries to depend upon and be obedient to the direction of the Heavenly Monitor within, and hence to lay down everything of a selfish nature and bring them into that state in which they desire to promote "Peace on earth and good will among men," we must at once discover, that anything that has a tendency to delight in commenting upon the frailties and missteps of others, is antagonistic to this pure principle and hence fraught with evil to the mind that indulges in it, as well as to those against whom it is indulged.

When we reflect that we too have our weak points, and are not always on our guard, or that we may be misunderstood or our motives misconstrued, and hence afford opportunities for those who indulge in this faultfinding spirit to call in question our actions, and the purity of our intentions, we shall find that there is a necessity for the exercise of that charity without which our faith and hope are vain, and this will induce us to keep a watchful guard over the working of the natural propensities under the direction and by the aid of Divine power and wisdom.

Having undergone much suffering in consequence of giving way to this habit, I have been much pained to hear remarks made in social circles where I have mingled with Friends, and made, too, by some who are professing to stand as Christ's ambassadors to the people—remarks which have evidently tended to show the darker view of the actions and motives of men, and consequently, though perhaps not intentionally, have exerted an influence detrimental to the individuals whose conduct has been called in question.

I feel that in writing these hints there is need of being charitable towards such as are addicted to this practice, for I well know how ready the tempter is to present himself at our most vulnerable points, and that when we think them the most securely guarded, there is the greater need of watchfulness, because I find that when mingling with such, a constant temptation is presented to join with them and too frequently have cause to sorrow in consequence of not being sufficiently careful. If we suffer this habit to grow upon us, it will not only prove a present injury, but as age advances, instead of securing the affection of our fellow-men we shall repel it, and instead of progressing, we shall become dwarfed in religious growth.

Then to all who may peruse this, I feel to hold out the invitation to come with me, and endeavor more closely to examine our words and actions, to ascertain what spirit we are evincing in our social intercourse, and to set a double guard over our words and thoughts; then, by the aid of the light of truth which will be afforded us for this examination if we seek for it patiently and with full purpose of heart, I think we shall discover some of the "little foxes that spoil the tender vines," some of the little hinderances which are preventing our growth in the knowledge of Divine things; and as the truth dawns upon our minds, and we see where we are, let us be engaged to put up our petitions to our Heavenly Father to create in us a clean heart, and give us strength to keep our covenants with Him, that we may fulfill the design for which we were created, and in the end receive the "crown immortal."

JOHN J. CORNELL.

THE RIGHT COURSE.—In things of every kind, earthly as well as spiritual, "Godly simplicity and integrity" is the only right course; and, whatever it may cost, it will bring happiness in the end.

FRIENDS' INTELLIGENCER.

PHILADELPHIA; THIRD MONTH 26, 1859.

We have received from Dr. T. S. Kirkbride the eighteenth annual report of the Pennsylvania Hospital for the Insane.

On the first of the present year there were 115 male and 115 female patients under treatment.

The crowded state of the wards make it necessary to reject many applications for admission, while it is calculated to lessen the number of recoveries. It is stated that \$50,000 will be required to finish the new building, and procure the necessary furniture, and it is hoped this sum will be raised by subscription, and that the house will be opened before the close of the present year.

In alluding to the importance of a correct public sentiment on the subject of Insanity. Dr. Kirkbride makes these excellent remarks:

"One of the first steps in the right direction is the general conviction that insanity is a functional disease of the brain, just as dyspepsia may be a functional disease of the stomach—that every individual that has a brain, at some period of life, and under some circumstances, often beyond his control, may have functional disturbance of that brain, just as much as he that has a stomach may suffer from some of the Protean forms of derangement of that organ. This is the first great step that costs us something of our pride of intellect. We are too apt to look back at the history of our ancestors, and if we find, as we suppose, no weak points in that direction, to regard ourselves as enjoying a degree of security that may not be real. It is a very common subject for remark about hospitals for the insane, how frequently visitors to these institutions, who have paid little attention to the subject, speak as though they were making their observations in reference to a form of disease entirely beyond the accidents of their lives, or a condition of humanity that by no possibility might be their own. Hereditary influences, striking as these often are, really exist but in a very small proportion of all the cases, and even where they do, an individual who is strictly mindful of natural laws, avoids excesses of all kinds, and is happy in his domestic and social relations, may be really much better off than those who lead a different kind of life, and yet have never known an ances-

tor to suffer from such an affliction. No year passes in any large community, without a development of this disease, in some one in whom it had never been anticipated, whose friends are sure to exclaim, on its occurrence, "How strange! Of that whole family, or of all our acquaintances, this was the very last, we should have supposed, would ever have been thus afflicted!"

It does not require a very extended familiarity with the subjects of this malady to know that it is found among the purest and the best of all the dwellers upon earth, as well as those who are far from being models of excellence; that it is seen in early childhood, and is developed after the threescore and ten years allotted to man; that it comes with the gentleness and loveliness of woman, no less than with the strength and self-reliance of the most vigorous manhood; that high social position, exalted intellectual endowment, the most abundant wealth, and all the surroundings that are supposed to make life desirable, cannot be relied upon as a guarantee against mental more than against ordinary physical infirmity. The one is often the precursor and the cause of the other, and it is just as rational to believe that an individual has an exemption from the one, as from the other.

No one will deny that ordinarily mental disease is much more to be dreaded than that which is simply physical, for the attributes of the mind are much more exalted and more to be valued than those of the body; and yet a temporary attack of insanity, likely to result in health, is less of an affliction, involves less loss to an individual, his family and society, than many other maladies, which, although they may not be attended with mental disturbance, still pass on surely and steadily, with great suffering, to death.

The curability of insanity in a large proportion of the cases, if subjected to proper treatment at an early period of the disease, is now so well established as to require little to be said on the subject. Thus treated, the ratio of recoveries is greater than in many other diseases of more common occurrence. The number of individuals who have been under my own care, or whose history is familiar to me, who, after a recovery, have returned to their homes as heads of families, or have assumed every duty of life, who have afterwards, during a long period, occupied positions of high public trust and great responsibility, have conducted commercial business of the most extended kind, or passed through trials of a nature to test the integrity of the best disciplined minds, and have yet come out from all without the slightest indication of a relapse, is now so large as to give a degree of confidence for the future of those who have been restored and exercise ordinary prudence, that could not otherwise be attained.

The nomenclature formerly applied to insanity,

and to establishments for its treatment, and unfortunately not yet entirely given up, is far behind the age, and has done more harm in influencing men's minds in reference to both, than is generally supposed. In the days when cells and keepers were spoken of, the natural inference was that they belonged to prisons, for these are prison terms. Even now, it occasionally happens that such terms are heard from individuals who, themselves, often occupy smaller apartments, more inconveniently located, more poorly warmed, ventilated and lighted, and not better furnished, and yet who would seem greatly surprised if asked whether they had comfortable 'cells,' in the fourth or fifth story of their hotel or boarding-house. There is no reason for thus designating the better of the two chambers, that would not apply to the poorer of the two, nor should a nurse and companion of an insane person be styled a keeper any more than if having the care of a case of ordinary sickness. So of the institutions themselves; if they are for the treatment of disease, they should be called hospitals—a title which is not likely to be mistaken, and which of itself indicates why patients are sent to them. All the other names which originated many years ago, and were intended to banish what was much more exceptionable, came from the best of motives, but were unfortunate as tending to give wrong impressions of the character of the malady. None of those who are now connected with these institutions, probably, have had anything to do with naming them, nor are they in any way responsible for these errors. This institution having at its commencement been as far wrong in reference to a title as any other, and having made the change, I have no hesitation in speaking of the good results which have followed. The early drawings for this building will show that it was first styled the 'Lunatic Asylum of the Pennsylvania Hospital,' but before it was opened, the name was very properly changed to that which it now has, 'the Pennsylvania Hospital for the Insane.'

The abandonment of these objectionable terms by all connected with our hospitals for the Insane, would soon lead to their being dropped in ordinary conversation, and in a little time a more appropriate nomenclature could hardly fail to take their place.

Another error—formerly very prevalent, and although now discarded by the most intelligent portion of the community, is still occasionally alluded to—is that of regarding insanity itself, or the residence of an individual in an institution for its treatment, as a reproach, or as destructive of future prosperity in life. The accident of having an attack of disease, to which all are liable, and especially if without any direct agency of our own, or certainly without anything on our part that was dishonorable or criminal, can be no reproach to any one. A sensible man, when

sick, will adopt such means for the restoration of his health as the experience and advice of honest and intelligent men give him reason to suppose will be most likely to effect that object; and if that end will probably be soonest and most certainly attained by entering a hospital, it would clearly be an imputation upon the sound judgment of himself and his friends, if he did not promptly avail himself of any advantages it might afford.

MARRIED, On the 3d inst., WILLIAM M. SANFORD, of New York, to PHEBE H. LAING, daughter of Isaac Laing, of Plainfield, Union Co., N. J.

—, On the 28th of 12th mo., 1858, at the residence of James Norton, of Wells, Rutland co., Vt., MARCUS B. ALLEN, of Granville, N. Y., to HANNAH B. NORTON, of the former place.

DIED, at her residence near Gettysbury, Adams Co., Pa., on 21st of 10th month, 1858, MARGARET WALKER, relict of the late Abel Walker, in the 66th year of her age, a member of Monalen Monthly Meeting.

For Friends' Intelligencer.

THE AFRICAN SLAVE TRADE.

In this day of boasted moral and intellectual enlightenment, it would seem incredible were it not for continual proof to the contrary, that any confederacy of men should give encouragement to this iniquitous traffic. From the accounts that are continually before us, this trade has in no respects changed its character, except, perhaps, by an increase of atrocities, and yet a bill has been introduced into one of our Southern States, Louisiana, authorizing the purchase of "negro slaves from Cuba, Brazil and Africa, and to bring said slaves into this State, &c."—thus legalizing this inhuman traffic with all its concomitant cruelties. When we consider the immense pecuniary results attendant upon this species of commerce, it is not surprising that unprincipled persons should be tempted to engage in it; but sorrowful, indeed, is it when those to whom the nation's welfare is entrusted—the rulers and law makers in the land—allow their better judgment to be so swayed by selfish interest, that in defiance of every principle of justice, and the claim of our common brotherhood, they persist in passing enactments making a covert wrong a lawful right, thus perpetuating and extending the great curse, American Slavery.

The horrors and enormity of this traffic were fearfully exhibited in the condition and appearance of the Africans on board the brig Echo, who were sent to Liberia by order of the United States Government; and yet this is only one instance of the many which might be adduced in proof of the great sufferings and privations to which they are exposed on the middle passage. The vessels are mostly scantily provisioned, and poorly furnished with water, so that the negroes are often forced to drink the sea water. To prevent

mutiny among them, the cargoes are selected from different tribes, with every variety of feature and character; and speaking different languages, they are unable to enter into any combination for revolt or resistance. In the Colonization Herald, the Echo "is described as a brig of about 280 tons, very heavily sparred, and as rakishly rigged as a clipper. In this craft there were taken aboard 455 Africans when she sailed, forty-five days prior to her capture on the 21st September. The cargo was gathered up in Cabenda, near the Congo river, about 6 degrees south. They were nearly all youths, averaging from 15 to 20 years, though some of them are children of nine or ten years, and hardly one above twenty-five years old. There were but two infants among them, though it was evident that of the forty females surviving, most of them had been mothers. When captured, the brig had 316 Africans alive, and on her voyage to Charleston 10 died, and soon after several more died, making a mortality of one third of the whole in a little over fifty days. The males, who are the great majority, had been confined in the middle passage, a space 55 feet long, 19 feet wide in the broadest part, and 44 inches between decks. The hold had no ventilation except the hatchway in the middle of the deck. "If the hatch should be shut down, there would not be a particle of light, as there was not a single bull's eye even, or the smallest port hole, for light or air."

When all were prepared for sleep, they were ranged in two rows extending from the quarter to the forward hatch, and the whole crowd of two hundred and fifty males were "spooned" together lying on one side, and packed together as closely as herrings in a barrel. The females had a place by themselves in the hold below, and on the quarter deck above. They had to be thus crowded, in the first instance, when sleeping in the hold below; and the same position would be required on deck, instead of standing, in order to be out of reach of the glasses of the cruisers, and to escape an occasional round shot which a pursuer might send through the rigging. In sitting, some had their legs stretched out straight, but most of them with their legs doubled up in front.

Thirty-two of these people died in Charleston, and seventy on board of the Niagara during her voyage to Monrovia. Thus, 255, or considerably more than half of the Echo's cargo, have died previous to their being landed in Liberia. "A more hideous spectacle," says Dr. Rainey, who accompanied them to Liberia as the special agent of the government, "than they presented, could not be well imagined. A graveyard could not muster a more ghostly army of hobgoblins. Long confinement, bad air, herding like swine, and crouching under a low slave deck not above four feet high, in addition to salt food very de-

ficient in quantity, want of exercise, and cruel treatment generally, had wrought upon them most disastrously." And he adds: "I trust that I shall never again witness such scenes of suffering as we found among these people for forty-eight days. The heartlessness and cruelty of a system resulting in so many slow and torturing deaths, must be palpable to every properly constituted mind and heart, and cannot fail to enlist a corrective sympathy, unless men are holy hardened to vice and lost to the shame of crime." H.

For Friends' Intelligencer.

A VISION.

I have heard the awful thunders roll and saw the vivid lightnings glare, and the blackness of the lowering sky was awfully sublime, and fearful forebodings presented themselves of the approaching storm. Whilst I mused the impressions were, keep still, venture not, lest thou art thyself engulfed in the ruins. Watch and be instructed. And in the confusion of the elements I beheld the leaves wrested from their stems, the grass and every green thing torn up by the roots, the lofty pines reeled, the sturdy oaks wrested from their foundations, and every object seemed to vibrate in the whirlwind, until I was ready to cry, alas! for our poor Society; there is nothing but sure destruction awaits her on every hand, for she is the sport of the elements and there is none to save her. And as I became deeply concerned on her account, I saw the abomination of desolation that covered the earth. The elements of war, slavery, intemperance, drunkenness, and every other evil appeared full in view, and the voice said, cry aloud and spare not, lift up thy voice as a trumpet, and sound the alarm to the people. I began to cry, death took hold of me, confusion appeared in every word, insomuch that I retired in secret to enquire how can this be. Did I not hear thy voice bid me cry? The answer was, but it was thy place to have waited to have known what to cry; for herein my servants err. This is the offering of false fire that brings nothing but blackness and death in its train. They forget the cause is mine, and that I alone can qualify aright. They forget that their rational faculties, the only intelligent recipients of my truths, are void unless illuminated by my spirit, and thereby fail to be instructed. For I will have a pure offering, undefiled in my sight. But as the horse, restless for the charge, and without the direction of his rider, rushes to certain destruction, so do my servants often lay waste the cause for which they feel so much, and they lay the blame to their opponents. For the rational faculties, with all their embellishments and alluring qualities, are but rational still; but when shone upon and illuminated by my spirit, then it is that they

shine with radiant splendour, and their light diffuses warmth and invigorating beauty to every thing around them.

Again I saw those whose age and experience and long tried services, whose principles had become fixed, and the powers of tradition had riveted her chains strong and indissoluble; yet, nevertheless, their honesty of purpose and purity of motives had always procured for them an acceptance of their offering. These became alarmed, and trembled at every thing that appeared new, and through their over zealous watchfulness often retarded the onward march of improvement by trusting in former experience, and a reliance on their own strength. And thus I saw the combined efforts of the young and rising experience at war with the experience of age.

And the whirlwind of those elements came very near rooting up every thing green and lovely in our Society. And as my mind became depressed and cast down, and ready to cry who shall deliver us, I looked and behold the storm had passed away, the sun rose with its wonted splendour and radiant beauty, the herbage again put forth its tender shoot, the dew of the morning rested on the leaves, and all the loveliness of spring appeared to comfort the laborer, and cheer him on his way.

Then I saw the promise fulfilled, that though heaven and earth may pass away, yet my promise of summer and winter, seed time and harvest, shall never cease to be in their turn.

A. V.

Erie Co., N. Y., 3d mo. 9th, 1859.

THE HEAVENS ARE TELLING.

It is the decree of nature, and we cannot help it if we would, that the grandest exhibitions of the celestial phenomena shall occur in winter. The summer evening skies are always beautiful, but the spectacle then presented is inferior, in the magnitude and splendor of the heavenly orbs, to that which glitters on a winter night. They are not only then really larger, that is, in appearance, but the medium is generally more pure and favorable for the transmission of their rays at that season, than in the soft, vapory atmosphere of the warm months. We cannot help it, as we have said, but we have frequently regretted that the most magnificent aspects of the heavens should pass away almost unobserved, while people are compelled to sit by their fires well housed, instead of yielding to the temptation of gazing on them as they are passing. When the spring opens, and people can look at them without freezing, they are gone, not to return till another year shall roll them back, bringing with it the very same splendors and the same incapacity to enjoy them as before.

Very few stars of the first magnitude are visible

in a July evening. When the golden Arcturus, the silver Vega, otherwise called Lyra, the ruby Antares, and Altair are mentioned, the whole list of them will be given. Many fine stars of the second magnitude, indeed, some of which are scarcely less brilliant than the first, may be seen. Among these are Spica in *Virgo*, Denebola and Regulus in *Leo*, Benetnasch in *Ursa Major*, beside other bright orbs of less size. Now and then a wandering star or two, as the planets Mars and Saturn in their respectively brief or protracted revolutions, and those gems of the blue concave—the white-orbed Jupiter and golden haired Venus—arrest the notice of men, whose eyes are habitually turned downward, as if to admire the works of their own ingenuity. We must not omit to make due acknowledgments to the Moon, who is by far the most regular as well as beautiful visitor of the evening sky among all the heavenly bodies.

At long intervals, comets worthy of the name visit us, like our last year's welcome guest, which has left a name of good odor behind it, and has been universally invited to call again at an early day, or evening rather. But these characters are exceedingly eccentric, as they who have uncommon ability to please are apt to be, and are not to be depended upon at all. We have not heard how many years or centuries are to roll away previous to its reappearance to mingle with the years before the Flood, but we imagine it will be entirely imprudent for any of us to sit up o' nights to witness and hail its return.

These revolving planets, however,—this superb moon, and these erratic comets are not limited to the warm season for their visitations, but come to us in the winter as well. And what glorious stars, which have received the name of "fixed," are regularly and annually assembled at this time to delight and astonish all beholders, but most of all the "upright heart and pure," and those who reflect the most. Just take your stand, if the unfriendly frost will permit, upon a spot where the sublime, celestial arch can be comprehended at one glance. Turn your back, at about nine o'clock in the evening, to the North Star, that glimmers half way up from the horizon to the zenith, and there before you in the south flames the transcendent constellation of *Orion*, with its seven large stars, two of them of the first magnitude, and three others constituting his *Belt*. Close by, on the right, is another star of the first magnitude called Aldeboran, next the *Hyades*, then a little further on the universally recognized *Pleiades*; the last are in the constellation *Taurus*. When to this group of distant suns the planet Jupiter is added, with the crescent moon not far off to the west, it may be affirmed that no equal display of wonderful beauty and sublimity is open anywhere else to mortal eyes.

Far down in the South a dull red star of the

first magnitude called *Fomalhaut* is setting, and a little to the left of it you will see some bright stars in the Whale. Andromeda, with her large stars, Alpherat, Merac and Almaach, may be seen over your right shoulder toward the North-west. Behind you on the North is *Capella*, one of the largest and fairest of the heavenly host, together with two others near it, of the second magnitude, all in the constellation of *Auriga*. To the East of Orion, at the same elevation, is Procyon, of the first magnitude in *Canis Minor*, and North of it twenty-five degrees, are the Twins Castor and Pollux, or the constellation *Gemini*.

But the transcendent fixed star of the whole heavens, either in this or the southern hemisphere, is Sirius in *Canis Major*, which is to be seen flashing in the southeast, lower down than Procyon. It cannot be mistaken by the most indifferent or stupid observer of the heavens. Such are some of the wonderful masses of light and matter which confront us at this particular time. Next month will bring changes. Stars will then have set at the same hour of nine and others will have risen; but at no period perhaps will so gorgeous a spectacle be presented to the eye of man as at this time. No other sight can match it, far surpassing any view of earth or ocean, or of man's device. Thousands of worlds are visible at one glance of the eye, many larger than our own, and all at incalculable distances removed! No one could behold them for the first time without an exclamation of astonishment, or else without silent stupefaction. Who of us, that have seen them often, can look upon them while alone, withdrawn from men, and not be still struck with admiration, mingled with awe? The heavens are sublime, are in the most rapid motion, and are silent, yet they are "declaring the glory of God, and the firmament showeth his handy work." "They shall perish, but thou, God, shalt endure; yea, all of them wax old like a garment; as a vesture shalt thou change them, and they shall be changed. But thou art the same, and thy years shall have no end." "The heavens are telling" indeed, but few listen.

Newark Daily Advertiser.

LINES WRITTEN UPON THE DISAPPOINTMENT OF A CHERISHED HOPE.

TO MY HUSBAND.

Keep up thy spirits, dearest,
Nor heed a gloomy day,
For clouds that are the nearest
Will soonest pass away—

There's balm for every sorrow,
There's comfort still for care,
And hope will rise to-morrow,
To chase to-day's despair—

Did fortunes's gift surround us,
We well might dread a change,
When no such limits bound us,
Hope has a wider range.

And though no place of rest, love,
Has to her lot been cast—
She'll yet find some snug nest, love,
To guide us to at last.

A COMMON FAILING.

There is a fault that leads to sorrow,
As surely as more glaring sin,
The too great aptitude to borrow
From some infirmity within,
A telescope through which to scan
The actions of a brother man;

To magnify each written line,
Or unpremeditated word;
And oftentimes to intertwine
Conclusions not to be inferred
From words or paragraphs whose strain
Was not designed to give us pain.

The sweetest nectarine contains
A deadly poison of its own,
But this fell property remains
Concealed innocuous in the stone,
Until the learned chemist's skill
Has vivified the power to kill.

A felon bee of eastern clime,
So poets tell the story sad,
Draws from the sweet bloom of the thyme,
A venom forth that drives men mad,
Neglecting all the sweets, or worse,
Making them yield a deadly cure.

But think not that a poison lurks
Deep hidden in a brother's words;
Read his true nature in his works;
Our brief existence ill affords
The time to seek supposed intent,
To hunt for what was never meant.

Better by far to suffer blindness,
The stolid blindness of the mind,
Than to search through a life of kindness
For some faint trace of aught unkind,
And seek by skill to bring to light
That which before was out of sight.

Man should not exercise the power,
Possessed by his too subtle mind,
To find the bitter and the sour,
Where all around is sweet and kind;
Thus by alembic of the soul
Distilling drops of venom foul.

Ah no! the bright ingenuous mind,
Strong in unflinching rectitude,
Is never hastily inclined

To think injurious or rude
That which would read amiss alone
By misconstruction of its own.

Oh Charity! thou hast a charm,
Superior to all our skill;
Thou canst the injurious thought disarm,
Deprive it of the power to kill;
Thou seest all things for the best!
Believest all things to be blessed.

Oh! glorious Charity! the man
Whose peaceful heart is filled with thee,
Is armed throughout life's little span,
Against this failing perfectly.
Well may he hope for Heaven above,
Whose soul, on earth, is full of love.*

EDWARD NEWMAN.

* The word *caritus*, translated *charity*, signifies the pure catholic love of mankind.

BARCLAY'S SUBTERRANEAN JERUSALEM.

(Continued from page 6.)

More, however, of these Cyclopean masses are still extant, fixed and visible in their ancient places, than meet the eye of the surface explorer of the city. They are found now where they stood originally, built into those vast and huge sub-structures under the south-east corner of the Haram enclosure; and again, further westward, under the mosque El Aksa. Here, in the opposite extremity of the same (the eastern) side of the city, another portion of the nether Jerusalem is opened; and, though portions of it has been visited before, by Catherwood and others, Dr. Barclay is the first who has enjoyed an opportunity for that leisurely survey and inquiry, which was needful to make his "views" of such a place perfectly reliable. Under the circumstances of his admission within the sacred precincts, he was enabled to examine these under-halls and galleries most minutely; and he has so detailed and pictured the results of his investigation, that this portion of the ancient city may in truth be *seen* by a reader of his volume. Here we have authentic specimens, especially in the lofty pillars which support the arched roofs of the largest of these halls, of the style and massiveness of those erections, for which the Bezethan quarry furnished the materials. These halls extend over more than an acre of ground; the pillars that support the roof are, including those built into the walls, more than 100 in number, and some are thirty-five feet high. But of the walls that close them to the west and north, some are evidently modern; and, as we have been told, they betray, when struck, the existence of spaces unoccupied that lie beyond them. What wonders lie concealed there, we know not, nor does any one now living, since even the guardians of the mosque are not aware of their existence. Further to the west are the vaults beneath El Aska; which are, however, far less spacious, their area not much exceeding a quarter of an acre. Moreover, in them the characteristic masonry of the Jewish era is more freely mixed with shafts and capitals of later date. But here, again, there are indications of vacant spaces, that have, in comparatively modern times, been walled up; the hollow echoes that answer, at so many points, to blows upon the sides of these long galleries, here, likewise, give forth that utterance which sounds like an expostulation with the nations of Christendom for their apathy in neglecting mines of knowledge, with which, probably, the treasured excavations of Nineveh and Egypt will hardly bear comparison.

But we must now pass on to the remarkable spaces and passages, far beneath the surface of the present city, which have been explored in consequence of suggestions respecting the water supply of Jerusalem in ancient times. It has often been remarked that, in the many sieges to

which the inhabitants have been subjected, they have hardly ever—once, only, we believe—been described as suffering from thirst. Deep-seated aqueducts, so far below the surface, and running in such directions as to escape the search of besiegers, and subterranean reservoirs, with fountains also of "living water," have consequently been looked for, in explanation of this fact. These researches have resulted in two great discoveries, which have further enlarged our acquaintance with the subterranean regions of the ancient city. Of these, the first is wholly due to Dr. Barclay, and is best related in his own words:

"During our exploration of the Haram enclosure we observed, on removing a half-buried marble capital on one occasion, a rude subterranean passage leading to a long flight of steps. The Effendi immediately dispatched some of the workmen for flambeaux, and prepared for a thorough exploration. Descending a broad flight of forty-four wide steps cut in the native rock—but so worn in some places as to have required partial re-cutting, a few centuries ago, to all appearance,—we reached a beautiful sheet of water. The Effendi mounted the shoulders of a Fellah, and seemed to navigate the waters very pleasantly; while my sons and self spent our time, certainly as pleasantly, in wading through its rude but venerable halls, and making an accurate ground plan of it.

We afterwards spent a good portion of another day in its dark nether regions, completing and verifying the plan, taking other measurements, and making an accurate sketch, that are here figured, (in the book,) a few minutes' inspection of which will convey a better idea of this long-lost place than many pages of written explanation. . . . This sheet of water is, without doubt, 'the sea' of which the son of Sirach and the Commissioner of King Ptolemy speak in such rapturous terms. (Eccles. i. 3.) It is now, however, quite a rude piece of work—the massive metal-covered pillars have given place to ill-shaped piers, apparently of unhewn rocks, badly plastered; the rapacity of some of the various spoilers of the devoted city . . . having left it minus the lead or brass with which it was formerly encased. It is seven hundred and thirty-six feet in circuit, and forty-two in depth; and, according to the best estimate I could make, its capacity falls but little short of two millions of gallons. . . We discovered no fountain in connection with it, nor did we find the entrance of the aqueduct from Solomon's Pools, which we were told by one of the old keepers, who had formerly visited this subterranean lake, enters it on the west. . . It formerly had eight apertures above, through which the water was drawn up; but only one remains open at this time." (pp. 525-527.)

The other discovery we have alluded to was effected by the cool intrepidity of Mr. Walcott, an American missionary, in the year 1842. Ru-

mors having reached him of passages opening out from the bottom of a well, just outside the western wall of the Haram, he determined to descend and investigate them. Having been lowered down eighty feet by some of the Fellahs,—“who would, without doubt, have let the rope slip and left their employer to his fate on the slightest alarm,”—he found himself opposite a vaulted room, eighteen feet long and fourteen feet wide. Eleven feet further down, he came to “a passage . . . varying in width from one and a half to several feet, which leads from the south side of the well, and is, for fifteen or twenty feet arched over with rocks, the arches being of very good workmanship.” This passage extends for about one hundred feet to a reservoir, which, as far as can be judged, is twenty feet long, at the further end of which the ceiling declines, until it comes in contact with the water, and closes in the prospect. Mr. Walcott’s compass having been broken in his adventurous descent, the bearings of the room, and of the passage below it, could only be conjectured by him. Dr. Barclay, however, who was the next to investigate the place minutely, indeed the only other person who has done so, found that the room lies due north, and that the long passage, which he also was unable to trace further than Mr. Walcott had done, on account of the same cause, bears S. S. E. This excavation, consequently, is independent of those which are conjectured to lie still unknown under the Haram enclosure. Both the room and the passage, he says, have been repaired with fragments of marble columns, “the profuse use of which for such common purposes indicates that part of this structure was subsequent to one of Jerusalem’s sad overthrows—perhaps after the return from Babylon.” Here, then, we have, in another direction, ninety feet below the surface, large spaces of the neiter Jerusalem accessible—spaces conserved, unthought of, for generations, where no one has had opportunity or motive to revise the expressions of themselves which have been given by those men whose mind and character and whose thoughts we desire to know, that, by means thereof, we may gain a deeper insight into far more important knowledge.

AFRICAN FREE-LABOR COTTON.

A few days ago, Consul Campbell addressed us saying:—

“African cotton is no myth. A vessel has just arrived from Lagos with 607 bales on board, *on native account*. Several hundred bales more have been previously shipped this year.”

In order to afford our readers some idea of the extraordinary development of this branch of native African industry and commerce, we append a statement which will exhibit it at a single glance. We have only to observe that we

are indebted to Thomas Clegg, of Manchester, for these interesting particulars, and that the quantities ordered have been obtained from Abbeokuta alone. He is about to extend the field of his operations. Four Europeans have gone out, expressly to trade in native cotton; and several London houses encouraged by the success which have attended Mr. Clegg’s experiment, are about to invest largely in the same traffic. The quantity of raw cotton which has already been imported into England, from Abbeokuta, since 1851, is 276,235 lbs., and the trade has developed itself as follows:

1851-52	9	bags or bales	1810
1853	37	“	4617
1854	7	“	1588
1855	14	“	1651
1856	103	“	11,492
1857	283	“	35,419
1858	1819	“	220,099

The last importation includes advices from Lagos up to the first of last November. Since that time, the presses and other machinery sent out have been got into full work, and the quantity of the raw staple in stock has rapidly accumulated, the bulk shipped being on “native account.” Each bag or bale weighs about 120 lbs. Let it be borne in mind that the whole of this quantity has been collected, all the labor performed and the responsibility borne, by native Africans; while the cost of production, Mr. Clegg informs us, does not exceed one half penny a pound in the end. It can be laid down in England at about 4½*d.* and sells at from 7*d.* to 9*d.*—*London Anti-Slavery Reporter*.

THE COINS OF JAPAN.

The Director of the United States Mint communicates to the *Philadelphia Pennsylvanian* some interesting and important facts, the result of investigations at the assay office into the character and value of Japanese coin. It appears that the series of Japanese coin consists of three sizes of gold, two of silver, and three of an alloy of inferior metals. They present features which set them apart from every other system of coinage in the world. These coins are thus described:

“The principal gold coin, known as the *cobang* or *cobank*, is of an oval shape, about two and a half inches long, and half as wide. It is very thin, soft, and easily bent, having no elasticity; its appearance is that of fine gold, and its surface is marked by sundry figures not well understood as yet, although it is said that the flowery ornaments are ‘the arms of the spiritual emperor,’ and that a central cipher is the special imprint of the ‘Inspector General of money.’ The weight, two specimens agreeing, is 362 thousandths of an ounce, or nearly 174 grains. Next is a gold piece of one-fourth that weight, and intended as

a quarter of the preceding, called the 'gold itzebu,' but its form is entirely different. It is four-sided, rectangular, and very thick; three-fourths of an inch long, and half that in width. The smallest gold coin is the half itzebu, of proportional size. We have then the silver itzebu, and its quarter of the same domino shape; the larger piece weighing 2.80 oz. or 134½ grains. Passing to the 3d division, there is the 'hundred p'senny,' a casting of red brass, oval and thick, measuring two inches long, and a little more than half as wide, with a hole in the centre. Finally there are pieces of four, and one p'senny circular with holes in the centre, and scarcely to be distinguished from the well known Chinese *cash*."

The cobang and itzebu, although they have the appearance of fine gold, are in reality a composition formed of gold and silver in nearly equal proportions, and their intrinsic values, according to our mint rates, are \$4 44 for the cobang, and nearly \$1.11 for the itzebu.

Although ignorant of the coining processes of other nations, Japan has imitated and even exceeded them, in the process of deterioration of moneys. About the beginning of the last century, the cobang, quite similar in shape and device to the present piece, weighed 272 grains, was 854 fine, and worth just ten dollars. A century later, it had fallen to 196 grains, 607 fine, and worth (including silver) five dollars and seventy-eight cents. The smallest gold coin evidently contains but little gold, and therefore has a forced valuation. In striking contrast to these examples of depreciation, the silver coin is found to be of almost absolute fineness, that is 991 thousandths, and worth 37 cents. The smallest silver piece is apparently not inferior in fineness. Why the Japanese debase gold and not silver, is an unsolved question. The gold and silver itzebu are, as is stated, interchangeable; that is, a piece which is worth in our eyes 111 cents (and to a Japanese, worth nearly as much as two of our gold dollars, because he supposes it to be much better gold than it is,) buys no more than a piece which, with us, would be 37 cents. The Spanish or Mexican dollar they consider equal to three itzebu, which is three-fourths of a cobang, or \$3 33—*Boston Journal*.

COMPOSITION OF THE HUMAN BODY.

It is ascertained that a man of 154 lbs. weight contains 116 lbs. of water, and only 38 lbs. of dry matter. From his skin and from his lungs water is continually evaporating. Were the air around him perfectly dry, his skin would become parched and shrivelled, and thirst would oppress his feverish frame. The air which he breathes from his lungs is loaded with moisture. Were that which he draws in entirely free from watery vapor, he would soon breathe out the fluids which fill up his tissues, and would dry up into a with-

ered and ghastly mummy. It is because the simoom and other hot winds of the desert approach to this state of dryness, that they are so fatal to those who travel in the arid waste. Prof. Que-telect states that of the 38 pounds of dry matter in the model man, 24 lbs. are flesh and fat, and 14 lbs. bone; 28 lbs. are organic matter, combustible, and 10 lbs. mineral matter, incombustible. If a hundred pounds of human blood be rendered perfectly dry, by a heat not much exceeding that of boiling water, it will be reduced in weight to somewhat less than 22 pounds.

A PRETTY CONCEIT.

We find the following paragraph in an exchange:—"We yesterday saw, in the parlor of a friend, a very beautiful conceit. It is, of course, the fancy of a lady, and consists of the burr of a pine tree placed in a wine glass half full of water, and from the different layers of the burr are shooting forth green blades—bright, beautiful refreshing. For a little thing, we have seen nothing that so pleased us by its beauty and novelty. And the secret is this, the burr was found dry and open; the different circles were sprinkled with grass seed, and it was placed in a wine glass, with water in as above. In a few days the moisture and nourishment gave the burr life and health;—the different circles closed and buried within themselves the grass seed, and a few days more gave to the seed also life, sprout, and growth; and now a pyramid of living green, beautifully relieved by the sombre hue of the burr, is the result—as pretty and novel a parlor ornament as we have for a long while seen."

ITEMS OF NEWS.

TELEGRAPH.—The London *Times* says that a single message over the cable when first opened, by which the embarkation of the Canadian regiments for India was countermanded, saved the government at least \$250,000.

RUSSIA.—An estimate has been drawn out of the expense of establishing an electric telegraph which will cross the whole of Eastern Russia and Siberia, and end at the Pacific.

THE CZAR has conceded permission to a joint stock company for the construction of a railway from the Don to the Volga. By this means the Mediterranean and Black Seas, the Sea of Azov, the Caspian Sea, Central Asia, and the most distant regions of Siberia, will be placed in communication with Odessa, Vienna, Paris and London.

TRANSPORTING A STEAMER.—On the 8th of last mo., the work of taking a steamer to pieces for the purpose of transporting her to the Red River of the North, was commenced at Crow Wing, Minnesota. The whole, boilers, machinery, and all, would have to be carried on runners a distance of one hundred and sixty-five miles.

MANUMISSION OF SLAVES.—It would have made a slave speculator's heart bleed to have seen the 'drove' of eighteen slaves that made their appearance in the streets yesterday, on the broad road to Freedom—by no "underground" route, either. There were nine

males and nine females, consisting of a father and mother, and their children and grandchildren, and one mulatto woman with four boys between the ages of seven and thirteen. As they passed up Vine street, headed by Robert Barnett, an old gentleman nearly seventy years of age, a resident of Lincoln county, Ky., they attracted general attention, and occasioned a thousand remarks.

The party were all taken to the Probate Court, where the usual deeds of emancipation were executed. While in Covington, before crossing the river, their owner was offered \$20,000 for them, but he quietly remarked: "I would not take fifty thousand."—*Cincinnati Gazette*.

A SLAVER ASHORE.—Advices from Key West, to the 6th inst., state that the schooner *Hermitage*, Atwill, arrived that morning from Garden Key, with the officers and crew of a slave brig ashore on the Marquesas Shoal, upon which she had been run to destroy the evidence of a successful slave-trip. The men would leave for Havana in the *Isabel*, unless the United States saw fit to arrest them. The brig's name is *Martha Regan*, a hermaphrodite, about 250 tons burthen, 4 years old, Eastern built. She had a slave deck, and a large quantity of water casks and some provisions. She had doubtless put some hundred slaves ashore lately on the Cuban coast.

In the Louisiana Legislature, the African Apprenticeship bill of last session, a virtual renewal of the African slave trade, was taken in the House of Representatives on the 5th inst., and laid upon the table by a vote of 37 to 17. A motion to reconsider was also laid on the table, thus effectually disposing of the bill for this session.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market shows some firmness in prices. We quote sales of superfine Flour at \$6 50 per bbl., and \$6 62 a 6 75 for extra family. The sales to the retailers and bakers are within the range of the same figures, and fancy lots at from \$7 25 to 7 50. Sales of Rye Flour and Corn Meal continue limited. The former at \$4 37 a 4 50. Corn Meal is held at \$3 87.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 58 a 1 60 per bushel for fair and prime red, and \$1 70 a 1 80 for prime white. Rye sells as fast as received, at 95 cts. Corn is in demand; sales of yellow at 87 a 88 cts. Oats are steady; sales of prime Pennsylvania at 56 cts., and Delaware and Jersey at 55 cts.

CLOVERSEED comes in freely and sells at from \$5 75 to 6 00 per 64 pounds. Timothy commands \$2 25 a 2 37 per bushel, and Flaxseed at \$1 70 a 1 75.

LATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON, } Assistants.
MAGGIE B. JACKSON, }
Address Kennet Square P. Office, Chester Co. Pa.
WILLIAM CHANDLER, } Proprietors.
SUSANNA G. CHANDLER, }
3d mo. 19, 1859.—10 t.

ELDRIDGE'S HILL BOARDING SCHOOL FOR THE EDUCATION OF YOUTH OF BOTH SEXES.—All the branches of a liberal English Education

are thoroughly taught in this Institution. Also the French and Latin languages.

The summer session will open on the 3d of 5th mo., 1859, and continue 20 weeks, terms \$70 per session.

For full particulars address the Principal for a circular.

ALLEN FLITCRAFT,
Eldridge's Hill, Salem County N. J.

2 mo.

BOARDING SCHOOL FOR GIRLS, WEST CHESTER, PA.—In this institution, an opportunity is afforded of pursuing any of the various branches of science usually taught in the schools, and it is the constant object of the Principal, so to blend instruction that while giving clear and practical knowledge of those branches, the mental and moral culture may keep pace with the acquisition of literature and science.

The domestic arrangements are as nearly as possible those of a private family, and especial care is taken to provide for healthful exercise in the fresh air.

Pupils should be provided with their own towels, soap, clothes-bags, over-shoes and umbrellas, and clothing should be distinctly marked.

The school year consists of ten months, commencing on the first 2d day in 9th month.

TERMS.—\$150 per year, payable quarterly in advance. The Languages, Drawing and Coloring, extra. Books furnished on rent or at the usual retail prices.

E. W. RICHARDS, Principal.

West Chester, 2nd mo. 8th, 1859.

ATTLEBOROUGH ACADEMY FOR RENT.—The present occupant, Sidney Averil, being about to remove to his farm in the State of New York, the Building and premises are for rent, situated in a healthy neighborhood, and thickly settled; the opening for a boarding and day school, with a competent Teacher, is seldom surpassed, as the experience of the present Teacher will show. His school, for three past years, averaging boarders and day scholars, 120.—Rent moderate. Apply to either of the owners of said Building, living in Attleborough, Bucks Co., Pa.

ISAAC LIVEZEY, JOSHUA RICHARDSON,
JAMES FLOWERS, M. W. ALLEN.

Attleborough, 2nd mo. 14th, 1859.

ORANGE GREEN BOARDING SCHOOL FOR GIRLS.—The Summer Term will commence on the 11th of 4th month next. The location is unusually healthy and pleasant; the course of study extensive and thorough. Terms Thirty-six Dollars per session of thirteen weeks.

For particulars, address Principals,

SIDNEY PUSEY, or
FANNY A. KINSEY.

Kennett Square, Chester Co., Penna.

2d mo., 1859.—2m.

BYBERRY BOARDING SCHOOL FOR GIRLS.—The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 21st of 2d mo. 1859, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

TERMS.—\$60 per session, one half payable in advance.

For Circulars containing further particulars, address

JANE HILLBORN,

1st mo. 22d, 2m Byberry P. O., Philada., Pa.

Merrihew & Thompson, Prs. Lodge street, north side Penna. Bank

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FOURTH MONTH 2, 1859.

No. 3.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

MEMOIR OF EVAN THOMAS.

He was born in Montgomery county, Maryland in 1733. The object of this memorial is to hold up to survivors the example of one who has peacefully finished the career of probation, and, by exhibiting a condensed view of the prominent steps, by which he was conducted through the chequered scenes of life, to endeavor to impress on our minds, that the Spirit of truth (the only safe guide, and which is one in all, whether as a reprover or a refiner, a leader or a comforter, according as our various states and conditions require) still follows us, in all our wanderings, in order to bring us back to the true fold of rest and peace.

From some documents left by him, it appears that his mind was at an early age solemnly impressed with religious sensations, and often deeply affected in reading the journals and other writings of primitive Friends, in which are recorded their trials and sufferings for conscience' sake; and that desires were then excited, that he might attain to a measure of that faith and patience, which they manifested under the most trying dispensations: thus furnishing evidence, that at an early period in life, the mind is susceptible of divine impressions, and that the touches of the heavenly Father's love are coeval with the first dawn of reason and reflection. But there is a countervailing influence, which too often effaces these precious impressions. Collision with a world lying in wickedness, has a powerful tendency to stamp upon the soul its own harsh features, in place of the fair characters delineated by the Divine hand.

It appears by these documents, that before he had reached his sixteenth year, the contaminating influence of evil communication had nearly

obliterated all the traces of those tender impressions which had been made upon his mind; and that, about this time, a severe sickness, from which recovery seemed very doubtful, was the means used, in the ordinations of Infinite Wisdom, to draw him back into the paths of innocence and safety. Under this heavy affliction, from a distressful consciousness of departure from the pointings of truth, he was reduced to a willingness to enter into covenant with the Creator and Preserver of men, that if he would spare him longer he would endeavor to be more circumspect in life and conversation. For about four years after his recovery from the above mentioned sickness, he passed his time mostly in retirement, being chiefly employed in reading and study, and was in some measure preserved from relapsing into the spirit of the world. But soon another trial of his steadfastness succeeded. With some young men in the neighborhood, possessing a literary taste and fascinating manners, he formed an intimate acquaintance; and not perceiving, at first, that under this imposing exterior there were concealed libertine principles, the fruitful source of licentious morals, his mind, by insensible degrees, became alienated from the love of retirement, and he was led gradually into the vortex of a very corrupting and dangerous association, in which he continued for several years. Although he was preserved from the grosser vices, and, on that account, ventured to consider himself as standing on safe ground, yet the Keeper of Israel, who slumbers not, nor sleeps, did not permit him to remain at ease, in this state of false security; for in seasons of retirement, and in the solitary hour, the Witness for truth in the soul, that Teacher that cannot be removed into a corner, would break in upon every false rest. Often was the day, which had been spent in unprofitable company, or in idle or profane conversation, succeeded by a night of deep condemnation. A return to company and amusement was the usual though ineffectual recourse for quieting these uneasy feelings, and counteracting these heavenly visitations, which in one state of the mind will be hailed as inexpressibly precious, while in another they will be viewed with aversion. Thus, in alternations of disobedience and remorse, he continued until the year 1766, when he entered into the married state.

From this time, ambition for distinction in

the world took possession of his mind, and circumstances soon after occurred which were favorable to the growth and development of such feelings. During the ferment which about that time began to agitate the United States, then British colonies, and which eventuated in the revolutionary war, he was carried along with the popular current; and having been present at a general meeting of the county, called on occasion of the alleged public grievances, he was chosen a delegate to the first convention of the State held at Annapolis, which he attended; and the proceedings adopted by that body appearing, in his view, not to be inconsistent with the principles professed by Friends, received his support. But when, under the illuminating influence of that faithful Monitor of the soul, which continued to follow him, his understanding was opened clearly to perceive that the measures which he was promoting would eventually lead to open war, he immediately withdrew from any farther active agency in public concerns, and although returned a delegate to the second convention he declined serving. This devotion to principle was followed by farther openings of that light, which discovers to us our true standing in the sight of Infinite Purity; and, by an increased faithfulness, he became more and more humbled under the operation of the Divine hand, and was rendered willing to resign that ambitious love of distinction, which had heretofore so entirely engrossed his attention. The conflict between inclination and a clear sense of duty was great. To give up those flattering prospects of worldly honor, to one occupying a prominent station in society and in the prime of life, during an eventual crisis of public affairs, was found to be a sacrifice which could only be made by a dedication to religious principle. The sacrifice, however, was called for, and it was made; and he has left the assurance that, in the peace which followed, there was an abundant recompense.

The Society of Friends, of which he was a member, had, until this time, in common with others, fallen very generally into the practice of keeping slaves; but as every act of obedience to the manifestations of truth upon the mind, prepares the way for further openings of divine light upon our understandings, so "the Spirit which searcheth all things," discovered to him the iniquity of holding his fellow-men in a state of personal bondage; and yielding to the visitation, he soon became entirely convinced of its inconsistency with that primary duty of a Christian, which is "to do unto others as we would they should do unto us." He was strengthened faithfully to bear an upright testimony against the practice, though then a generally prevailing one, by manumitting, and restoring to their just rights those of the African race who were in his possession. This compliance with duty, it appears, not only disencumbered his

mind from a heavy burden, which had sorely pressed upon it, but opened his way for future usefulness in the church.

From this time, he became diligent in the attendance of meetings, and active in the exercise of the discipline of the religious society to which he belonged, and was soon laid under the necessity of testifying to others what the Lord had done for him, in order to encourage them in the path of righteousness. During the revolutionary war, he suffered great loss of goods, in support of his testimony to the peaceful character of Christ's kingdom, as well as for refusing to take the oath of allegiance, and for declining to pay taxes, levied for the support of the war. He also suffered deeply for the exercise of his gift as a minister of the gospel. All which trials, it appears, he bore with patience, meekness, and an unshaken reliance upon Divine support. He had a clear and strong testimony against the use of intoxicating liquors, as a beverage, which, by a consistent example, he sustained to the close of life. Within a short time before his decease, he stated, with great emphasis and feeling, in a public meeting, that for the last sixty years he had not, to his knowledge, swallowed one drop of distilled spirits, nor in any degree indulged in the unnecessary use of intoxicating drinks.

In the love of the gospel, which enlarges the soul in affectionate desire for the welfare of others, he was often engaged to travel abroad, and appoint religious meetings, both among Friends and other people, in which service he was frequently occupied as long as physical strength would permit; possessing strong powers of mind, and a highly cultivated understanding. In the exercise of his ministerial gift, he was concise, clear, and convincing; and being affable in his manners, he generally gained the respectful notice and regard of those to whom his labors were directed. Under the influence of that charity which breathes peace on earth and good will to men, he was led into deep sympathy for the Indian natives of this country; and when far advanced in life, visited some of the tribes north-west of the river Ohio. In this visit, through a country then a wilderness, he endured many privations, and suffered much fatigue and exposure, and has often been heard to say, that he felt peace of mind and gratitude for that Divine protection and support which he experienced throughout the arduous service. Those among whom many years of his life were passed, can testify that he departed himself with innocence and childlike simplicity, conformably with the meekness and gentleness of Christ. He was in possession of that love which is the essential characteristic of the gospel; and, to the last, he bore testimony with clearness to the universality and efficacy of the "One Spirit," by which all who yield to its influences are bap-

tized into one body, and become living members of the church of Christ. In a word, he adorned the doctrine of God our Saviour in all things, by a life and conversation becoming the gospel.

He appeared, for some time before his last sickness, to have a presentment that the time of his sojourning was drawing to a close, and frequently mentioned it to his family, accompanied with the consolatory reflection, that he was prepared to obey the summons, that he felt no fears, and saw no cloud in his way: that, having honestly endeavored to be faithful to the discoveries of duty upon his mind, he could adopt the testimony of the apostle, when he had the termination of life full in view: "The time of my departure is at hand. I have fought the good fight, I have finished my course, I have kept the faith: henceforth, there is laid up for me a crown of righteousness, which the Lord, the righteous Judge, will give me at that day, and not to me only, but unto all them that love his appearing." In this resigned state, he remained patiently awaiting his change, and quietly departed, the latter part of 1826, in the 88th year of his age.

One of the most important requisites of a holy life is *patience*; and by this, we do not mean merely a meek and quiet temper, when one is personally assaulted and injured; but a like meekness and quietness of temper in relation to the moral and religious progress of the world. We may be deeply afflicted in view of the desolations of Zion; but let us ever remember and rejoice, that the cause of truth and holiness is lodged safely in the hands of God. With him a thousand years are as one day; and in the darkest moments, when Satan seems to be let loose with tenfold fury, let us thank God and take courage, because the Lord God Omnipotent reigneth.

KNOWLEDGE OF THE TRUTH.

BY THOMAS A KEMPIS.

Blessed is the man whom eternal Truth teacheth, not by obscure figures and transient sounds, but by direct and full communication! The perceptions of our senses are narrow and dull, and our reasoning on those perceptions frequently misleads us. To what purpose are our keenest disputations on hidden and obscure subjects, for our ignorance of which we shall not be brought into judgment at the great day of universal retribution? How extravagant the folly to neglect the study of the "one thing needful;" and wholly devote our time and faculties to that which is not only vainly curious, but sinful and dangerous as the state of "those that have eyes and see not!"

What have redeemed souls to do with the dis-

tinctions and subtleties of logical divinity? He whom the eternal Word condescendeth to teach is disengaged at once from the labyrinth of human opinions. For "of one word are all things;" and all things without voice or language speak Him alone: He is that divine principle which speaketh in our hearts; and, without which there can be neither just apprehension nor rectitude of judgment. Now, He to whom all things are but this one; who comprehendeth all things in His will, and beholdeth all things in His light; hath "his heart fixed," and abideth in the peace of God. O God, who art the truth, make me one with Thee in everlasting love! I am often weary of reading, and weary of hearing; in Thee alone is the sum of my desire! Let all teachers be silent, let the whole creation be dumb before Thee, and do Thou only speak unto my soul!

The more a man is devoted to internal exercises, and advanced in singleness and simplicity of heart, the more sublime and diffusive will be his knowledge. A spirit pure, simple, and constant, is not like Martha, "distracted and troubled with the multiplicity of its employments," however great; because, being inwardly at rest, it seeketh not its own glory in what it does, but "doth all to the glory of God:" for there is no other cause of perplexity and disquiet, but an unsubdued will and unmortified affections. A holy and spiritual mind, by reducing them to the rule and standard of his own mind, becomes the master of all his outward acts; he does not suffer himself to be led by them to the indulgence of inordinate affections that terminate in self, but subjects them to the unalterable judgment of an illuminated and sanctified spirit.

No conflict is so severe as his who labors to subdue himself; but in this we must be continually engaged, if we would be strengthened in the inner man, and make real progress toward perfection. Indeed, the highest perfection we can attain to in the present state is alloyed with much imperfection, and our best knowledge is obscured by the shades of ignorance; "we see through a glass darkly:" an humble knowledge of thyself, therefore, is a more certain way of leading thee to God than the most profound investigations of science. Science, however, or a proper knowledge of the things that belong to the present life, is so far from being blamable, considered in itself, that it is good, and ordained of God; but purity of conscience, and holiness of life, must ever be preferred before it; and because men are more solicitous to learn much than to live well, they fall into error, and receive little or no benefit from their studies. But if the same diligence was exerted to eradicate vice and implant virtue, as is applied to the discussion of unprofitable questions, and the "vain strife of words;" so much daring wickedness would not be found among the common ranks of men, nor so much licentiousness disgrace those who are

eminent for knowledge. Assuredly, in the approaching day of universal judgment, it will not be inquired what we have read, but what we have done; not how eloquently we have spoken, but how holily we have lived.

Tell me, where is now the splendor of those learned doctors and professors, whom, while the honors of literature were blooming around them, you so well knew, and so highly revered? Their emoluments and offices are possessed by others, who scarcely have them in remembrance: the tongue of fame could speak of no name but theirs while they lived, and now it is utterly silent about them: so suddenly passeth away the glory of human attainments? Had these men been as solicitous to be holy as they were to be learned, their studies might have been blessed with that honor which can not be sullied, and that happiness which can not be interrupted. But many are wholly disappointed in their hopes both of honor and happiness, by seeking them in the pursuit of "science falsely so called;" and not in the knowledge of themselves, and the life and service of God: and choosing rather to be great in the eyes of men, than meek and lowly in the sight of God, they become vain in their imaginations and their memorial is written in the dust.

He is truly good, who hath great charity; he is truly great, who is little in his own estimation, and rates at nothing the summit of worldly honor: he is truly wise, who "counts all earthly things but as dross, that he may win Christ;" and he is truly learned, who hath learned to abandon his own will, and do the will of God.

Imitation of Christ.

For Friends' Intelligencer.

"O Jerusalem, Jerusalem, thou that killest the prophets and stonest them which are sent unto thee, how often would I have gathered thee even as a hen gathereth her chickens under her wings, and ye would not—behold, your house is left unto you desolate." "If thou hadst known, even thou, at least, in this thy day, the things that belong unto thy peace! but now they are hid from thine eyes. For the days shall come upon thee, that thine enemies shall cast a trench about thee, and keep thee in on every side, and shall lay thee even with the ground, and thy children within thee; and they shall not leave in thee one stone upon another; because thou knewest (regarded) not the time of thy visitation."

Here was foretold an impending calamity, which should have produced awe, and humbled into repentance; but it seems to have been but little heeded. Are we, the inhabitants of these United States, determined on a like course? Are we regardless of witnessing these or similar calamities verified upon ourselves?

"How often would I have gathered thee, but thou wouldst not!" how often Christ, the Heav-

enly Shepherd and Bishop of souls, would have gathered us out of the prevailing sins of this nation, war, and slavery, but we "would not."

Oh! how have the messages of Divine love, sent to the heart by the Holy Spirit, been despised and rejected, which, had they been received and submitted to, would have gathered us out of these iniquities, as certainly as light dispels darkness.

"God is love," and love, like light, is a principle possessed of power to overcome its opposite; and what is so at variance with the nature of love, as war and slavery? If a tree is "known by its fruit," and in neither war nor slavery is there any fruit characteristic of love, then these institutions cannot be of God—but that they are of man's degeneracy, must be evident to every unprejudiced mind.

A long continuance in the rejection of the testimony of truth inwardly manifested, leads to a rejection of it when conveyed through instrumental means—hence the stoning, mobbing, and imprisoning, experienced by many of those who have borne testimony against the slave system, which is also war in its most odious form.

Are we not the representatives of our forefathers, who fled to this country from persecution? And shall we become persecutors ourselves? Shall we systematically practice upon the largest scale, what we have deprecated in others, as unjust and unchristian? Shall we support a legalized system, that deprives four millions of our fellow men of their manhood, and which reduces them to the character of merchandise and working animals?

If righteousness is requisite for exalting a nation, then unrighteousness, if persisted in, must produce its downfall, and great must be the attendant suffering.

War and slavery are kindred evils, both spring from the same root, both are based upon the same principle, "That might is right," and both produce the same corrupt fruit.

We profess to be Christians, and this profession for several hundred years after the introduction of Christianity, was deemed a sufficient reason, for declining to fight—why then do we not try these systems by Christian principles? If we take the blessed Jesus as our example, we can find nothing in his precepts or practice that justifies war or slavery—on the contrary, they strike at the very root of both. War is based upon the principle of retaliation of injuries, either real or assumed—Christianity, upon love, the forgiveness of injuries, "when reviled, that we revile not again; to do good for evil; when smitten on one cheek, to turn the other also; to love, not only friends, but enemies, and even pray for those who despitefully use us, and persecute us; that ye may be the children of your Father which is in heaven." The principle that produces these recorded testimonies, is the same

unchangeable, quick, and powerful witness for God in our own souls, teaching all the willing and obedient these same Christian doctrines, "Whatsoever ye would that men should do unto you, do ye even so to them."

We are not dependent upon outward testimony to know slavery and war to be unjust, having the witness in ourselves that testifies against all unrighteousness and "ungodliness in men."

What can be more repugnant to the laws of Christian love, than to behold a people making systematic, deliberate preparations, for the destruction of their fellow men? What so shocking to contemplate, as army arrayed against army, equipped with the most destructive weapons the skill of man can invent, with their professed Christian ministers on either side, praying to the same God for success?

It has been publicly asserted that "nineteen twentieths of the taxes paid in the United States, go to the support of a military system." Was this exorbitant demand made in the form of a direct tax, enquiry might be awakened which would endanger the system;—to prevent such a result, it is mingled with other and laudable interests, and thus the tax is collected by such indirect means, that the tax-payer is kept in ignorance of the amount drawn from him to support the unchristian system.

This association of war, with greatness and honor is often implanted in the youthful mind at school, by the study of histories, where military achievements and characters are held up to admiration in the most eloquent language, only due to Christian virtue. The delusion thus implanted, is strengthened in manhood, by the applause and respect paid in periodicals and other publications, to military officers and military success; costly monuments are erected, with great pomp and parade, to do honor to the man who has proved himself the most skilful in the art of destroying the lives of his fellow men!

Is this not putting darkness for light, error for truth, and evil for good? Let moral and Christian virtue be the test of respect and merit, and how different would be the characters of those elevated to important places of trust and influence.

Now, military glory goes far in securing to some the first and most important office in the gift of the people—and there can be no doubt that many obtain seats in Congress, rather for their skill in harangue and political intrigue, than for solid and sterling virtues. Is it strange that at the National Capital morality is at so low an ebb; even trodden under foot to a degree that would disgrace the lowest class in the community, so that even life, there, seems insecure? Are not these evidences of a dark age near at hand? Does not the aspect of the times imperatively call for a reform in principle? an individual, heart reform, that would enable its vo-

taries to breathe forth the anthem of "Glory to God in the highest, on earth peace and good will to men"—a reform that would "break every yoke, and let the oppressed go free." It is being Christ-like that entitles us to the appellation of Christians; in agreement with the declaration of Jesus, "if ye sow to the flesh, of the flesh ye shall reap corruption; but if to the spirit, life everlasting." How important, then, that we be not deceived by others, nor deceive ourselves, where so much is at issue pertaining to our enjoyment in this world and the world to come.

D. I.

EPISTLE XIV.—1691.

Dear and Faithful Friends and Brethren:—
We tenderly salute you all in our Lord Jesus Christ, and blessed union of his precious life; who hath eminently appeared among us and with us in this our heavenly solemnity, still ministering fresh encouragement unto us, by his divine power and counsel, to persevere in faithfulness and diligence in his work and service to the end of our days, and finishing our course with joy, as many of his dear ancient and faithful servants have already done. Blessed be his glorious name forever.

We are much comforted at this, our weighty assembly, in the many good accounts given as heretofore of truth's prosperity, and the increase of Christ's kingdom, and the abounding of love, peace, and unity among Friends; and the decrease and dying of the spirit of division and enmity in divers places where it has entered; and that meetings are increased, and many people's hearts opened to hear and receive the truth; and that in some places new meeting-houses are erected, and others about preparing and building, which are and will be of great advantage for truth's promotion, we doubt not, as experience hath long and clearly shown; and that good order and Christian care in your meetings aforesaid, is, and we hope will be, continued in the service of truth and one another, to the honor of God, and exaltation of his holy name and truth, and the strengthening and encouraging of Friends in general, and one another in the service thereof; which our souls earnestly desire and hope you will ever be mindful of; that our God may have his praise, and you all your lasting peace and comfort.

We perceive the suffering that chiefly remains on faithful Friends in divers counties, by imprisonment and spoil of goods, doth increase, for our ancient Christian testimony against the old and grand oppression of tithes; we have now accounts of about eighty Friends prisoners on that account, whose faithfulness the Lord will reward. And we desire that the same Christian testimony may be duly kept up, and such as are unfaithful therein, be diligently exhorted to obedience

and faithfulness to Christ Jesus, that they may not strengthen the persecutor's hands, increase other's sufferings, nor make void truth's testimony therein, which so many have offered up and laid down their lives for. These things are also recommended to your Godly care, and it is our tender and Christian advice, for the Lord's sake, and his blessed name and truth's sake, that Friends be diligent in keeping their Weekday Meetings as duly as on First-days, in his worship and service, and that you do encourage the faithful women's meetings, and the settling them where they are wanting, and may with convenience be settled; knowing their service, and what need there is also of their godly care in the church of Christ in divers weighty respects proper to them. And that great care be taken about marriages, for the consent of parents, due and orderly publication thereof, and solemnizing of them in a meeting appointed for that end and purpose, which method is convenient and commendable, as it has been lately made appear in the eye of the government, and well resented, and that Friends be reminded of this meeting's former advice against marriage with near kindred, and against marrying by priests, and with persons of the world, unequally yoking with unbelievers; and against too early and unsavory proceedings in second marriages after the death of husband or wife, contrary to the due method and practice of faithful Friends, in truth, and tending to the dishonor and reproach thereof.

And that Friends take care to keep to truth and plainness, in language, habit, deportment and behaviour, that the simplicity of truth in these things may not wear out nor be lost in our days, nor in our posterity's; and be exemplary to their children in each, and train them up therein; that modesty and sobriety may be countenanced, and the fear of the Lord take place and increase among them; and to avoid pride and immodesty in apparel, and extravagant wigs, and all other vain and superfluous fashions of the world; and in God's holy fear watch against and keep out the spirit and corrupt friendship of the world; and that no fellowship may be held or had with the unfruitful works of darkness, nor therein with the workers thereof. And to avoid unnecessary frequenting taverns, ale-houses, all looseness, excess and unprofitable and idle discourses, mispending their precious time and substance, to the dishonor of truth, and scandal of our holy profession.

Let your godly care and earnest endeavors be to stop and prevent all reproaches and scandals in these or any other cases. And that all Friends watch over their children; and none to indulge or suffer them in pride, or corrupt liberty, whereby they become exposed to the world, to be ensnared either in their marriages or evil conversation tending to their hurt and ruin. And that Friends keep to their wonted example and testi-

mony against the superstitious observation of days.

It is also the advice of this meeting, that all and every one of your meeting-houses, and mansion-houses where meetings are or may be, be entered upon record, as the law directs, each particularly, we having seen both the service and safety thereof, and the hurt and danger that may come by omission. And that care be taken in each Monthly Meeting that Friends who have estates to dispose of by will or otherwise be particularly advised to make their wills or settle their estates in due time. To prevent the inconveniences, loss and trouble that may follow upon their relations and friends, and injury to the poor through their dying intestate; delays and omissions in this case having been very prejudicial in divers respects.

We are glad to hear that care is taken in some places, according to former advice, for the providing of school-masters and mistresses who are faithful Friends, to instruct Friends' children in such a method as truth allows. And we desire that Friends go on in that care to promote such education and schools, for the advantage of their children and posterity.

Divers good epistles and accounts were read in this meeting for foreign parts; as Scotland, Ireland, Amsterdam, Dantzick, Jamaica, Nevis, Maryland, Rhode Island, (and two from Friends, captives at Mequinez, in Barbary, under the emperor of Morocco) intimating the prosperity of truth, and the peace and unity of Friends among themselves, and their love to Friends in this nation, and in many places their want of faithful laborers; and their desire for the spreading of truth as much as may be, both by Friends' books and ministry, and also to be furnished with books as Friends can send them.

There yet remain nine English Friends captives at Mequinez, and three at Murbay, who have received the truth there, (it being three or four day's journey distant) who correspond with each other by letters. One Friend, (to wit, Joseph Wasey) being lately redeemed, and newly come over, gave a large account to this meeting, of their miserable hard usage in captivity; having no lodging but under arches in deep places on the cold ground, both winter and summer, only water for their drink; and no bread allowed them by the king, but that made of old, rotten, stinking barley, and no clothes, but a fresh one in two years; and forced to hard labor (except three days in year,) and more especially on the 6th day of the week (which was their day of worship,) they are compelled to carry heavy burdens on their heads, running from sun-rise to sunset, with brutish black boys following with whips and stripes at their pleasure.

Many of the other captives perish and die, through their extreme hardships, and want of food to sustain them; as in all likelihood Friends

there had, if Friends and their relations here had not sent them some relief; seven pence a month, formerly allowed them by the king, being now taken from them. Their sufferings are lamentable, yet the Lord's favor has wonderfully preserved them, and greatly restrained the fury and cruelty of that emperor towards poor Friends there, in whose behalf the said Joseph Wasey did, through an interpreter, speak to the said emperor, giving him an account of their innocent conversion and religion, which he heard with moderation, though he often kills men in cold blood at his pleasure.

Joseph Wasey also signified that Friends' day-time being taken up with servitude, they are necessitated to keep their meetings in the night season to wait on God. And that the aforesaid captive Friends were very thankful for the relief sent from hence, which was very refreshing to them.

An epistle from Friends' Half-Year Meeting, in Ireland was read, giving an account, that notwithstanding Friends' great sufferings and exercise in that kingdom, Friends there have been well supported by the Lord's power under the same, having yet left them wherewithal to relieve them that stand in need, and are impoverished. And accordingly our dear and ancient Friend, William Edmondson, (who lately came from Ireland, having with his family undergone great suffering) also acquainted the meeting, that although Friends there have undergone great suffering and losses, yet care is taken that no Friends need now come from thence for want of a present supply, or without a certificate from Friends of some meeting there. Wherefore, if there be necessity hereafter to minister to their relief when they are capable to receive and make use thereof, it is left to the care of the meeting here for sufferings to give you notice thereof in its time and season when further necessity shall require.

We do also acquaint you, that the Friends appointed by this meeting to inspect the accounts report back to this meeting, that they find them truly stated, and fairly kept, and nothing of what was contributed towards captives' redemption is disbursed this year past, no opportunity having yet presented itself for their redemption, though much endeavored; but sixty pounds added, being repaid by Leven Buskin, who was a captive redeemed from Algiers some years since. But that the contribution intended for the ease and relief of suffering and necessitous Friends, is wholly expended and in debt, by reason of the urgent occasions to endeavor the ease and relief of Friends that do or may suffer in divers general cases (and also the charity bestowed upon divers of our suffering Friends and brethren of Ireland, both there and here,) wherein our Friends of London have been very indus-

trious, and intend not to be wanting therein, as the Lord shall yet afford opportunity.

Whereupon, they offer it to this meeting as their judgment, that it is needful there should be a further supply, by a general contribution among Friends, for the like service, to be made this year. Which being duly and weightily considered, this meeting agrees unanimously that a contribution be made by Friends throughout all the several meetings of Friends in England and Wales, for the supply and service of Friends and truth, as aforesaid.

And it is recommended by this meeting to the Quarterly and Monthly Meetings aforesaid, who are desired to take care therein with as much convenient speed as may be; and to return the collections to the six Friends of the city, who are intrusted this year with the accounts; Thomas Lacy, Thomas Cooper, George Green, Henry Wilson, Joseph Wright, and Cornelius Mason, or any of them.

This meeting agrees, for the taking off and spreading of Friends' books for the service of truth, that such a number of Friends' books as shall be hereafter printed by their approbation (excepting collections of books,) be taken off by each Quarterly Meeting, as will only amount to two books of a sort to each Monthly Meeting, providing the two books do not exceed one shilling in price. And if any one book be above six-pence in price, then but one of that sort to each Monthly Meeting; who may send for as many more as they have occasion for, or desire, (we understand there are about 151 Monthly Meetings in England and Wales) and that the said books be sent by the several correspondents in London, (or by their order) to the correspondents of each county, who are desired to send up the money for the books, when received, to the Friends that are correspondents in London, and to be diligent in spreading Friends' books for truth's service.

It is unanimously agreed and concluded, that this meeting be continued the next year, as formerly, at the usual time, as the Lord shall make way for it. And that, for the service of truth and the churches of Christ, two faithful understanding Friends in every county, who are truly approved in universal love, and unity, and peace among Friends, from whence they come, may be desired to come up, who may be enabled to give a certain and clear account of the condition and suffering of Friends, and truth's prosperity, in their respective counties.

And dear Friends and brethren; we do, in the love of God, tenderly recommend all the foregoing matters contained in this paper to your godly and Christian care, to observe and manage in his wisdom: as having an eye to the service and prosperity of truth, preservation of the people therein, and the peace of the churches of Christ, and increase of his kingdom and gov-

ernment in this age, and in the ages to come. The God of peace be with you all, in whose dear love we remain your faithful Friends and brethren.

It is desired that Friends keep the Yearly Meeting papers together in a book, in each Monthly and Quarterly Meeting.

Signed in behalf of said meeting, by
BENJAMIN BEALING.

An epistle of dear G. F.'s (which was written with his own hand, and left sealed up, with the superscription, viz., "Not to be opened before the time" was read and agreed to be printed with this Yearly Meeting paper.

The person transcribing these epistles, takes the liberty to draw the attention of the readers of *Friends' Intelligencer* to them, and more particularly to this one. In these epistles may be found embodied the views of our early Friends, and sent forth to the members of its constituent parts, and to others in various parts of the world, officially, and to me they are, at this epoch in the history of our Society, peculiarly interesting, setting forth as they do, the views of Friends, with regard to faith and practice, in what we fain would believe to be the best days of Society, when honesty, sincerity, love, brotherly condescension, and humility prevailed to an extent never since excelled.

And my prayer is, that we may emulate their example, in striving after a spirit of unity, that the waste places within our borders may yet be built up, and that we too may be enabled to say that "We are much comforted" "in the many good accounts given as heretofore of truth's prosperity, and the increase of Christ's kingdom, and the abounding love, peace and unity among Friends, and the decrease and dying of the spirit of division and enmity in divers places where it has entered." E.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FOURTH MONTH 2, 1859.

AMUSEMENTS.—The subject of amusements has particularly of latter time, occupied much attention among those to whom the welfare of the young is an object of interest.

We do not believe that the young people of the present day are more prone than they ever have been to seek after amusement and recreation, but, with the increase of wealth in our Society, luxury any refinement, so called, have followed, bringing in their train exciting, artificial and expensive amusements. It is not therefore, by waging war against any one or more of these indulgences, that we shall convince the understandings of the young, for some of these are clear sighted

enough to discover that we who reprove them are very far from observing true simplicity in all things; but, in the first place, by contenting ourselves with moderate acquisitions, which are the best barriers against the inroads of luxury and extravagance, and then by cultivating in our children a love for those simple, inexpensive and healthful recreations in which old and young might participate and be mutually benefitted.

It is vain to ignore that part of our nature which impels us to seek relaxation and recreation, and causes in the young a desire for amusement; it is in recognizing it as a part of the work of the great Architect,—a *want* of our nature for which we are bound to make proper provision, that we can alone hope to win the young from those amusements which are hurtful, and lead them to those which are innocent, simple and promotive of true enjoyment. We insert some extracts from an essay on this subject, which appeared in the *Monthly Religious Magazine*, which are interesting and pertinent.

We have been requested to say that an individual professing to be a member of the Society of Friends has been visiting some of our cities and neighborhoods under various assumed names and pretexts, representing himself as connected with families well known, and obtaining money by imposing on the sympathies of the unwary.

MARRIED, At Fall Creek Meeting, Ind., on the 17th of 2d mo., 1859, CHARLES HAINES, to MARY ROBERTS, daughter of the late Solomon W. and Elizabeth Roberts, both of Fall Creek.

—, At Drumore, Lancaster county, Pa., on the 2d ult., with the approbation of Little Britain Monthly Meeting, JOSEPH S. WALTON, of Fallowfield, Chester county, to PRISCILLA S. PARRY, of Drumore.

—, On 10th of 2d mo., 1859, according to the order of Friends, CALEB C. WAY, to SARAH WILSON, daughter of Thomas and Hannah Wilson, of Halfmoon, Centre county, Pa.

—, According to the order of Friends, on 5th day the 17th of 2d month last, at the house of her father, J. Burr Atkinson, ELMER DUELL, to HANNAH T. ATKINSON, both of Salem county, N. J.

—, According to the order of Friends, on 5th day the 3d ult., at the house of her father, Jonathan D. Smith, in Woodstown, N. J., ALFRED LIPPINCOTT, to MARY E. SMITH.

DIED, At his residence near Woodstown, N. J., on the 13th ult., JONATHAN CAWLEY, aged about 70, a very worthy citizen, and kind friend to the poor and needy. His remains were interred from the Friends' Meeting-house in Woodstown, at which were assembled a very large company, among whom were many of the colored people, who had long been recipients of his bounty, gathered to bid their friend a final farewell.

DIED, On the 17th of 9th mo., 1858, in Milford, Clermont county, Ohio, PHEBE JANE, daughter of Thomas and the late Phebe Jane Moore, aged 10 months and six days.

—, At his residence, near Rohrsburg, on the 6th of 3d month, 1859, ARNOLD KESTER, in the 36th year of his age; a member of Fishing Creek Monthly Meeting of Friends, held at Millville.

—, On the 15th of 2d mo. 1859, at the residence of his brother, Simeon M. Lewis, in Huntsville, Madison county, Ind., JOHN LEWIS, in the 48th year of his age.

—, At Fall Creek, Madison county, Ind., on the 10th ult., of croup, REBECCA, daughter of Lewis W. and Priscilla M. Thomas, in the 5th year of her age.

—, On the 10th ult., at her residence in Loudoun county, Virginia, MARY BIRDSALL, in the 66th year of her age. She was an elder of Goose Creek Monthly Meeting, and highly esteemed for her christian spirit and exemplary character. Having lived the life of the righteous, she died in the assurance of a blessed immortality.

—, On the 31st of 8th mo. 1858, MARY M., widow of Aaron Musgrave, in the 84th year of her age. She was interred on the following day in Friends' burying ground, at Millville, and her funeral was attended by a large number of friends and relatives, by whom she was particularly beloved. She was, and has been, from the time of its establishment, a member of Fishing Creek (formerly called Muncy) Monthly Meeting and at the time of her death was one of its oldest members. It might be truly said, she was a mother to all, for nothing seemed too much for her to do for the comfort and convenience of her friends.

EXTRACTS FROM AN ESSAY ON AMUSEMENT.

The lights and shadows that chase each other over the landscape are an emblem of the swift alternations and contrasts that pass over us in life. It would seem to be a part of the great plan and design of Providence, that we should be hurried from one extreme to another. Labor and rest, care and amusement, anxiety and relaxation, weeping and laughing, rapidly succeed one another, and altogether make up that order of emotions, employments, and events which the Divine wisdom has ordained for our advancement in this earliest stage of our existence. All are needed. All should enter into the various texture of life, to call out our latent energies, to afford full play to our powers of heart and mind, to enlarge our sympathies, to give elasticity and vigor to our thoughts, and blended strength and softness to our characters. It is as if, in passing through the different zones of the earth, we had the power of taking up into our own system whatever is most valuable in every climate, till in our ripened characters at last we combine the matured and perfected results of all these varied processes. To exclude from our range of thought and life any one department designed by Providence to enter into our experience, is to curtail our means of education, and to cramp the free exercise and development of our powers.

We propose in this article to speak of life, not in its solemn, but in some of its lighter aspects and employments. We are not made for serious

pursuits alone. Rest is as necessary as labor. And not only rest, but exhilaration, entertainment, amusement, is needed by those whose regular occupation tasks them to the utmost. The man whose mind is always bowed down by care and toil, must necessarily lose, to some extent, the elasticity of his mental faculties. * * * * Among most nations this necessity of our nature has been recognized, and the relaxation and entertainment required by it have been associated with their religious duties.

"The Hebrews," according to one of the ablest writers on Jewish Antiquities, "spent the Sabbath in rest, and in a decent cheerfulness, and did not deem it inconsistent with its sacredness to dance, sing songs, and play on instruments of music;" though the songs, dancing, and music were of a religious character, or expressive of religious emotions. The new moon was announced by the sound of trumpets, and was, more or less, according to the season of the year, regarded as a festival. There were three great national festivals appointed to be kept by all the Jews. The Feast of the Passover, in the spring, and the Feast of Tabernacles in the autumn, continued seven days each, and the Feast of Pentecost, seven weeks after the Passover, was intended to celebrate the first fruits of the harvest. While the idea of sacrifice and worship lay at the foundation of these three national observances, they were also marked, especially the Feast of Tabernacles, by every expression of festivity and gladness. Distant families met; new acquaintances were formed. * * * For with the Jews, religion was not set apart as a gloomy, repulsive thing; but its gladdening notes thrilled through their social and domestic enjoyments; it rung its glad strains amid the sports of the young, it welcomed the stranger, the widow, and the fatherless to its hospitable entertainments, and added a new charm to every form of social festivity.

Three times in the year the whole Jewish people were called upon to unite in these solemn and joyous festivals. When the seed had been sown, when the first fruits had been reaped, and when the whole harvest had been gathered in, they met together, young and old, master and servant, husband and wife and little ones, to celebrate the goodness of God, to rejoice in their national blessings, and to unite more strongly the bonds of social endearment. These religious gatherings, these festal songs and jubilant anthems of gratitude and praise, had their influence on the national character, and helped to keep alive a sense of God's infinite goodness to them. And when the national faith and character had been weakened by the inroads of luxury, and the voluptuous habits of foreign people, and the Jews had been carried away into captivity, nothing awakened in them such a longing to return to Jerusalem, and to the hills and pleasant haunts of their native soil, as the songs of Zion,

—those songs which they had sung, accompanied by harp and timbrel, at their great national festivals. So important were the provisions made by Moses for the festive part of man's nature.

We, from the peculiarity of our origin, have in a great measure been cut off from all such provisions. Our ancestors, in separating themselves first from the Church of Rome, and afterwards from the Church of England, were so persecuted and oppressed from one generation to another, that they came at last to look on every festal occasion and custom connected with those churches as an unclean and dangerous remnant of the old and accursed superstition. * * * In their religion we hardly recognize the Son of Man who came eating and drinking, and whose first miracle was wrought to "adorn and beautify" the marriage feast. They had a great work to accomplish. A nobler race of men was never employed by God in his providence to lay the foundations of a mighty empire, than those who first built their churches and school-houses on these Western shores. But they had been educated in too severe a school, and were bowed down by cares too constant and oppressive, to allow room for anything of a light or festive character. Hence amusements were more than half forbidden among them; and those which from the necessities of our human nature grew up with the young, and became almost established institutions, were for the most part ungracious and unlovely. The spirit which had lingered round the old holidays, and which had such a charm for poet and people, had been driven off. In pulling up the tares which the Evil One had sown, our fathers also pulled up many a sweet wild-flower which God had planted for the delight and comfort of his children. Gross and degrading indulgences crept in by stealth, to occupy the hours when the young could neither work nor sleep. Drinking was almost the only amusement that was allowed, and it found its way, to an alarming extent, into every class of society. Within the last thirty years, great efforts have been made to break up this pernicious habit, and not wholly without success. But innocent amusements must come in to take the place of old and dangerous indulgences, before the reform can be entirely successful. * * *

God is not to be worshipped only in sick chambers and at funerals, or served by us only when we are burdened with care or bowed down with a painful sense of accountability to him. If he lights up with his bow of promise every penitential tear-drop that flows, so does he wreath the smiles of his love around the countenances of those who rejoice in him. If he has made sorrow in the hearts of his children a sacred thing in the sight of his angels, so also do the angels themselves surround his throne, and celebrate his praise with songs of jubilee. He who formed the heart of the young child, with its frolicsome

outbursts of mirth, and then caused it to be placed before us as an emblem of his kingdom, does not frown upon it when it smiles, and smile upon it only when it grieves.

We mistake the genius of our religion altogether, when we confine it to the sombre side of life. It does, indeed, with Paul and Silas, uplift its clear and melodious song in the night; but it also gives new brightness to the day. Its Providential kindness gathers each little bird under its wings, as it sleeps beneath the shadows of evening; but it also pours itself around it in the light, and becomes the inspiration of its morning song. It strengthens the aged, and sheds its peace abroad in the souls of the dying; but it enters also into the hearts of the young and vigorous, throws its radiant hopes around them in their times of mirth and gladness, and gives new interest and beauty to their enjoyments. It could hardly be otherwise with a religion which ages before its advent to the earth filled the prophetic heart of holy men with visions of an unknown and unimagined joy, which came attended by the jubilant song of angels, and unfolded to the waiting souls of men the hope of a joy unspeakable and full of glory.

We must remember this in the provisions that we make for the good of society. The serious concerns of life are of course to be attended to first. But if the necessity for recreation which exists in our nature is shut out from the innocent amusements in which it might spend itself, the young will be tempted to break loose from the unnatural restraints, and to seek their pleasure in hidden vices or unbridled indulgences. If harmless amusements are forbidden, or even if no pains are taken to furnish them in order to make home lively and attractive, and to vary the routine of study and labor by some sort of pleasurable excitement and recreation, they will be driven to seek for themselves amusements which are not harmless, but which are likely to mislead and corrupt them.

It should be, therefore, a duty with all parents, to make home as attractive as possible to their children, and to furnish them with suitable amusements. It will be favorable alike to their intellectual and their moral vigor. Many a young man has been physically and intellectually broken down from the want of frequent and proper recreation; and many more have been driven into low and secret vices,—driven to the tipping and gambling room, and to the companionship of idle, dissolute, corrupting associates,—by the comfortless stupidity and dulness of their virtuous, and even religious homes.

In the first place, then, amusements ought to be as much as possible at home,—associated with home affections, pursuits, and habits. The happiest place in the world for young people, ought to be their own home. But unless some provision is made for amusement, as well as for la-

bor and instruction, it will be distasteful to them. They will be glad of an excuse to get away. The restraints of home will be felt to be unnatural and unreasonable, and soon they will be disregarded. Where there is the most unrelenting family discipline, there the young are most apt to deceive their parents, and to be led away into dangerous and ruinous excesses.

We would, therefore, entreat parents to make their homes as pleasant as possible to their children, to lay no hard restrictions on any innocent diversions, but rather seek them out, and help them on, and enter as much as possible into their spirit.

(To be continued.)

HISTORICAL SKETCHES AND REFLECTIONS.

BY S. M. JANNEY.

No. 3.

It being determined by Infinite Wisdom to bring a flood upon the earth to destroy its degenerate inhabitants, Noah, a just man, found favor with God, who instructed him to build an ark for the saving of himself and family. This great historical fact is not only related by Moses, but confirmed by the express language of Jesus Christ, as reported by two of the evangelists. It cannot, therefore, be denied without calling in question, their narrative, or the infallibility of that holy personage who spake as "never man spake."

Although this is sufficient authority to satisfy the devout believer in Christianity, there is other corroborative testimony which should not be overlooked. It is well known that among un-tutored nations where no records exist, the knowledge of by-gone events is preserved by tradition, and that some important transactions have in this way been transmitted through a long series of ages. By this method it is obvious that no accuracy of detail can be attained, but the general outlines of great events may be preserved with unmistakable distinctness. The extinction of nearly the whole human race by a flood is an occurrence that would make a strong impression on the few survivors, and accordingly it appears that traditions relating to it have been found almost co-extensive with the human family. In the travels and researches of Humbolt in South America, he writes as follows: "These ancient traditions of the human race which we find dispersed over the surface of the globe, like the fragments of a vast shipwreck, are of the greatest interest in the philosophical study of our species. Like certain families of plants which, notwithstanding the diversity of heights, retain the impress of a common type, the traditions respecting the primitive state of the globe present, among all nations, a resemblance that fills us with astonishment; so many different languages belonging to branches which appear to

have no connection with each other, transmit the same facts to us.

The substance of the traditions respecting the destroyed races and the renovations of nature, is everywhere almost the same, although each nation gives it a local coloring. In the great continents, as in the smallest islands of the Pacific ocean, it is always on the highest and nearest mountains that the remains of the human race were saved, and this event appears so much the more recent the more uncultivated the nations are, and the shorter the period since they have begun to acquire a knowledge of themselves. When we attentively examine the Mexican monuments anterior to the discovery of America, penetrate into the forests of Oronoco, and become aware of the smallness of the European establishments, their solitude and the state of the tribes which retain their independence, we cannot allow ourselves to attribute the agreement of these accounts to the influence of missionaries and to that of Christianity upon national traditions.*

Where the art of writing is known, tradition being no longer relied on, gradually fades away; but among the earliest writings extant at the beginning of the Christian era, some of which have since been lost, there were several authorities found to substantiate the fact, that a flood had swept off nearly the whole of the human family. Berosius, who lived during the Macedonian dynasty, compiled his Chaldean annals from the documents found at Babylon, after its conquest by Alexander. In these annals Chronas, one of their worshipped deities, is described as having appeared in a dream to the king Xisuthrus to apprise him that mankind would be destroyed by a flood; and commanding him to build a vessel to contain his relations, the necessary food and also birds and quadrupeds.† Josephus, in order to corroborate the Mosaic account of the flood, quotes from Berosius and other ancient authors, whose writings have since disappeared. ‡

The Greeks, the Persians, the Hindoos and the Chinese, had similar traditions recorded in their most ancient writings, which may be seen quoted in Turner's Sacred History, and Miller's Testimony of the Rocks. It appears from these testimonies, that there is all the evidence for a great Deluge that we can reasonably expect after the lapse of four thousand years; and it may be added, that some of the most eminent geologists agree in asserting that there is nothing in their science to invalidate the Mosaic record. The only plausible objection that has been raised relates to the universality of the flood. Bishop Stillingfleet (a contemporary of William Penn, who quotes from his writings) says in relation to

* Humbolt's Travels and Researches, Chapter 19.

† Turner's Sacred Hist., vol. 2, letter xvi.

‡ Antiquities, Book I. chap. 3.

the Deluge. "I cannot see any urgent necessity from the Scriptures to assert that the flood did spread over all the surface of the earth. That all mankind, those in the Ark excepted, were destroyed by it, is most certain, according to the Scriptures. The flood was universal as to mankind; but from thence follows no necessity at all of asserting the universality of it as to the globe of the earth, unless it be sufficiently proved that the whole earth was peopled before the flood, which I despair of ever seeing proved."*

It is remarked by Hugh Miller, that "It is well known to all students of the sacred writings, that there is a numerous class of passages in both the Old and New Testaments in which, by a sort of metonymy common in the East, a considerable part is spoken of as the whole, though in reality less than a moiety of the whole."

For example, it is said that on the day of Pentecost there were Jews assembled at Jerusalem "out of every nation under heaven," but further on, we read, that these Jews had come from "the countries around Judea, as far as Italy on the one hand, and the Persian Gulf on the other; an area large indeed, but scarce equal to one fiftieth part of the earth's surface."†

In like manner it is said that "all countries came into Egypt to Joseph to buy corn," and that the Queen of Sheba came from the uttermost parts of the earth. Even the expression that "all flesh had corrupted his way upon the earth," must be taken with some limitation, for there was an exception in the person of Noah, and perhaps others of his family who were saved. Taking into consideration that the object of the flood was to destroy the wicked, there is no reason to suppose that it extended further than the earth was inhabited, which may have been only a part of Asia.

If this view be accepted we must limit some of the expressions by which the flood is described in the 7th chapter of Genesis, as we are obliged to limit the other passages of Scripture that have just been quoted.

It is well known that the birds, beasts, and insects, indigenous to the several continents and islands, are generally of species entirely different from those found in other localities, which has led naturalists to conclude that there have been several centres or localities where the original pair, of each kind of animals, was created.

For instance, the birds, beasts and insects found in America and Australia, when first discovered by Europeans, were peculiar to those countries, and different from all that were known in Europe or Asia. This does not apply to human beings; for of man there is only one species, which must have proceeded from a single pair.

Now it is obvious, that the beasts of America

and Australia could not have reached the ark without a miracle that would seem to be superfluous, if there were no human inhabitants in those distant lands.

From these and other considerations, it has been concluded by many who have full faith in the authenticity of the Scriptures, that the flood only extended to that portion of Asia where the human race then resided, and that the animals taken into the ark, though numerous, were only those which existed in that locality. The ark, as described in Genesis, was of vast dimensions and capable of containing a very large number of animals with the food appropriate for them. These brief remarks on the credibility of the Mosaic narrative, and the collateral testimony by which it is supported, are intended to meet the objections sometimes made by inquiring minds; but it is not my design to cast a shadow of doubt on the miraculous power manifested in that overwhelming flood which drowned the rebellious multitude, while the righteous few were saved.

The next point for consideration is the means employed to cause the flood:

"Has not God
Still wrought by means since first he made the world,
And did he not of old employ his means
To drown it? What is his creation less
Than a capacious reservoir of means
Formed for his use and ready at his will?"

Not only were the "windows of heaven opened," so that rain fell in torrents, but "the fountains of the great deep were broken up;" from which it may be inferred, that the waves of the ocean rolled in upon the shore. In that part of Asia where the human family is supposed to have been created, there is a region of country watered by rivers which flow into the Caspian sea, and the sea of Aral.

The Caspian is a vast lake more than 700 miles long and about 200 wide.* It has no outlet, and its surface is computed to be more than 80 feet below the level of the Black sea, which communicates with the ocean.

In this region there are extensive districts still under the level of the ocean. "Were there a trench-like strip of country that communicated between the Caspian and the Gulf of Finland, to be depressed beneath the level of the latter sea, it would so open the fountains of the great deep as to lay under water an extensive and populous region containing the cities of Astracan and Astrabad, and many other towns and villages. Nor is it unworthy of remark, surely, that one of the depressed steppes of this peculiar region is known as the Low steppe of the Caucasus, and forms no inconsiderable portion of that great recognized centre of the human family. The Mount Ararat on which, according to many of our commentators, the ark rested, rises imme-

* Quoted in Testimony of the Rocks, p. 303.

† Ibid, 302.

* Malte Brun's Geography.

diately on the western edge of this great hollow. The Mount Ararat selected as the scene of that event, by Sir Walter Raleigh, certainly not without some show of reason, lies far within it."*

Such depressions of the land beneath the level of the sea, have often taken place. "On several of the coasts of Britain and Ireland the voyager can look down through the clear sea, in depths to which the tide never falls, on the remains of submerged forests; and it is a demonstrable fact that even during the present age there are certain extensive tracts of land which have sunk beneath the sea-level, while certain other extensive tracts have been elevated over it."

"In 1819 a wide expanse of country in the delta of the Indus, containing fully two thousand square miles of flat meadow, was converted by a sudden depression of the land, accompanied by an earthquake, into an inland sea; and the tower of a small fort, which occupied nearly the middle of the sunken area, and on which many of the inhabitants of a neighboring village succeeded in saving themselves, may still be seen raising its shattered head over the surface, the only object visible in a waste of waters of which the eye fails to determine the extent."†

All the dispensations of Divine Providence are doubtless the result of infinite wisdom and goodness. Some of them are too deep for the human mind to fathom, but the flood, as related by the inspired historian, contains an obvious lesson of instruction. I will consider it first in relation to those who were destroyed, and secondly in relation to the survivors and their posterity.

The wickedness of the human family had become so great, that the contagion of their licentious morals would almost inevitably have corrupted the rising generation. It was therefore a mercy to them to be taken from the evil to come. As to the adults, if any means could induce reflection and repentance, none was so likely to effect it as the flood. They had been warned of its coming by the preaching of Noah, but they scoffed at his exhortations, and went on in their evil courses until he entered into the ark.

Then the rains, as had been predicted, began to descend, the fountains of the great deep were broken up, and the waters of the ocean rolled upon the shore.

The valleys were first inundated, and then as the waters arose, the mountains became like islands in the vast expanse of rolling billows. During 40 days, while the waters were rising, we can readily conceive that the affrighted inhabitants fled to the mountains and sought for safety by ascending their loftiest peaks. Could they fail to become convinced that "There is a God who judgeth in the earth?" Would they not in this awful extremity seek his forgiveness by repentance?

When we consider that this life is but the beginning of man's existence, all events should be considered in relation to their influence on the eternal interests of the soul; therefore those events, which, in our view, appear most calamitous, may, in the ordering of Divine Providence, be the means, and the only means, of securing eternal felicity.

The last point to be considered is the effect produced on the eight survivors and their posterity. It not only saved them and their descendants from the corrupting influence of a wicked generation, but by a wonderful display of Divine Power, it must have made an indelible impression upon their hearts.

As the story of the flood has been handed down by tradition, in nearly all nations, and has been placed on record by the inspired penman, we cannot doubt that it has served as a warning to the wicked and an incentive to the good in each succeeding age.

ON SILENT WORSHIP.

O tell me not that man shall frame the law
By which my soul shall be allowed to draw
The stream of faith, of patience or of love,
Of charity or knowledge from above.
I ask no preacher to declare my need,
I pay no fellow-man my cause to plead,
I seek no organ, and I wish no choir
To sound to heaven my spirit's deep desire.
No, no! I claim the privilege as mine
To draw my life from Christ, the living vine.

O give me then an hour from care set free,
Unchained my thoughts—my mind at liberty,
Unawed by man—untrammelled by dull form,
My heart unbound—its feeble powers to warm
In the bright blaze of heaven's sacred fire,
Each moment my glad spirit mounting higher,
Until at length no barriers I meet,
But lay my weary soul at Jesus' feet;
O then, indeed, by storms no longer driven—
My spirit finds the calm repose of heaven.

Farmington, 16th of 3d mo. 1859.

THE LAW OF LOVE.

2 KINGS, 4: 3.

Pour forth the oil—pour boldly forth;
It will not fail, until
Thou fallest vessels to provide
Which it may largely fill.

Make channels for the streams of love,
Where they may broadly run;
And love has overflowing streams,
To fill them every one.

But if at any time we cease
Such channels to provide,
The very founts of love for us
Will soon be parched and dried.

For we must share, if we would keep
That blessing from above;
Ceasing to give, we cease to have;
Such is the law of love.—[R. C. TRENCH.

HEALTH IN PUBLIC SCHOOLS.

A friend has sent us for publication part of an editorial from the American and Gazette on the subject of health in the Public Schools. In the Normal School "the pupils are, we believe, from fifteen to eighteen years of age. A most critical period it is with the female constitution—the period which, of all others, makes its impress for life, both upon the mental and physical structure. The physical development, especially, is so decided and so rapid, that it demands the most sedulous watching. A single act of imprudence at that season has made many a female an invalid for life. Either the neglect of exercise or exercise carried to the point of exhaustion, is certain to exact its penalty. At no other period does the body stand so much upon its reserved rights, or resent with such vehemence any invasion of its prerogative. Whatever liberties may be taken with it before or after, in its early teens it will not be trifled with.

We should distrust, then, the expediency of a system, under which two or three hundred young women, at this turning point of life, were daily shut up in a schoolhouse for more than six consecutive hours. Allowing that they may occasionally pass from one room to another, and that the established routine may be marked by an agreeable variety of studies, still we do not see how it is possible to secure to them, under such a regimen, the amount of relaxation which they imperatively need. We are quite certain that we could not voluntarily place a child of our own under a discipline so rigorous. And in this suggestion the controllers and directors of our public schools may find an equitable rule by which their arrangements, as to this point, can be tested. Let them bring the matter home, and decide whether their plans are, in all respects, such as would meet their approval where their own children were concerned.

We touch, here, upon one of the most interesting aspects of the whole question. Our public schools are not under the control of the families which make use of them. The public governs them by such ministers and agents as it sees fit to appoint. The public—which to all intents and purposes is the board of controllers—is the trustee of every parent who has a child in one of these schools. There is no other board of management in our city charged with a trust more sacred or of higher responsibility than this. We are all interested in the faithful administration of it. Having adopted a system of public instruction which replaces parental oversight with that of officers appointed by ourselves, we are bound alike by the ties of humanity and by the common duties of citizenship, to see that the sixty thousand children confided to our care are receiving the best education, in all respects, which it is in our power to give them.

That the boards of controllers and directors

have, in the main, performed their arduous work in a manner which entitles them to the gratitude of the community, is one of the few points upon which the suffrages of the city will be generally united. But it is not incompatible with this conviction to suggest that there is one particular in which our system needs a thorough revision. We have long been of the opinion that too little regard was paid, especially in the female schools, to physical education. Young girls are kept too long in school. They have not sufficient opportunity for pastime and exercise. The well-being of the body is sacrificed to a lofty standard of intellectual attainment, and a perfection of discipline which rivals that of a crack military company. For ourselves, we like to see an orderly school, and we can admire the proficiency of young females who run up their term averages to ninety-nine and a fraction. But we have not lost our relish for the rosy cheeks and buoyant step and generous mirth of childhood. We cannot bear to see girls who are just opening into womanhood, with pale, anxious faces, and precarious steps, hurrying by from six mortal hours of study at school to four or five mortal hours more of study at home. We do not believe that a beneficent Creator ever designed that these patient, conscientious, dutiful children, should have all the joy of life crushed out in this style—that their youth should be spent upon the dreary treadmill of incessant study—and that when the real work of life is to be commenced, they should come to it with a disordered spine and shattered nerves, which turn to naught their lauded scholarship, and make the boasted education which was to have sustained and cheered them, a miserable drag-chain for the rest of their days.

We repeat it, this whole department of our public school system needs to be revised. We rejoice that the attention of the Board of Controllers has been called to the subject. And we trust it may receive due notice from some of our prominent citizens, who have no special connection with the public schools. There are professional men among us who could, by their counsel, render efficient service in removing the defects of our present system, and maturing it to that point of excellence which we are accustomed so complacently to challenge for it."

BINOCULAR VISION.

Of the thousands who gaze with delight upon the magical effects produced by that small instrument known as the stereoscope, how few there are who comprehend, or attempt to assign reasons for, the extraordinary optical illusions experienced through its instrumentality.

It will, in the first place, be well to consider the difference between monocular and binocular vision. Nature has furnished us with several means of determining the distance of objects which may happen to come within reach of our

visual organs. One is that of distinctness; a greater or less degree of which, other things being equal, gives an idea of greater or less distance in the object viewed. The second is through the change of focus required in the lens of the eye in refracting to a point on the retina, rays of light entering it with a greater or less degree of parallelism, thus producing in the brain a consciousness of unequal distances in the objects from which they emanate.

The means above alluded to, it is evident, are enjoyed in almost the same degree when viewing with one eye as where both are used.

By far, however, the greatest power with which nature has endowed us of discriminating distances, is through the agency of binocular vision; or in other words, in the sensation produced in the brain by the different degrees of converging of the optic axes required in obtaining distinct vision of the differently distant points of objects upon which they are directed. It is to this faculty that we are indebted for our most palpable evidence of differential distances, and for that consciousness of solidity and relief so remarkably experienced in the stereoscope.

It is evident, for example, when we are looking at a house or other object that has depth as well as breadth, from such a point of view as to enable us to see two sides of it at once, that we receive a differently perspective image upon the retina of either eye, or that we must see more of one side and less of the other, with the right eye than with the left, or vice versa. Thus accomplishing with one view what a person with but one eye would require two views at positions $2\frac{1}{2}$ inches apart—the distance between the eyes—to accomplish. These are the differently perspective views of the stereoscopic cards, and it is the effort to reconcile these dissimilar pictures by converging the optic axes at points differently distant from the eyes which produces the wonderful effect above alluded to, and which enables us to experience all the sensations of delight which would be produced by the contemplation of the landscape itself.

The stereoscopic pictures will never, of course, quite correspond. They are taken simultaneously with a camera constructed with two lenses, or consecutively with a camera with one moveable lens.

The lenses of the stereoscope, besides magnifying the pictures, are so placed as to unite certain similar points of them, thus relieving the eyes of too great effort in uniting them entirely by convergency of the apex.—*Jour. Franklin Institute.*

TOBACCO.

"In the United States, physicians have estimated that 20,000 persons die every year from the use of tobacco. In Germany, the physicians

have estimated, that of all the deaths which occur between the ages of 18 and 26, one half originate in the waste of the constitution by smoking. They say that the article exhausts and deranges the nervous powers, and produce a long train of nervous diseases to which the stomach is liable, and especially those forms that go under the name of dyspepsia. It also exerts a disastrous influence on the mind."—*Friends' Intelligencer*, 1855.

In 1840, there were 1,500,000 persons employed in the culture of tobacco.

In 1840, the consumption of the article in the States was \$20,000,000, which would make in 1852 by a population of 17,000,000, not less than \$30,000,000 annually.

Tobacco, according to analysis made by several chemists, contains at least two active principles, an acrid alkaloid and an essential oil. The alkaloid is said to act on the heart, destroying the action; the oil acts on the brain producing coma and convulsions. Under ordinary circumstances smoking is considered the most hurtful. If the oil from a cigar was swallowed, it would cause death immediately.—*Friends' Review*, [years ago.]

It is said there is more money expended in the United States for Tobacco, than for education.

ITEMS OF NEWS.

CHINA.—The China correspondent of the Philadelphia *Ledger* says: "Thirteen vessels have left China for Nagasaki within the last two months, and strong indications exist of a very fair trade springing up. One of the vessels (the American ship *Florence*, Capt. De Merrick, the first modern trading vessel visiting Japan,) obtained at once a cargo of ten thousand piculs of vegetable wax (about 1,320,000 lbs.) which cost but \$7 the picul, and which sells in Europe at from \$18 to \$20. Here is a clear gain of about \$120,000—a very fair balance for one ship, while hundreds of others are lying idle east and west, ruining their owners and affording food for worms.

TELEGRAPH.—*Toronto*, 3d mo. 24.—A bill has been introduced in the Assembly to incorporate the trans-Atlantic Telegraph Company. It provides for a line from Quebec via Labrador, with a capital of a million, with the privilege of increasing it to five millions—the line to be commenced within one year, and completed to Labrador within three years.

THE ANNUAL COST of the ministrations of the Church of England, to the people of London, is represented as a fraction over twelve dollars to each man, woman and child that attends them.

SUFFRAGE.—In the New York House of Assembly, last week, a resolution in favor of amending the Constitution, so as to extend free suffrage to colored persons, was adopted by the very decisive vote of 83 to 21.

THE OHIO RIVER is rising so rapidly that a flood is feared.

MARIA MITCHELL, the astronomer, is preparing to establish an observatory at a suitable position within the limits of Nantucket, her native town.

EMIGRATION.—From the weekly report to the Commissioners of Emigration, it appears that 5,103 emigrants arrived at New York since the first of the year.

THE MOVEMENT FOR THE BENEFIT OF SEWING WOMEN.—A meeting of the employers of seamstresses was held one evening last week, in New York. There was a very slim attendance, but the Secretary of the Industrial Association, who called the meeting announced that nearly all the leading employers of the City, comprising over 100 names, had been visited, and they all, without exception, expressed their approval of the plan, heretofore published in the *Times*, for improving the condition of the sewing women, and promised to furnish the Association with work. He further stated that nearly all of the manufacturers of sewing machines in the City had generously presented the Association with one of their machines, and that they would be ready to receive work from the employers. The following resolution was adopted, after which the meeting adjourned.

Resolved, That, in the judgment of this meeting, the plan proposed by the American Industrial Association for improving the condition of sewing-women is practicable, and if properly carried out will effect much good; and that this meeting pledges its cordial co-operation.—*N. Y. Times*.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is dull, without change in prices. We quote sales of superfine Flour at \$6 37 per bbl., and \$6 44 a 6 62 for extra family. The sales to the retailers and bakers are within the range of the same figures, and fancy lots at from \$6 75 to 7 75. Sales of Rye Flour and Corn Meal continue limited. The former at \$4 37. Corn Meal is held at \$3 87.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 56 a 1 60 per bushel for fair and prime red, and \$1 70 a 1 85 for prime white. Rye is less active and sells at 96 a 97c. Corn is in demand; sales of yellow at 88 a 89 cts. Oats are steady; sales of prime Pennsylvania at 55 cts., and Delaware and Jersey at 54 cts.

CLOVERSEED is inactive at from \$5 25 to 6 00 per 64 pounds. Timothy commands \$2 25 a 2 37 per bushel, and Flaxseed at \$1 70 a 1 75.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next session of this Institution, on the 2d of 5th mo. next. For reference and further particulars, enquire for circulars of Principal,
BENJAMIN SWAYNE.

London Grove, 22d of 3d mo., 1859.

CHATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON, } Assistants.

MAGGIE B. JACKSON, }
Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER, } Proprietors.

SUSANNA G. CHANDLER, }
3d mo. 19, 1859.—10 t.

ELDRIDGE'S HILL BOARDING SCHOOL FOR THE EDUCATION OF YOUTH OF BOTH SEXES.—All the branches of a liberal English Education

are thoroughly taught in this Institution. Also the French and Latin languages.

The summer session will open on the 3d of 5th mo., 1859, and continue 20 weeks, terms \$70 per session.

For full particulars address the Principal for a circular.

ALLEN FLITCRAFT,
Eldridge's Hill, Salem County N. J.

2 mo.

BOARDING SCHOOL FOR GIRLS, WEST CHESTER, PA.—In this institution, an opportunity is afforded of pursuing any of the various branches of science usually taught in the schools, and it is the constant object of the Principal, so to blend instruction that while giving clear and practical knowledge of those branches, the mental and moral culture may keep pace with the acquisition of literature and science.

The domestic arrangements are as nearly as possible those of a private family, and especial care is taken to provide for healthful exercise in the fresh air.

Pupils should be provided with their own towels, soap, clothes-bags, over-shoes and umbrellas, and clothing should be distinctly marked.

The school year consists of ten months, commencing on the first 2d day in 9th month.

TERMS.—\$150 per year, payable quarterly in advance. The Languages, Drawing and Coloring, extra. Books furnished on rent or at the usual retail prices.

E. W. RICHARDS, Principal.

West Chester, 2nd mo. 8th, 1859.

ATTLEBOROUGH ACADEMY FOR RENT.—The present occupant, Sidney Averill, being about to remove to his farm in the State of New York, the Building and premises are for rent, situated in a healthy neighborhood, and thickly settled; the opening for a boarding and day school, with a competent Teacher, is seldom surpassed, as the experience of the present Teacher will show. His school, for three past years, averaging boarders and day scholars, 120.—Rent moderate. Apply to either of the owners of said Building, living in Attleborough, Bucks Co., Pa.

ISAAC LIVEZEY,
JAMES FLOWERS,

JOSHUA RICHARDSON,
M. W. ALLEN.

Attleborough, 2nd mo. 14th, 1859.

ORANGE GREEN BOARDING SCHOOL FOR GIRLS.—The Summer Term will commence on the 11th of 4th month next. The location is unusually healthy and pleasant; the course of study extensive and thorough. Terms Thirty-six Dollars per session of thirteen weeks.

For particulars, address Principals,

SIDNEY PUSEY, OF
FANNY A. KINSEY.

Kennett Square, Chester Co., Penna.

2d mo., 1859.—2m.

BYBERRY BOARDING SCHOOL FOR GIRLS.—The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 21st of 2d mo. 1859, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

TERMS.—\$60 per session, one half payable in advance.

For Circulars containing further particulars, address
JANE HILLBORN,
1st mo. 22d, 2m Byberry P. O., Philada., Pa.

Merrihew & Thompson, Prs. Lodge street, north side Penna. Bank

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FOURTH MONTH 9, 1859.

No. 4.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A Testimony from Yonge Street Monthly Meeting, in the Province of Upper Canada, concerning JOB HUGHES, deceased, (late of Pennsylvania.)

We believe it our duty to commemorate the memory of this our beloved friend, who removed with his family to this Province, and settled at Yonge street in the 6th month, 1805. During his stay here he was a diligent attender of our religious meetings, both for worship and discipline, wherein he was careful to wait for and experience the arisings of truth, whereby he frequently became qualified, though not in the enticing words of man's wisdom, but in the demonstration of the spirit and of power, to unfold the hidden mysteries of Christ's kingdom, to the edification and encouragement of many present, at which times he was generally favored with a clear delivery, though at other times he was somewhat impeded in his speech. He was eminently serviceable in meetings for discipline, and labored much therein; although he was very zealous against obstinate offenders, yet to those under affliction his words were as healing balsam. A few months previous to his decease, he visited the different Monthly Meetings in this province, wherein he opened his prospect of our being united to one Yearly Meeting, and of requesting the privilege of holding a Quarter, which was unitedly concurred with. In the first month, 1807, he was one appointed to attend the Yearly Meeting therewith.

A few days previous to his journey, he spoke to some friends nearly in these words: "I have been favored to see the way on my journey, as clear and as bright as noonday, so far as my friend Reuben Lundy's, at Fishing Creek, but farther than there all appears to me dark as

midnight. Notwithstanding, I believe it right for me to go, and my desire is, that Friends may stand faithful for the cause and testimony of truth in this place, for it seems to me as if I have now about done with Yonge street." On the 24th of 3d month, he took a solemn leave of his family, as one never more to return, and by accounts he arrived at the aforesaid Friend's house the 11th of 4th month, very much indisposed, though he was seldom heard to complain of any pain, but expressed entire resignation to the divine will, and gave charge to avoid anything superfluous in regard to his interment. In this resigned frame of mind he quietly departed, without sigh or groan, the 26th of 4th month, 1807, and was decently interred in Friends' burying ground at Fishing Creek, the 28th of the same, aged 66 years. Signed in and on behalf of Yonge street Monthly Meeting, held the 18th day of Second month, 1808, by

AMOS ARMITAGE, }
PHEBE WINN, } Clerks.

A remarkable instance of Divine preservation from the hands of an intended assassin.

Although more than half a century has passed away since the event of which I am about to write transpired, it may not be out of season to commemorate the loving kindness of Him who sleepeth not by day nor slumbereth by night in watching over and protecting his truly depending children, who put their whole trust in his all-powerful arm; as it may prove encouraging to others in similar circumstances, to trust in Him who not only preserved Daniel in the lion's den, and the three holy children in the fiery furnace, but will still continue to protect and preserve his faithful servants, as his power is the same yesterday, to-day and forever. Many years ago there lived in Pennsylvania, in the county of Northumberland, in Roaring Creek Valley, a Friend by the name of Job Hughes, an approved minister of Catawissa Monthly Meeting. This Friend, on going out to his fields one morning, discovered that his horses had escaped therefrom, and having purchased one of them a short time previous, from some distance, he supposed the creature had endeavored to reach its former home. He immediately set out in pursuit, hoping to overtake them soon; but contrary to his expectations, he travelled many

miles before he found them. On his return he called next day at an Inn, to refresh himself and horses, where he observed a stranger whose appearance caused him to feel somewhat suspicious that his intentions were not good. After the refreshments were taken and Job was about to start, he requested the landlord to wait for his pay until he came that way again, it being a road he frequently travelled, as he came from home unexpectedly and had no money with him. About this time the stranger put on his hunting accoutrements, saying he would go out and try to find a deer; at which Job felt some uneasiness, as he started on the same road he was going. As he rode along, the stranger walked with him, sometimes by the side of the horse and sometimes behind, often changing from one to the other. These actions helped to excite Job's fears, as he said, when the man was by his side, he thought he intended to strike him from the horse with his tomahawk, and when he walked behind him that it was his intention to shoot him; but he endeavored to keep his mind quiet, looking to Him for protection who is able to say, "Thus far shalt thou go and no farther." After travelling in this way nearly two miles, the hunter said he would go into the wood and try to get a deer. As soon as he was out of sight, the Friend feeling at liberty rode on quite fast for two or three miles, when all fear left him, and he saw no more of the stranger. When he arrived at home he told his wife the circumstance, remarking that he had no doubt but that man would take the life of some person, as he believed he had such designs in his heart. This proved to be true, for not far from the same place the next day he took the life of a pedlar, and the rumor being spread of the missing man, suspicion rested on the stranger and the aforesaid landlord, and they were both arrested and imprisoned. When brought to trial the hunter confessed his guilt, and was condemned and sentenced to be executed; but previous to his execution he made a full confession of how he had executed his cruel design, and how he was tempted the day before to take the life of an old Quaker, he knew not what for, as he was aware he had no money with him, for he heard him request the landlord to wait until he came that way again. Still he was tempted to murder him, and started with him intending to execute his design, and walked by his side with the intention of striking him off the horse; but when he looked in his face, his heart failed him. Then he thought to walk behind him and shoot him, which he vainly endeavored to perform. After changing his position several times, his courage failing, he be-thought himself that he might run across the woods and get ahead of him, as there was a turn in the road, and shoot him from behind a tree; accordingly he left the road for that purpose, and ran some distance, when suddenly he be-

came very tired, and coming up to a large log he attempted to climb over it, but could not; his strength was nearly all gone, and he sat down and shed many tears, but knew not the cause. It was some time before he sufficiently recovered his strength to leave the place, and on the next day he committed the awful deed, for which according to the laws of the country he suffered death.

This is written from the memory of a surviving daughter of Job Hughes, who well remembers her father's bringing home with him a printed copy of the murderer's confession. Calling his family together, he read it to them, after which he, for the first time, rehearsed to his children the imminent danger their father had been in, and by what power he was preserved, his eyes overflowing with tears at the recollection, in gratitude to Him whose powerful arm had kept back the blow of the assassin.

ELEANOR BOWERMAN.

Often the water that is enclosed in a glass vessel appears to the unaided eye clear and pure. But if a ray of bright light suddenly strikes the vessel and illuminates it, we at once discover impurities which had before escaped our notice. So our sins have many hiding places, which conceal them from the natural conscience. And we should ask light from God, a clear, heavenly illumination, that we may find them out.

AMUSEMENTS.

(Concluded from page 43.)

To the young we would say, find your amusement as much as possible at home, or in the vicinity of home. Pleasant games in which you may be joined by your neighbors, in-door and out-of-door sports and exercises, the reading aloud of entertaining books, habits of pleasant and amusing, conversation, are among the ways in which "idle time may be not idly spent."

It is very important that amusements, both domestic and social, should not be expensive. The toys of a child gain nothing in value from being costly. Pleasure is cheap in childhood, and the least expensive pleasures are usually the most healthful to body and soul. It is a poor entertainment which depends more on the costliness of food and furniture, than on the intelligence and spirits of those who are to enjoy it.

We should cultivate a taste for what is beautiful. And here, for the poorest child that walks beneath the heavens, God has provided resources of enjoyment beyond all that wealth can buy. No galleries of art can compare with what the earth and sky offer almost every day and night in the year, if only the eye is taught to see and the heart to feel * * * * *

Our amusements should, as far as practicable, be such as tend to the cultivation of refined and

generous tastes, and social dispositions and habits. * * * * *

The use of intoxicating drinks, a merely sensual gratification, is a habit which has nothing but the temporary enjoyment or excitement to recommend it, while it may not only betray the young into occasional excesses, but lead them into the most perilous and fatal courses. It is well, therefore, that they should deny themselves this dangerous indulgence. We say *dangerous indulgence*, for it always is a dangerous indulgence to young men. Where they are in the habit of meeting by themselves with tempting and exciting drinks before them, there is hardly one in ten who will not sometimes do that which he will remember with mortification and regret. Let every one then, beware of entering upon a course which has deluded so many young persons of the noblest promise, and led them on, step by step, till the fairest hopes of life were blasted. You do not think that there will be any danger for *you*. This very security increases the peril. If you saw the danger, you might be on your guard. But in these matters more than in any other you will find the truth of the remark of a great and wise man, Dr. Johnson, who confessed that his only security from intoxication was found in total abstinence. "The diminutive chains of habit," he said, "are scarcely ever heavy enough to be felt, till they are too strong to be broken."

This is no place for details. But a few words may perhaps be added which look to something directly practical. There ought to be in every neighborhood, especially during the season of long evenings, simple, inexpensive gatherings of young people. Whatever enlarges their sphere of innocent enjoyment without interfering with their serious pursuits, is to be regarded as a benefaction to society. * * * * *

As a general rule, small gatherings are more favorable than large to health and enjoyment, and in a country town especially early hours are almost essential to success.

We greatly distrust in their influence on young men all convivial entertainments from which the other sex is excluded. The presence of refined and cultivated women is a humanizing restraint, and lessens every temptation to excess. Persons of both sexes and of all ages should be brought together. The graceful mingling of all, with the habits of mutual self-respect and virtuous reserve which the social instincts of their nature teach under such circumstances, tends to produce dignity and ease of deportment, true and noble aims in life, gentle and humane sentiments, while it prompts to the refined courtesies which throw their self-forgetting kindness into all the little acts that go to make up the delights of social intercourse.

As to the form that amusements are to take, the two leading remarks which we would leave

on the minds of our readers are, that they should be mostly of a home character, and that, in order to be general in their influence through a neighborhood, they should not be too elaborate or expensive. * * * * *

With respect to all of them it is well for us to remember, that, if they make our home pleasures tame or distasteful to us, if they make our daily occupations uninteresting or burdensome, if they encroach on our more serious duties, if they tend to cherish in us habits of idle reverie, withdrawing our thoughts too much from the actual pursuits and interests of life, if they make virtue in any way less lovely or religion and its observances less attractive, then they cease to be innocent, and we should be on our guard against them. So if they are of such a character that we dare not look up from the midst of them to ask the favor and the blessing of God upon us, we should separate ourselves from them. For that which he refuses to bless cannot be otherwise than unblessed to us.

One further remark we wish to make. It must never be forgotten that amusements are intended only for relaxation,—a state between working and sleeping, to ventilate our faculties and recruit them for new efforts in the great work of life. Viewed in this light, they are beautiful interludes, provided by Him who knoweth our frames, and gracefully thrown in, like sunny openings in the forest, amid our serious occupations and cares. * * * * *

Here we see the true place and office of amusements. They are not the business of life, but interludes, recreations, refreshments, thrown in at intervals to save us from being utterly broken down by unceasing and perpetual toil. While we study or labor, while we do our part to work or to prepare ourselves for work, we have a right, nay, it is our duty, as well as our privilege, to give ourselves up from time to time to amusements. But when amusements become the chief thing, when they take the place of the serious duties which God has imposed on every man whom he has created, then they undermine our principles, and impair our faith in whatever is noblest in virtue, or most holy in religion. The soul which lays upon itself no weightier obligations and seeks no higher ends, is lost. Even poetry and art, so beautiful in their place as the handmaids of religion, only lead us into the paths of death when they withdraw from her guidance and demand for themselves the worship which is due to God alone. "This, too, is the ruinous effect of an education of accomplishments. The education of the taste, and the cultivation of the feelings, in undue proportion, destroy the masculine tone of mind. An education chiefly romantic or poetical, not balanced by hard practical life, is simply the ruin of the soul."*

*Robertson.

And when such has become the character of a community, when æsthetic tastes have greater influence than the love of truth, and amusements are allowed to stand in the place of better things, then, no matter what external show of prosperity or refinement there may be, the doom of that community is sealed. "For," in the language of an able historian,* "neither in sacred nor profane history,—neither in the monarchies of the East, nor the free commonwealths of the Western world,—neither in Egyptian, Grecian, Roman, Italian, Saracenic, or any other chronicles,—could an exception be found to the law which dooms to ruin any people who, abandoning the duties for the delights of this transitory state, live only in the frivolities of life, and find only the means of a dissolute and emasculate self-indulgence in God's best gifts to man,—in wealth and leisure and society, in erudition and art and science, in literature and philosophy and eloquence, in the domestic affections which should bless our existence, and in the worship by which it should be consecrated."

EXTRACT.

"It is a most significant fact that the universal consciousness has taken up into itself the meaning of nature, for all human language represents the operations of the mind, good and bad, by things good and bad in the world without. Into nature all language sends down its roots and draws up its life, to depict the hideousness of sin or the sweetness and beauty of virtue. There is hardly a word in any language that describes a mental process or a heart process which, traced to its root, is not found to conceal an image drawn up from the natural world to reflect the beauty or deformity of the soul; and however the sentimentalists would have it, the soul intuitively reads its subjective heaven or hell in the face of nature, 'clear as in a molten mirror.'

The very words we are using illustrate the point, for heaven is the participle of the verb *to heave*, and means something raised or arched above, and by analogy the soul's serene height, above the perturbations and storms beneath; and hell in the Hebrew was a loathsome valley, where rose the fetid smoke of human sacrifice, and hence the soul's cavernous deeps where humanity is sacrificed in its lustful fires."

We may lay it down as a principle in the religious life, that everything is wrong in regard to which we cannot ask the Divine direction and blessing. When we sin, we wish, like our first parents, to hide ourselves from Him whom we have offended. But it is the nature of a pure heart always to seek God. Its language is, in all the occurrences and duties of life, "My Father, what wilt *thou* have me to do?"

*Sir James Stephen.

My heart was hot within me; while I was musing, the fire burned."—PSALM xxxix. 3.

There is a strongly marked contrast between different classes of those exposed to intense cold. In not a few of our narrow streets and rickety houses you may find poverty-stricken families, hovering with contracted limbs, and chattering teeth over scanty fires, while their dwellings seem a mere lattice-work, designed for the free passage of the northern blast; and probably there is no suffering from the cold that is keener than might be witnessed, not far from any of our homes, on a severe winter. But with the thermometer at its lowest range, the axe of the woodman plies with a vigorous and merry ring; the farmer trudges, unchilled, in the snow by the side of his team; and warm, glad life far outspeeds the wind it braves in the swift sleighs that track our interior river-courses and lake-beds.

Whence this contrast? The cause is, manifestly, internal, not external,—personal, not atmospheric. We are heated, chiefly, not from without, but from within,—not by the fuel burned in our presence, but by the fuel which we ourselves consume. We carry about within us our own hearth with its undying fire,—our own stove with its perennial radiation of heat. Our lungs are the seat of a perpetual combustion; of a coal-fire kindled with our first breath, extinguished only with the last. The fuel is the carbon and hydrogen contained in our food, which are carried, in combination with other elements, through the processes of digestion and blood-making, conveyed to the lungs, and there oxidized, or, in other words, ignited and burned by the oxygen inhaled from the atmosphere. This combustion it is which heats the body; while the circulation which it demands and sustains enables the human system to resist to a wonderful, and in some cases a seemingly miraculous degree, the effect of external heat. In extreme cold, no particle of blood remains near the surface for more than an instant; but the entire life-tide circulates constantly to and from the central hearth, thus sending to the surface, from moment to moment, a freshly heated current. On the other hand, in external heat higher than the average temperature of the body, the constant withdrawal of blood from the surface before it has time to become unduly heated, preserves the internal temperature unchanged. Thus, for a range of more than three hundred degrees of external heat, there is a variation of not more than three or four degrees in the healthy human body.

Now the contrast between the suffering and the unsuffering in the severe exposures of our Northern climate is due to the different amount of fuel employed to feed this internal flame. Fire, it is often said, cannot warm the very poor. The reason of this is that their meagre vegetable food, even if it seem unstinted in quantity, is deficient in those unctuous, carbon-making in-

redients which sustain the fires within. What they need, even more than replenished wood-piles, is a generous diet. On the other hand, those who can meet the bleakest exposures without suffering, are well fed on carbon-yielding viands, and the fire that they carry within them never burns low for lack of fuel.

This self-heating apparatus is well worthy of our study, as one of the most recondite and marvellous arrangements of the Divine wisdom in the economy of animal being,—or, I should rather say, of human being; for in man alone does it attain its perfect adjustment. Other animals are limited in climate, and their constitutions are adapted to their appointed limits. Man, the destined denizen of every zone, can subsist alike on tropical sand-wastes and beneath a roof of Arctic ice.

The perfect working and cosmopolitan adaptation of this apparatus have been most strikingly illustrated in the experience of Dr. Kane and his companions. With a temperature sometimes of seventy degrees below zero, for weeks together below the freezing-point of quicksilver,—often burrowing in the snow at these low temperatures,—they found themselves dependent on food rather than on fire. With an adequate supply of walrus-flesh and other carbon-yielding food,—the natural and fitting nourishment for those high latitudes,—they enjoyed health, comfort, vigor, gayety, hopefulness. When this supply fell short, the red-hot cabin stove seemed to yield no warmth; chilled nature drooped, sickened, and was ready to perish,—reviving again, and burning with its accustomed fires, when a kind Providence again spread their board in accordance with their needs.

I have dwelt thus long on this portion of human physiology, not alone with reference to what I have yet to say, but for its own sake,—as furnishing thoughts which, with our wintry winds, and in the rich comfort of our sheltered and affluent homes, may give added definiteness and a higher glow to our ascription,—“I will praise thee; for I am fearfully and wonderfully made.”

Our text suggests a similar economy in the spiritual organism. What a contrast is there between different classes of exposed, tempted, imperilled, afflicted souls! Some seem at the mercy of every external blast of evil or misfortune. Their principle shrinks into itself on the first access of temptation. Their courage yields to every petty trial. Their serenity can stand no shock. They are utterly unfortified against assault, whether from an adverse moral force or from an afflictive providence. Pierced through and through by every wind, chilled to the soul's centre by every privation, stripped to wintry desolation by the inevitable calamities of life, they awaken in one who is a discernor of spirits very much the same kind of shuddering-sympathy which is aroused in the heart of the win-

ter visitor of the poor. There are others, who are always bright and warm, serene and happy. Every blast of adverse fortune may sweep around them and over them without chilling them. All things may seem against them; yet in all and over all, alert and joyous, they show that their happiness has its cause as well as its seat within,—that there are in them self-sustaining and self-feeding resources adequate to their intensest need.

We find such persons even in the arctic regions of human experience. We have known those who for many years have had not so much as a single unsuffering night or painless hour, who yet showed no symptom of inward unrest, whose countenances always betokened tranquillity and gladness, whose lips never opened for complaint, but constantly for gratitude and trust. Among the most serenely happy of our acquaintance have been some who have been bereaved at every point,—who, were it not for the attractive power of their Christian excellence, would stand almost alone in a stranger-world,—yet over whose hearts has passed no touch of cold, over their sympathies no blighting, over their affections no wintry frost. Not that they did not love the departed tenderly; but there is a vitality within them which resists every depressing influence from without,—a full, warm current of spiritual life, which circulates so fast, and throbs with so strong a pulse, that it cannot be chilled. There have been also those, who, in the service of God and man, have encountered every conceivable form of adversity, hardship, privation, and persecution, who yet, morally and spiritually, have held their own and more, not in faith and steadfastness alone, but in peace and joy,—who have felt as the Burman missionary did, when, wasted with consumption, he was borne through pathless jungle and over swollen streams, to preside at the baptism of a little company of converts from idolatry, and, dying on the field of his bloodless victory, seemed lifted to the third heaven of ecstatic joy, with no regret but that he had not more lives than one to wear out in his exhausting toil.

How beautiful an example of this self-sustaining warmth of life and happiness is St. Paul in his hunted, outcast pilgrimage, in frequent stripes and imprisonments, hardships and perils, sometimes for many consecutive months chained by each hand to a Roman soldier, yet so joyous in soul that the best wish he can breathe is, that one might be as he was, “except these bonds.” Hear him, when in the grasp of the terrible Nero, and with no prospect so probable as that of being thrown, the next week or day, to be the food of savage beasts, over and over again calling upon his Philippian friends to joy and rejoice with him. See him, in this fearful crisis, inditing that letter, in which it seems as if words could not flow fast and strong enough to give expression to the grateful gladness that fills his heart.

Now here is a spiritual contrast closely analogous to that which I cited of varying bodily experiences in this climacteric of our winter. The two cases are also analogous in their physiology. There is in every scul a central hearth, a self-heating apparatus, a self-gladdening faculty, an innate power of rejoicing for evermore. But it is not a power which works without feeding. It demands nutriment. It craves fuel. It desires meat to eat that the world knows not of,—such as nourished Jesus when he refused the food that the disciples brought him,—in the beautiful figure of the old hymn,

“Such as the saints in glory love,
And such as angels eat.”

This fuel is not given, this fuel-yielding food is not supplied, even by the happiest experiences of the outward life, which, like the fire in our houses, warm only the surface, penetrate not the recesses of the inward being, and which withdrawn, the soul feels instantly its wintry chilliness and desolation. But when the soul is fed upon its God-appointed food, then is the heart hot within, and in holy musing the fire burns bright on the hearth of the affections, the sympathies, and the hopes, though the outward world be drear and chill, though winter mantles the earthly life, though fresh snows rest upon the graves of the most tenderly beloved. There is in such spirits a vital warmth, which radiates from within outward, suffuses the countenance, breathes in cheerful utterances, glows in the whole life, and shows how little man need be dependent on his externals,—how entire and self-contained is the soul that knows its own blessedness,—how true it is that there is a “peace of God, which passeth all understanding” indeed, yet which is proffered for every heart that will seek it aright.

What are the elements of this inward joy,—what the heat-creating food, the fuel of the fire within?

Its first essential element is expressed by the Psalmist, when he says, “The Lord reigneth, let the earth rejoice;” and in still more explicit terms, “The Father himself loveth you.” Without this assurance, I would neither wish to live, nor dare to die. With this, full, deep, and clear, I know not what ought to disturb our tranquillity, or to cloud our joy. If Omnipotent Love presides over our being, what room should there be for repining, discontent, or foreboding? In the Father’s counsels there can be no thought but for the child’s welfare; and the mystery that enwraps his dispensations is only that which must, of necessity, belong to the plans of Him whose vision pierces to the heart and to the depths of eternity, when viewed by the short-sighted and ignorant spirit in the very infancy of its existence. It is enough for us that Infinite Mercy fills the throne of the universe,—that events flow under the guidance of Him to

whom all the souls of men are unspeakably dear, and who will say to the winds and waves of adversity, beat and surge as they may, “Touch not mine anointed, and do my children no harm.”

Another essential element of the fuel-making food of the soul, is the hope full of immortality. St. Paul had seen in vision the joy of the redeemed, had been caught up in revelations of the Lord into the third heaven, and heard the unutterable song which none can learn but those that are redeemed unto God from among men; and thenceforth it would seem that heaven was ever around him and within him, and that earthly trial and calamity had lost all power over his soul. In revelations from the Lord we have the same assurance, which our musings may present in realizing vision, from which our fancy may dress up the eternal mansions, and behold the fields in their ever-living green, the golden gates within which there is no suffering, no night, no winter. We need to dwell upon this prospect, to feed on these promises, to muse upon them till the fire burns, and then by prolonged and renewed musing to kindle it into a life-long flame of holy desire and yearning. In our earthly experience how willingly do we encounter toil, hardship, and loss, in a near and seemingly certain view of a happy issue! And how does the utmost that we can do and bear seem light and of no account, when incurred in the confident pursuit of some great good! O, if we would but think enough of heaven to make its hope constant and vigorous, it would repel every chilling influence from our outward fortunes, would quench with its radiating warmth the icy blasts from our scenes of conflict and sorrow, from our desolate homes and the graves of our kindred. The worst that could befall us would be but as a painful vision of the night when joy cometh in the morning. For what is earthly privation, if at every step the celestial city rises higher, brighter, clearer to our view? What is bodily suffering, if the soul have its sure heritage where all tears are wiped away? And what are our separations through the ministry of death, if we know that we are to meet again where the farewell shall never be uttered?

A. P. P.

MOURNING CUSTOMS.

The customs of society, in their origin at least, are but embodiments of the beliefs of society. The modes of mourning for the dead afford a striking illustration. Taking their rise in the infancy of the world, before the hope of immortality had grown strong, or visions of the future life had become clear, they embodied the conviction that all the relations between the living and the departed were dissolved; that, if the latter survived the dissolution of their mortal frames, they had lost all the personal peculi-

arities that endeared them to the living, by re-absorption into the power that created them; or, they were alienated from God by the frailties of their nature, and banished to the voiceless gloom and dismal slumber of Sheol, the subterranean empire of all departed souls; or, in the light of a more philosophic but inhuman, and equally false theology, they were numbered among the favored few to whom alone the Elysian fields were open. In either, and in every case, all spiritual relations with them were dissolved forever. The goodness, the moral worth, the spiritual loveliness that had endeared them to the living, would be recognized as *theirs* no more. Their expressions of unutterable love had gone out in an eternal darkness; and their voices, instead of being yet vocal with a celestial music, were hushed in the silence of dark, inexorable death. What wonder that their survivors rent their garments, sprinkled dust upon their heads, bottled the tears they shed, wounded their faces with their nails, beat their breasts, and ate their food seated upon the ground! What wonder that they sent forth their wild keens, their broken lamentations in mournfully accordant sounds, hired "Mulieres Pæricæ" to shed tears and sing the praises of the deceased, employed minstrels to mourn and lament for the dead! What wonder that they clothed themselves with sack-cloth, in black, or white, or purple, or yellow, or blue, as the stringent laws of imperious fashion dictated, that they might thus indicate, by every external sign of woe, the bitter grief that had overwhelmed their souls! These were natural, they were inevitable results of the belief that filled their souls.

Eighteen hundred years ago the germs of singular phenomena were becoming apparent in society, standing out in direct contrast to these customs. Side by side with the old Persian and Hebrew eschatology, that, at death, the good and the bad alike were consigned to Sheol—an eschatology which was adopted and dwelt upon by the Christian Fathers, with the addition, on the part of some, that at the second coming of Christ, and at the day of judgment, which they expected immediately, the souls of all men would be liberated from thence; with the addition on the part of others, that all Christians, in virtue of their baptism and their faith, were exempt from passing to the under world, and at death were translated at once to the "Kingdom of God," or to "Life"—side by side with this singular doctrine of last things, there gradually grew up in the Primitive Christian community a more spiritual faith. They became conscious, even in their darkest hours, of the presence of a loving Providence, which permits not a sparrow to fall to the ground unnoticed, which, as it determines the period of our birth and the bounds of our habitations, so, also, never permits us to pass away from the natural world until the best

possible time has come for our entering the spiritual world. To them, consequently, death never was a premature event. Nor only so. To them there were spiritual truths, affections, joys, and states of soul that were realities, over which death and the grave had no power; and those who were taken hence in the Lord were taken only to be restored under more glorious forms—were separated for the moment, in God's and man's immortal life, only in order to be united again with those they had left in a glorified state for all eternity. Nay, the great experience of death, which the heathen had designated as the "black-veiled king of the dead," was hailed by them as an "angel of light," that led the departing to new conditions of existence, in which they would attain to a more complete participation in Christ's divine and blessed life.

To them, heaven was alive with the spirits of their loved ones; their spiritual eye beheld them there, with every vestige of weariness and pain removed, and animated by all holy influences, feelings, and impressions—clothed, not in their funereal garments, but "clothed upon" with robes of light, and that "house which is from heaven." They felt that they were still bound to them by indissoluble bonds—that they were with them—that their intercourse was continued, only under new conditions. Life-giving influences, convictions of duty, immortal aspirations, came from them with inspiring power. And so it came to pass that on the anniversary of their departure, at least, often on each Lord's day, or every returning month, their memory was celebrated by participation in the Supper of the Lord, in the consciousness of an inseparable communion with them; and a gift was laid upon the altar in their name, and in the quenchless faith that they were still living members of the Church! In the words of the most spiritual of all church historians, "Communion with the living and the dead was a communion for eternity, the bond of which, resting in the eternal, could be sundered by no power of death or hell. The Christians had a consciousness of constant, invisible communion with those from whom they were outwardly separated." Before this living faith the old mourning customs fell into desuetude; the dead were clothed in new white garments, to signify "the new clothing of incorruption;" lights were carried before their mortal remains, as symbols of the glory upon which they had entered; and their survivors, while they wept the tears that flowed from their lacerated affections, refused to clothe themselves in weeds of woe, when their friends were putting on the garments of salvation. There were some fashionists then, indeed, who complied with the common mode; but mark what Cyprian said to them—"We ought not to mourn for those who, by the summons of the Lord, are delivered from the world, since we know they are not lost, but

sent before us; that they have only taken their leave of us, in order to precede us. We may long for *them* as we do for those who are on a distant voyage, but not lament them. We must not put on *dark* robes of mourning here below, while, above, *they* have already put on the *white* robes of glory; we must not give the heathens just cause to accuse us both of weeping for them as lost and extinct, of whom, nevertheless, we say that *they are alive with God*, and of failing to prove, by the witness of our hearts, the faith we confess with our lips."

Before the coming of that heathen pestilence which subsequently fell upon the Church, this vigorous faith in the immortal life grew faint; its eye was dimmed, that it could not see the multitude of dear ones that await us in the spirit-land; its ear was rendered dull of hearing, that it could not recognize their celestial voices beseeching us to "come up hither." In fact, that which had been a living faith, a trust of the heart, lapsed into a theoretical belief of the head. The subtle reasonings and definitions of the scholastics, gave a sharpness of outline to one theory after another, that left men no option but to sit in judgment upon the whole, till doubt after doubt arose, and the physical facts and the terrible bereavement attendant upon the departure of their loved ones became the predominant ideas in their minds. The result was, that the earthly side of death was brought prominently into view again. "The Dance of Death," which, notwithstanding its coarse revolting, materialistic tone and character, became everywhere so popular subsequent to the fourteenth century, and the sensuous tone concerning death which found its culminating point in the monumental inscriptions of the seventeenth century, are at once illustrations of our position and evidences of its truth. Instead of an angel of mercy, who takes all the children of our race in his arms and bears them to the Father's throne, death came to be viewed again as an angel of destruction—as a "king of terrors." He was depicted with javelin in hand, or with scythe clutched in his bony fist and just so far as these ideas of this mysterious agency of God became prevalent, the old customs of mourning for those whom it swept away returned upon society, and the beautiful symbols that had spoken at the interment of their mortal remains, of their peace, their glory, and their exaltations were laid aside. The identical usages that heathenism had consecrated were resuscitated. The Irish keen is but a revivification of the "Conclamatio" of the Romans—the "Irish band" of their "*Mulieres præficæ*"—our undertakers, clothed in black, of their "*Designatores*"—the widow's hidden or plainly dressed hair, of the shorn head of antiquity—and the mourning trappings of the horses in our hearses are but substitutes for "their waving manes cut close" of classic days.

A wider induction of facts connected with this subject would only confirm our position. In view of those already adduced, we are inclined to believe that these mourning customs afford us a tolerably exact measure of the amount of Christian faith in the world—that just so far as the former are heartily adopted, the latter is wanting. We say this with a full consciousness that the strongest Christian faith cannot, and was not destined, to stanch the sorrow of our hearts, nor dry the fountain of our tears as we contemplate our own immediate loss in the departure, and it may be in the brighter fate, of those who have gone before us. We have witnessed sufficient scenes of apparent gloom, enough days of grief and bitterness, abundance of all that is sad in experience, to be aware that tears, bitter tears, will often fall in the present life, even though a firm Christian faith should never falter in the soul. Nay, we are willing to admit that there may be relief to the mourner, as he thinks of broken ties, every one of which was a heart-string; as he dwells on the loss of a being who was nearer to him and of more value than any save God—there may be relief to the mourner in casting off from him the shows of life—in attiring himself in something whose dim hue assimilates with "the shadow on the heart;" but we protest against the whole system as unchristian, as indicative of distrust in God and his good providence, which necessitates an entire change in our adornments, and a surrounding ourselves with every external sign of woe when the loved ones are withdrawn. It does but interfere with our serenity and musing whilst we are preparing it, it cultivates our sorrow when we have it, and the dark gloom it spreads around us is pre-eminently calculated to obscure our spiritual vision of that unseen world which becomes more and more distinct to the eye of Christian faith, as one after another of the cherished and the loved ones pass into its mansions.—*London Inquirer*.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FOURTH MONTH 9, 1859.

MARRIED, At the residence of Levi Buckman, in Middletown, Bucks county, Pa., on the 17th of 2d mo. 1859, with the approbation of Makefield Monthly Meeting, WILLIAM LIVEZEY, of Attleboro, to SARAH E. BUCKMAN, daughter of Levi Buckman.

DIED, In Middletown, Bucks county, Pa., on the 22d of 2d mo., 1859, LYDIA WATSON, aged 84 years, 5 months, 3 days; a member of Middletown Monthly Meeting.

LIBRARY NOTICE.

A stated meeting of The Committee of Management of the Library Association of Friends, will be held in the Library Room, on *Fourth* day evening next, the 13th inst., at eight o'clock.

4 mo. 9th, 1859.

JACOB M. ELLIS, Clerk.

The following remonstrance has been sent us for publication. We are informed that it was duly presented, but have not heard whether it has been read, or any action taken upon it.

To the Senate and House of Representatives of the Commonwealth of Pennsylvania, in General Assembly met.

The remonstrance of Sadsbury Monthly Meeting of the religious Society of Friends, of parts of the counties of Lancaster and Chester, respectfully sheweth:—

That at a Monthly Meeting of said people, held at Sadsbury, Lancaster county, on the 9th day of the Second month, A. D. 1859, a concern was introduced in relation to a bill now pending before your body, for the appropriation of funds, (in addition to an appropriation already made) for the erection of a monument to the memory of those soldiers from Pennsylvania, who fell in the late war with Mexico.

On due deliberation the undersigned were appointed as a committee to prepare a remonstrance against such an appropriation, sign it on behalf of said meeting, and lay it before your body.

Our religious Society from an early period have had a testimony to bear against all wars and fightings, believing they originate in the corrupt propensities of the human heart, and are at variance with the Divine will. The Messiah's reign is one of peace, and not of strife. "My kingdom," said he, "is not of this world, else would my servants fight." All the precepts of Jesus Christ inculcate "peace on earth and good will to men." And while we hold that *all* wars are in their very nature repugnant to the spirit, and fundamental principles of Christianity, we have no hesitation in denouncing that between the United States and Mexico as one of unparalleled injustice and enormity, undertaken, as it was, on the part of this nation, at the instigation of the Slave power, and waged mainly for the diabolical purpose of extending and perpetuating the iniquity of human bondage. And inasmuch as all eulogies or enactments of Legislative bodies in distinguishing military achievements, have a potent influence in moulding the mind of the rising generation, we believe the appropriation asked for would be not only an unnecessary expenditure of money, but that it would exert a pernicious influence on the community, by fostering a military spirit which is equally incompatible with the true principles of Christianity and the sound policy of Government, and giving sanction to a war which was regarded at the time, even by many of the advocates of the sword, as unjustifiable on the part of the United States, and that it should not have been prosecuted nor sustained, either by appropriations or voluntary enlistments. In consideration of these views, which are maintained by thousands of others in common with our Society, it appears evident that it would be

morally wrong, as well as unjust to those of conscientious scruples, to apply any part of the public funds to the purpose contemplated in the bill. It behooves not our State, already groaning under a load of debt, to engage in schemes of worse than useless expenditure, and yet if it were merely a question of dollars and cents, we would not intrude upon your time and attention with this appeal.

If we, the citizens of the land of Penn, would transmit to posterity a virtuous and untarnished name, let us not engage in rearing monuments to military heroes on that soil which was obtained of savage hordes, by the illustrious founder of our Commonwealth without the shedding of one drop of human blood.

We therefore earnestly entreat you to refuse to make any further appropriation for the object set forth in the bill, and ask you to repeal the act approved the 22d of Fourth month, 1858, and your memorialists will feel truly grateful.

Signed on behalf of said Meeting, by

JAMES JACKSON,	} Committee.

PAGET VS. MACAULAY.

It was perhaps not to be wondered at that Lord Macaulay should, in the first volumes and in the first editions of his history, have brought charges against William Penn, which more careful inquiry proved to be unfounded, and which, on their original promulgation, struck every reader as wholly irreconcilable with the established character of the celebrated Quaker and philanthropist; for few writers are always accurate, and accuracy never was Lord Macaulay's forte. Neither perhaps was it to be wondered at that Lord Macaulay should have painted the object of his accusation in colors so brilliantly and gaudily black; for it is his nature, and it forms one of the principal, though one of the least defensible, attractions of his style, to deal habitually, like Caravaggio, in the darkest shadows and the most startling and dazzling lights. But it is difficult to account for the peculiarly vicious and almost malignant *animus* which the historian manifests whenever the name of William Penn appears upon his pages—an animus scarcely warranted by his own accusations, even had they been correct, and resembling the persistent hatred with which men usually pursue only their own most personal and bitterest foes. For some reason or other—but certainly for some reason which does not appear, and which we shall not condescend to conjecture—Lord Macaulay had evidently set himself to the task of blackening Penn's character by

every means which research, omission, paraphrase and misconstruction could supply to a writer of his uncommon powers, and discharged this task with the completeness, energy and *gusto* which we bestow only upon labors of love.

Still more difficult it is to account for the historian's persistence in these charges long after the errors into which he had fallen, the misreadings into which he had suffered himself to be betrayed, and the worthlessness of the evidence on which he had relied, had been pointed out to him and placed beyond reasonable doubt. At least, it is difficult to account for this persistence without having recourse to the supposition of motives too unworthy to influence a great man, and too mean and low to influence an honest man. Almost immediately on the first appearance of those fascinating volumes which were to convey to millions of passive and unbelieving minds accusations of guilt and baseness against a character hitherto thought to be one of the brightest and purest in English history—accusations which probably no subsequent defence or recantation will now be able to wipe out,—Mr. W. E. Forster first, in a convincing pamphlet, and, following him, Mr. Hepworth Dixon, in an elaborate life of Penn, after a careful examination of the documentary and other evidence on which Lord Macaulay had relied, showed that no one of the charges could be maintained—that for some there was absolutely no foundation—and that the materials on which others were grounded had been altogether misquoted or misconceived. There were few even of Lord Macaulay's friends—fewer still, if any, of the general public—whom these refutations did not altogether satisfy. Yet edition after edition was suffered by the author to appear, containing the questioned and refuted charges, deliberately and silently reiterated; and not till the year just closed did he deign to take the slightest notice of the proofs and defence which had been submitted to his consideration. In the last edition, however, he has inserted a long note, in which he replies to the arguments and evidence adduced by Mr. W. E. Forster and Mr. Dixon, and declares that he adheres to all his former charges, and considers them fully justified. It is in consequence of this reiteration that Mr. Paget has again examined the whole question, and verified and amplified the former defence by reference to all the original documents bearing on the matter. The points are most clearly and convincingly worked out—the authorities consulted are all specified—and the result of the whole appears to us to leave Penn's character quite clear and his accuser's by no means so.

We have no space to give an analysis of the argument. Indeed it is so concise that it would not bear further condensation; and for the refutation to be properly appreciated, it must be followed step by step. The volume containing it is very small, and very neatly got up, and will

scarcely require more than an hour to master.—*London Economist.*

THE PHYSICAL TRAINING OF GIRLS.

It is matter of common observation that English women belonging to the higher classes unite with their mental accomplishments far greater robustness and strength of physical constitution than are usually found in the females of this country, and all are ready to admit that the human form, in classic antiquity, far exceeded in perfection of symmetry and vigor the ordinary development of the present day. The race that gave to the world a Venus and an Apollo is still regarded as furnishing the best examples of physical strength and beauty; and perhaps those who are familiar with the social customs of the ancient world will concede that this perfection was the result of the systematic training and exercise of the body, then made an essential part of education. In the ages of chivalry, too, when a man held it a greater honor to excel in feats of arms than in scholarship, we read of wonderful achievements of physical strength. But all the lessons of the world's experience in such matters seem to have been lost in our modern civilization, at least in America. Look at the women in our higher circles, with their thin and willowy forms, their pale and sallow faces, their inability to endure the slightest exposure or fatigue. Observe in all classes how early the cheek loses its youthful freshness; how common are complaints of "delicate health"; how universal the appearance of fragility. It is true that public attention has within a few years been in a degree awakened to this subject; but as the light in Milton's infernal prison only served to make darkness visible, so this attention has only exposed the utter and fatal neglect of the duty—a neglect almost everywhere apparent.

If a panoramic view of the evils growing out of neglect of the proper physical training of children could be presented, the horror and alarm created by such a survey would drive fond parents into the adoption of a better system. Mothers who now compel their infant offspring to live as prisoners, pining in vain for fresh air and invigorating exercise, because Mary or Biddy cannot find time to take them out, would not only make the servant perform this duty every day, letting the housework go rather than omit it, but would make some arrangement for more thorough exercise of all the limbs than a mere childish walk can furnish. The little ones allowed to play half the day out of doors, running and wrestling "at their own sweet will," need no gymnasia to develop their strength; but city-bred unfortunates will be benefited by Calisthenic practice. The increase of institutions for this purpose is a good sign. A lady who presides over a large one in this city appropriated exclu-

sively to women, and where there are now thirty invalids, informed us she received children three years and a half old, and would warrant the manifest improvement of their health in three months. Amusement she makes an essential element of these exercises; for as all the muscles of the body should be brought into play, the powers of the mind, so intimately and mysteriously connected with the physical frame, should not be inactive.

We would advocate, or rather insist upon, the attachment of the gymnasium to every school; and if one were in every house, it would prove an actual saving of more than its cost, in physicians' bills, medicines, and nurses', wages. A frolic every day with the "reclining board" or the "parallel bars," would put to flight many juvenile ailments, banish the physic bottles from the shelf, and shed a glow of cheerfulness throughout the household. The benefits that would result to the community and to future generations from such a system, are absolutely incalculable.

The evils of a hot-bed education, where culture of the mind is attempted, with neglect of physical development, are not so universally recognized as they should be. The old adage—"mens sano in corpore sano"—shows the ancient estimate of the parallel culture of body and brain. The dependence of the integrity of the brain on the health of the body—the need that organ has of rest as well as exertion, ought ever to be borne in mind. Nature should be allowed her bent in harmonizing the employment of the intellect with physical activity, by alternate exercise. And no school deserves patronage where this subject has not due consideration.

It was never designed by our Creator that the life of a human being should be made miserable by ill health. Strict observance of his wise laws will secure health; indeed, we would not be afraid to say that any child born of healthy parents, allowed abundance of exercise in the open air through childhood, and preserved in youth from injurious habits, may be sure of immunity from disease, till nature's great debt becomes due in the course of events. Entire freedom from headaches and indigestion, with their train of diseases, will be his portion whose early life has had this judicious training. Think of this, mothers and teachers, we entreat you! and when you opine that an infant "must have worms," or note symptoms of languor in a pupil—ask yourself if the young creature is not suffering from privation of the blessings God gives freely to the poorest, and which cannot be denied without entailing a train of miseries upon such a portion of your life as your neglect may leave to the child under your care. *Boston Transcript.*

They only have lived long who have lived virtuously.—*Sheridan.*

HOW A POOR BOY BECAME A MERCHANT.

Children, and older persons as well, ought always to speak the truth, from a love of doing right, and a loathing of wrong. But it sometimes strengthens upright aims to know that honesty is the best policy, and that one who uniformly adheres to the truth, is certain in the end to prosper. The following story in the *New York Chronicle* has a moral for our young readers:

Two country lads came at an early hour to a market town, and arranging their little stands, set down to wait for customers. One was furnished with fruits and vegetables of the boy's own raising, and the other was supplied with clams and fish. The hours passed along, and each little merchant saw with pleasure his stores were steadily decreasing, and an equivalent in silver bits, shining in his money cup. The last melon lay on Harry's stand, when a gentleman came by, and placing his hand upon it, he said, "What a fine large melon. I think I must have this for my dinner. What do you ask for it, my boy?"

"The melon is the last one I have, sir, and though it looks very fair, there is an unsound spot on the other side," and the boy turned it over.

"So there is," said the man, "I think I shall not take it. But," he added, looking into the boy's fine open countenance, "is it very business-like to point out the defects of your own fruits to customers?"

"It is better than being dishonest, sir," said the boy honestly.

"You are right, my little fellow; always remember that principle, and you will find favor with God and man also. You have nothing else I wish for this morning, but I shall remember your little stand in future."

"Are those clams fresh?" he continued, turning to Ben Wilson's stand.

"Yes, sir; fresh this morning. I caught them myself," was the reply. And a purchase being made, the gentleman went his way.

"Harry! what a fool you was to show the gentleman that spot in the melon. Now you can take it home for your pains, or throw it away. How much wiser is he about those clams I caught yesterday? Sold them at the same price I did the fresh ones. He would never have looked at the melon until he had gone away."

"Ben, I would not tell a lie, nor act one either, for twice what I have earned this morning. Besides, I shall be better off in the end, for I have gained a customer, and you have lost one."

And so it proved, for the next day the gentleman bought nearly all of his fruit and vegetables of Harry, but never invested another penny at the stand of his neighbor. Thus the season passed; the gentleman finding that he could always get a good article of Harry, continually

patronized him, and sometimes talked a few minutes about his future prospects and hopes. To become a merchant was his great ambition; and when the winter came on, the gentleman wanting a trusty boy for his store, decided on giving the place to Harry. Steadily and safely he advanced in the confidence of his employer, until, having passed through various grades of clerkship, he became at length an honored partner in the firm.

Deaths during the month, counting four current weeks for each year,	806	773
The average of the mean temperature of this month for the past 70 years is		38.78 deg.
Highest do. during that period (<i>the present year</i>),		48.25 "
Lowest do. do. (1843.)		30

It will be seen from the above that the mean temperature of the month just closed has been *unprecedentedly* high—our records extend no farther back than 1790, inclusive; and during that entire period it has reached 45 deg. but twice, exclusive of the present year, viz.: 1849—45 deg., and 1842—47 deg.

The amount of rain that has fallen is worthy of notice. The record at the Penna. Hospital states that more has fallen, than during the corresponding month, since the commencement of their Journal in 1825; and that the same remark will apply for the *current three months* of the present year! Also, vegetation in their gardens is at least two weeks earlier. J. M. E.

Philada., 4th mo. 4th, 1859.

TWILIGHT HOURS.

BY BARRY CORNWALL WILSON.

This is the hour, when Memory wakes
Visions of joy that could not last;
This is the hour when Fancy takes
A survey of the past.

She brings before the pensive mind
The hallowed scenes of earlier years,
And friends, who long have been consigned
To silence and to tears.

The few we liked—the one we loved—
A sacred band, come stealing on,
And many a form far hence removed,
And many a pleasure gone.

Friendships, that now in death are hushed,
And young affection's broken chain,

And hopes, that fate too quickly crushed,
In memory bloom again.

Few watch the fading gleams of day,
But muse on hopes as quickly flown;
Tint after tint, they die away,
Till all at last are gone.

This is the hour when Fancy wreathes
Her spell round joys that could not last;
This is the hour when Memory breathes
A sigh to pleasures past.

"LEAD ME TO THE ROCK THAT IS HIGHER
THAN I."

PSALM LXI. 2.

"Lead me to the Rock that is higher than I."
In its shelter I'll hide while the storm passes by.
I'll yield like the floweret that bends to the gale,
And bows without breaking when tempests assail;
Then, rising anew when the storm is o'erpast,
Adore Him, who sends both the calm and the blast.

"Lead me to the Rock that is higher than I,"
When the glare of the noontide is fierce in the sky.
When faint from the "burden and heat of the day,"
O, lend me thy screen from the sun's burning ray!
Within thy cool shadow my altar I'll raise,
And send up the incense of prayer and of praise.

"Lead me to the Rock that is higher than I,"
When my path through the desert is scorching and
dry.

My spirit shall find her deep craving supplied
In the streams of salvation that flow from thy side.
I'll bathe where thy waters refreshingly stray,
And then with rejoicing go forth on my way.

"Lead me to the Rock that is higher than I,"
When the night-wind is chill, to thy covert I'll fly;
Beneath thy protection my couch while I spread,
No damp of the midnight shall fall on my head;
And when the bright morning sheds light through the
skies,

My grateful thanksgiving to thee shall arise.

O, draw me, kind Father, in faith to thy side;
In thy "secret pavillion" I fain would abide.
My covert in danger, my Screen from the heat,
My spirit's Refreshment, my one sure Retreat,
O strong Rock of Ages, my frailty sustain!
Though mountains should crumble, thou still shalt
remain. M. W.

POMPEII.

The foreign correspondent of the *Utica Herald* gives an account of the ruins of Pompeii, as follows:—

I have seen Pompeii. I have walked through its silent streets, wandered amid its deserted shrines, and stood within its desolate halls. No other wreck of the Past has so impressed me. No other Ruin has spoken with so eloquent a tongue. I have seen grander temples, and more imposing columns, and more splendid arches, but none that told so dread and disastrous a tale as this. *They* speak of a life that gradually went out in the Eclipse of Barbarism; but here was the story of a life suddenly arrested in the full glow of health—the golden cord snapped violently asunder. No gradual decay—no insidious snapping of the fountains of life—no slow wast-

ing away, but one fearful, blinding stroke, and all is over. To-day a gay and prosperous city—to-morrow a Ruin. To-day the streets thronged with a busy populace—thousands hurrying to and fro, wealth and station looking contemptuously down on Poverty; sin flaunting in gay attire; speculation and commerce busy with their ledgers counting loss and gain; the dance, the song, and the revel at their height; Pleasure busy with its little Paradise,—and to-morrow Death rampant over all. The throbbing pulse still—the eloquent lips mute—the glowing face—cinders! No time for preparation—no avenues of escape—one prayer to gods who could not save—and the keen agony was over.

Such is the story the ruins of Pompeii tell with their mute but eloquent lips. You read it in every mouldering pile—on the corner of every silent street—in every deserted hall. You read it in the palaces of the rich and the hovels of the poor,—in the workshop, in the forum, in the theatre, in the temples of the gods. The implements of Toil—the gewgaws of Wealth—the bath and the couch are all there. The marble halls—the vaulted ceilings—the walls gorgeous with paintings—the flowers of matchless mosaics are there—*almost* as bright and beautiful—almost as rich and resplendent—as when the occupants were summoned away. Death, which swept every living thing with its fierce and fiery tide, has mercifully spared the material.

Remember you, it is not here and there an isolated ruin. Pompeii presents to the wonder-stricken traveller, but miles and miles of *continuous* wreck. We are on the Street of Fortune. It is a long, straight, and beautiful thoroughfare. The pavement is hard and smooth, (consisting of small blocks of lava-stone) The ruts made by the wheels of the chariots—in some instances two and three inches deep—are distinctly visible. On either side are narrow sidewalks, just such as you see in some of the German and Italian cities of to-day. Portions of the walls of nearly all the houses are yet standing. Some are large and some small—some gorgeous and some plain—just as we see rich and poor now. Here is a stately mansion, the residence of one of the chief citizens. Let us enter. A wide hall, and we are in the interior court. The court is square, and is surrounded by beautiful Ionic columns, whose graceful capitals lose themselves imperceptibly in the rich carvings of the ceiling. The floor is of the most exquisite mosaic, in which the most delicate and ingenious pictorial representations are wrought. Some of these are allegorical and mythical—the virtues and the vices, gods and goddesses, heroes and demi-gods. Some are historical, fanciful domestics,—all wonderfully preserved, and all exquisitely wrought. To the right, a door opens into the banquetting hall—with floor of still more delicate mosaic—with walls and ceiling covered over with still more

wonderful paintings. Not a feature marred—not a bit of carving or mould defaced,—you wonder the lord of the mansion is not there to greet you. Further on, and we are in the bed room,—small but cozy—plain but airy—the very ideal of a sleeping apartment. From the burnished wall and glittering ceiling, look down troops of laughing Loves and lascivious Venuses, eloquent memorials at once of the refinement and the vices of the denizens of the dead city. A narrow passage leads to the bath-room with its fine vaulted roof, and the walls rich in pictures and vases of porphyry and alabaster, and remains of luxurious couches; an apartment fit for the revels or repose of a King. Then other and other apartments, all bespeaking wealth, luxury, refinement, vice. And lastly, the garden with its sculptures and remains of fountains, and shady avenues, and dreamy bowers. And yet this house with all its blaze of wealth and beauty has been tenantless sixteen centuries?

I leave the street of Fortune—the Fifth Avenue of Pompeii—and enter the realm of Trade and Toil. Here are the workshops of the mechanic—the magazine of the manufacturer—the humble stall of the dealer in small wares. Here are the cauldron of the soap-boiler, the vats of the distiller, the measures of the dealers in grain, the implements of the artisan, the utensils of the cook. Here are the public fountains, around which the dark-eyed maidens of Pompeii gossip in the warm summer evenings. The public houses (with the signs *still* over the door,) where the gossips and the sots resorted; the broad avenue along which youth and pride and beauty swept in their gorgeous chariots; the very foot-marks of the multitude as they rushed to the theatre or the temples of their gods. Every chariot-furrowed stone—every pictured wall and glistening column, every hoary pile and silent avenue—speaks. Nothing seems dead but man.

COTTON CULTIVATION IN AFRICA.

The English are intent upon testing cotton cultivation in Africa. In a soil so prolific, and with the seasons so well marked as in that immense continent, there seems to be but little doubt that an indigenous plant like cotton would thrive under proper care. The natives are reported to be willing to engage in producing the staple. About two hundred and fifty thousand pounds of cotton, "equal to the Georgia article," was received in England during last year from Western Africa. This success has induced a shipment last month, from Liverpool, of upwards of fifteen thousand dollars worth of machinery and requisite materials to enable efforts further in the interior of Western Africa, establish new cotton stations, and prosecute the matter with still more vigor. The cotton supply association, of Manchester, is calling forth the energy of the people and the

government of Liberia, by offering prizes and medals for successful cultivation of cotton. With good roads throughout the country, and steam on the navigable streams, no doubt can be entertained that Liberia and Africa generally, may be readily made one of the most important cotton producing countries in the world. The settlement of intelligent colored people from the United States, as well as the planting of churches, schools and free governments, and the opening of legitimate commerce, will conspire rapidly to effect a complete and speedy transformation of that long unknown land, into one of the most attractive and prosperous portions of the earth.

SPEED.

Dr. Lardner, in one of his recently published scientific works, endeavors to convey to the reader some idea of the enormous speed of the locomotive going at the rate of seventy miles an hour. Seventy miles an hour, is, in round numbers, one hundred and five feet per second, that is a motion in virtue of which a passenger is carried over thirty-five yards between two beats of a common clock. Two objects near him, a yard asunder, pass his eye in the thirty-fifth part of a second; and if thirty-five stakes were erected by the side of the road, one yard asunder, the whole would pass his eye between two beats of the clock; if they had any strong color, such as red, they would appear a continuous flash of red. At such a speed, therefore, the objects on the side of the road are not distinguishable. When two trains having this speed pass each other, the relative velocity will be double this, or seventy yards per second; and if one of the trains were seventy yards long, it would flash by in a single second. To accomplish this, supposing the driving wheels seven feet in diameter, the piston must change its direction in the cylinder ten times a second. But there are two cylinders, and the mechanism is so regulated that the discharges of steam is alternate. There are, therefore, twenty discharges of steam per second, at equal intervals; and thus these twenty puffs divide a second into twenty equal parts, each puff having the twentieth of a second between it and that which precedes and follows it. The ear, like the eye, is limited in the rapidity of its sensation; and, sensitive as that organ is, it is not capable of distinguishing sounds which succeed each other at intervals of the twentieth part of a second. According to experiments that have been made, the flight of a cannon ball was six thousand seven hundred feet in one quarter of a minute, equal to five miles per minute, or three hundred miles per hour. It follows, therefore, that a railway train, going at the rate of seventy-five miles per hour, has the velocity of one-fourth that of a cannon ball.

Many of the accidents which happen to persons attempting to cross railroads are the result of ignorance of the velocity of the iron horse when fairly under way.

If a man with a horse and carriage upon an unimportant public road in a country town, should approach and cross the track at a speed of six miles per hour, which would be crossing rapidly, an express train approaching at the moment would move toward him two hundred and fifty-seven feet while he was in the act of crossing a distance barely sufficient to clear the horse and vehicle. If the horse was moved at a rate no faster than a walk, as the track is usually crossed, the train would move toward him while in the act of crossing more than five hundred feet. This fact accounts for the many accidents at such points. The person driving thinks he may cross because the train is a few rods distant.

THE VALUE OF EMPLOYMENT.

Since both soul and body are made for exertion, there is nothing more conducive to cheerfulness, the result of their joint health, than fit employment. A house bereft of tenants goes to decay. A vehicle laid up without use rusts and moulders. A fine piece of machinery is never so safe, as when lubricated and moving. Body and soul made for perpetual activity, must work and work together, in order to be in good condition. Of all engines, the human body is the most amazing. From the days of Socrates, as reported by Xenophon, philosophy has been studying the mechanics, the chemistry, the vital forces, the adaptations, the final causes of this structure, so wonderfully made. There are no steps forward to new principles in physics, in optics, in the growth of structures, which does not find itself anticipated by some marvellous realisation of its idea in the human body. Considered as a working engine, there is none which works so cheaply, with so little waste, and so long, or which contains such provisions for its own repair. How every survey of the skillful mechanism shows that it was made to move.— Its central propelling engine never stops, except in cases which cause instant dread of death. Heart, lungs, and brains, play on through all the thousand nights of sleep. An instinct of nature prompts the young to be in almost perpetual motion. Absolute rest there is none. And if, from necessity or choice, any approach to immobility becomes the habitude of body as is the case in some sluggish and morbid natures, the result is lethargy and endless disturbance of the vital functions. This frame was made for labor.

Equally true is this of the yet more subtle because spiritual part. The soul is essentially active. Of a mind that does not think, no man can frame a notion. The human mind is made

to be active. It is inquiring, and athirst for knowledge. Its active powers irresistibly seek for some object on which to exert themselves. Healthful, moderate repose, chiefly by change of employment, is good; but entire, continual, unbroken quiescence, is misery. Never was there a more dire mistake than that of men who abandon the honest and useful business of life, under the pretext of rest. Unless they have singular resources, in science, literature, or philanthropy, they sink into hebetude, weary of the everlasting holiday, let their hearts corrode with sullen thoughts; and sometimes fall a prey to evil habits or premature dotage. Philosophy, no less than religion, enjoins—unless where invincible necessities from infirmity or age clearly speak another language—that we should live working, and die in the harness. Hence the value of a trade or calling, and of working at it. I believe it lengthens life. I believe it staves off tribes of maladies and conceits. I am sure it promotes that spring and elevation of soul, without which life is a long disease. If you would find the most wretched man or woman in your neighborhood, look for the one who has nothing to do. Unless allowed to prescribe employment, even the best physician cannot cure the valetudinary complainer. For after all has been said, employment begets cheerfulness; and a “merry heart doeth good like a medicine.”

J. W. ALEXANDER.

DAILY IMMERSION OF THE HEAD.

Dr. Bissell, one of the Quarantine physicians at Staten Island, in giving the testimony touching the matter of the late riots, stated it as his opinion, “that if a person’s hair is washed and combed every day, he is not liable to disease.”

The Norfolk Herald adds the following corroborative testimony:

“So important a result from so simple a cause may seem incredible to many, but not to us. There is not a more effectual preventative of disease than the immersion of the head in cold water the year round. We know an old gentleman, now rising of seventy, who says that until he was thirty years old, he was of a weakly constitution, and particularly liable to attacks of bilious fever, violent colds and headache; but having heard that the best preventive of headache was to wash the head in cold water every morning immediately after rising, he then commenced the practice, and has continued it to the present time, and during the interval of forty years has never had the bilious fever, hardly knows what the headache is, and though sometimes taking cold, he has never had a cold that hindered him from attending to his ordinary affairs; add to this he passed unscathed through the terrible epidemic of 1855.”

CULTIVATE ENERGY.

Many of the physical evils—the want of vigor, the inaction of the system, languor, and hysterical affections—which are so prevalent among the delicate young women of the present day, may be traced to a want of well-trained mental power, and well-exercised self-control, and to an absence of the fixed habits of employment. Real cultivation of the intellect, earnest exercise of the moral powers, the enlargement of the mind, by the acquirement of knowledge and the strengthening of its capability for effort, the firmness for endurance of inevitable evils, and for energy in combatting such as may be overcome, are the ends which education has to attain; weakness, if met by indulgence, will not only remain weakness, but become infirmity. The power of the mind over the body is immense. Let that power be called forth; let it be trained and exercised, and vigor, both of mind and body, will be the result. Better, a million times better, to work hard, even to the shortening of existence, than to sleep and eat away this precious gift of life, giving no other cognisance of its possession. By work, or industry, of whatever kind it may be, we give a practical acknowledgement of the value of life, of its high intentions, of its manifold duties. Earnest, active industry, is a living hymn of praise, a never-failing source of happiness; it is obedience, for it is God’s great law for moral existence.

ITEMS OF NEWS.

THE COST OF WAR.—Great Britain is now paying twenty-eight millions of pounds sterling, or nearly one hundred and forty millions of dollars a year interest on the war debt which she has contracted in times past. In addition she is paying over one hundred millions of dollars a year to maintain her present defences. The warfare of Great Britain, therefore, costs about two hundred and fifty millions of dollars a year.

The *New Orleans True Delta* protests against cruel, arbitrary or unjust legislation against free negroes in Louisiana, of whom there is “a large native resident population, correct in their general deportment, honorable in their intercourse with society and free from reproach, so far as the laws are concerned; not surpassed in the inoffensiveness of their lives by any equal number of persons in any place, North or South.”

A LARGE AMOUNT of loss has been sustained by the coal operators in the mining regions of Pennsylvania, in consequence of the mines having been flooded by the recent heavy rains.

The *Little Rock Gazette and Democrat* of the 19th ult. contains the following:

THE FREE NEGRO BILL—The Legislature has passed a bill to expel free negroes from the State. They have until January, 1860, to dispose of their property, and make other arrangements for leaving. If they do not go then, it is made the duty of sheriffs, to seize them and hire them out to the highest bidder for one year, giving them the net proceeds of their labor to enable them to leave the State. The bill provides that such free negroes as desire to remain, may choose masters

—the County Court having them appraised, and the master or mistress they have chosen paying half their value into the Common School fund of the county."

THE POOR NEGRO.—The late Arkansas Legislature passed a law, which is to take effect from the 1st of January, 1860, prohibiting the employment of free colored persons on water craft navigating the rivers of that State. A violation of this law is to be considered a high misdemeanor, and, upon conviction, subjects the party having charge of such craft to a fine of from \$500 to \$1000, and an imprisonment not exceeding twelve months.

THE NEW CENT POISONOUS.—It is stated that several instances have occurred in different parts of the country where children have died from the effects of poison taken into the system, by swallowing the new nickel cent. As this coin is small and easily swallowed, there is great danger in allowing young children to have them in their possession. The metal which composes it has had a fatal effect, and would seem to be poisonous.—*North American.*

The election in Kansas on the 28th ult. on the question of calling another Convention to form a State Constitution, is reported as having resulted in favor of the call. Leavenworth City gave a majority of 406, in a total vote of 1,648, in favor of prohibiting the opening of liquor saloons on the first day of the week.

The Personal Liberty bill which was pending in the House of Representatives of Massachusetts, was defeated on the 30th ult. by a majority of three. A bill passed the Legislature of Michigan a few weeks since, making it a crime to "bring a negro, mulatto or other person into the State, claiming him or her as a slave," and punishing the act with imprisonment not more than ten years, and a fine not exceeding \$1,000.

The number of Mormons in the United States in 1856 is stated at 47,000, of whom 38,000 were resident in Utah. The total number of the sect in the whole world was not less than 126,000. In 1857, the population of Utah appears to have decreased to 31,022.

Official documents show that the emigration from Bremen, during the year 1858, amounted to 12,450 passengers to New York, the entire number to the United States being 23,127. During the last ten years, the emigration from Great Britain and Ireland has been 2,756,000, from Germany 1,200,000, and from France scarcely 200,000. Nearly half of the French emigrants during that time have gone to Algeria.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is inactive, without change in prices. We quote sales of superfine Flour at \$6 25 per bbl., and \$6 37 a 6 75 for extra family. The sales to the retailers and bakers are within the range of the same figures, and fancy lots at from \$6 87 to 7 50. Sales of Rye Flour and Corn Meal continue limited. The former at \$4 25. Corn Meal is held at \$3 87.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 56 a 1 58 per bushel for fair and prime red, and \$1 65 a 1 75 for prime white. Rye is less active and sells at 88 a 90c. Corn is in demand; sales of yellow at 86 cts. Oats are steady; sales of prime Pennsylvania at 55 cts., and Delaware and Jersey at 54 cts.

CLOVERSEED is inactive at from \$5 25 to 5 50 per 64 pounds. Timothy commands \$2 25 a 2 37 per bushel, and Flaxseed at \$1 70 a 1 75.

HIGHLAND DALE.—Charles and Catharine Foulke inform their friends that their house will be open for the reception of boarders, early in the 6th month. It is an elevated situation, one mile from Stroudsburg, and four miles from the Delaware Water Gap.

The cars leave Walnut Street wharf every morning for Stroudsburg.

The price of board in 6th and 7th months, will be \$6 per week, and in the 8th month, \$7 per week. Children under 12 years, half price.

4th month, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P O., Burlington Co., N. J.

4th mo. 9—3m.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next session of this Institution, on the 2d of 5th mo. next. For reference and further particulars, enquire for circulars of Principal,

BENJAMIN SWAYNE.

London Grove, 22d of 3d mo., 1859.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON,

MAGGIE B. JACKSON,

} Assistants.

Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER,

SUSANNA G. CHANDLER,

} Proprietors.

3d mo. 19, 1859.—10 t.

ELDRIDGE'S HILL BOARDING SCHOOL FOR THE EDUCATION OF YOUTH OF BOTH SEXES.—All the branches of a liberal English Education are thoroughly taught in this Institution. Also the French and Latin languages.

The summer session will open on the 3d of 5th mo., 1859, and continue 20 weeks, terms \$70 per session.

For full particulars address the Principal for a circular.

ALLEN FLITCRAFT,

Eldridge's Hill, Salem County N. J.

2 mo.

ORANGE GREEN BOARDING SCHOOL FOR GIRLS.—The Summer Term will commence on the 11th of 4th month next. The location is unusually healthy and pleasant; the course of study extensive and thorough. Terms Thirty-six Dollars per session of thirteen weeks.

For particulars, address Principals,

SIDNEY PUSEY, OR

FANNY A. KINSEY.

Kennett Square, Chester Co., Penna.

2d mo., 1859.—2m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FOURTH MONTH 16, 1859.

No. 5.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A Testimony of Baltimore Monthly Meeting, for the Western District, concerning our deceased friend ELIZABETH THOMAS.

When a valuable example is removed, and the tender exhortations of a dear friend are no longer heard amongst us, we believe that it may be profitable to those who have experienced such privations, to preserve some memorial of the virtues which have once stood conspicuous; under the influence of these feelings, this brief account of the life of our beloved friend Elizabeth Thomas has been written.

She was born in Kent County, in the State of Maryland, on the 18th of the 2nd month, 1778. Her parents, Robert and Ann George, were exemplary members of the Society of Friends, and careful to educate their children in a knowledge of the principles which they professed. She was, however, deprived of both her parents, about the 20th year of her age, and in consequence of this loss, was exposed to a path of great difficulty and danger. Upon their decease, she removed into the family of a near relation, not members of our Society; and was thus introduced into a circle of gay and fashionable acquaintances; but notwithstanding the attractions and allurements by which she was surrounded, she was remarkably preserved in singleness of mind, and was a sincere lover of the truth. She had not made much outward profession of religion, but continued to be a constant attender of her meeting, although it was situated seven miles distant from her residence, and was at that time without any outward ministry.

In the 23d year of her age she was married to Philip E. Thomas, and removed to the city of Baltimore, where she continued to reside until the time of her death. The many excellent

traits which adorned her character, endeared her to all who knew her. Her natural disposition was cheerful and happy; her feelings were amiable and kind towards all; and to her family and friends she was tenderly attached.

Possessing an abundance of the things of this world, her mind was still preserved from the influence of its fascinating pleasures; the fleeting joys of life had not the power to detach her from the path of duty; she viewed the things of time, as unsubstantial treasure, and was sincerely desirous of laying a more sure foundation for everlasting peace. Thus impressed with a sense of our great responsibility as rational beings, her mind was seriously concerned for the future welfare of the whole human family; and about the year 1804, she first appeared in public communications; tenderly inviting all to choose the Lord for their portion: her Gospel labors being acceptable to her friends, she was in due time received by the meeting as an approved minister.

Cherished and beloved by her friends, she lived in great harmony with them; but the endearing ties of domestic life were not permitted to engross her whole attention; in the midst of the bounties of providence, and the enjoyment of social intercourse, she remembered the poor, and tenderly sympathised with the afflicted,—and notwithstanding her constitution was delicate, and the cares of a family were now resting upon her, she was at all times interested in the cause of humanity; visiting the sick, and administering consolation to the sufferer. When physical strength permitted, she was prompt in her exertions to alleviate the distresses of the needy; and the blessings which she had freely received were dispensed with a liberal hand. But whilst engaged in these acts of benevolence, she was ever careful to avoid an ostentatious display of her own works; and in many instances, the grateful acknowledgements of those who had experienced her kindness, conveyed the only information which was possessed by her most intimate friends, of what she had done.

For several years previous to her death, her health was gradually declining, and she was frequently so much reduced by disease, that there appeared but little prospect of her recovery. These afflictions she bore with that meekness which has ever characterised the true follower of Christ.

In the latter part of the year 1835, a cancerous tumor was discovered in her breast, which subjected her to much severe suffering; and in condescension to the anxious wishes of her friends, she submitted to a surgical operation. But medical skill proved unavailing, the disease again appeared, with increased violence; and though she was prevailed upon to have the operation repeated, she appeared herself perfectly sensible that no benefit would result from it. As the disease progressed, her sufferings became still more severe, which produced extreme debility of the nervous system, and rapidly prostrated her remaining strength. She was still graciously supported through all her sufferings; frequently expressing an entire resignation to the Divine Will, and a firm conviction that this visitation was permitted, not wholly on her own account, but that, if duly improved, it would be sanctified to some others.

In the early part of the 9th month, 1837, she became very feeble, so that she was seldom able to sit up; but still continued to converse with her friends. Upon one occasion, when surrounded by her family, after a time of solemn quiet, she said, "The day that I have just passed has been to me a season of sore and deep affliction, and oh, that I may be supported in patience and resignation to bear the sufferings that may yet await me; I have all my life had an appalling dread of death by cancer, from an apprehension of its lingering and excruciating misery; but I now fervently crave that I may resign myself without a murmur, to this dispensation.—Many and sore have been the baptisms that have been allotted me, and at times the billows have passed very high over my head; but although my grain of faith has been tried to within a hair's breadth, so far it has not wholly failed me, and I have never doubted the sufficiency of that power on which my soul has reposed for safety. And now, O Lord, may I once more be permitted to supplicate for a continuance of thy mercy and goodness towards me, in the awful and trying season to which I am approaching; forsake me not, I beseech thee oh God, for I am sensible that it is thou alone that can support me; withhold not from me, O Father, a sense of thy presence; be with me through the valley of the shadow of death; and grant that this dispensation may be sanctified, not only to my own further refinement, but that it may also be made a blessing to those around me."

Notwithstanding her physical sufferings were extreme, her mind still continued to be clothed with a sweet inward peace, which was far more precious to her than all outward enjoyments. To a friend who called to see her, and who expressed much sympathy with her, in her severe affliction, she replied, "Of ourselves we can do nothing, but through the adorable mercy of infinite goodness, so far, I have been sustained, and my mind

is preserved in calmness and peace, and at times the language of my heart has been, return to thy rest, oh my soul, for the Lord hath dealt bountifully with thee."

During the night of the 11th of 10th month, she slept unusually well, and on the following morning appeared to be refreshed, and was more free from pain than she had been for a long time. After giving directions respecting some tokens of gratitude which she wished to have presented to the domestics in her family, she calmly added, "there is now nothing in my way, and I have not any solicitude nor choice, as regards the time of my departure; but feel wholly resigned to the Divine Will; a full assurance is given me, that there is a place prepared for me, where there will be neither pain nor sorrow, but peace and joy for evermore."

From this time she remained in a tranquil state of mind, waiting the expected summons, and appearing to desire stillness rather than conversation. Her pain was frequently severe, and her strength continued gradually to decline until the morning of the 18th of 10th month, 1837, when her gentle spirit was released, and as one falling into an easy sleep, she quietly passed away; being in the 60th year of her age.

Having submitted in early life to the purifying influence of the Holy Spirit upon her mind, she was enabled with unwavering faith to pursue her path of duty; and in the various relations of her domestic, social, and religious obligations, she was a precious example: and having carefully occupied the talents committed to her, we doubt not that her spirit has realized the fulfilment of the promise of our Divine Master, "Blessed are the pure in heart, for they shall see God."

It is a great art in the Christian life to *learn to be silent*. Under oppositions, rebukes, injuries, *still be silent*. It is better to say nothing, than to say it in an excited or angry manner, even if

the occasion should seem to justify a degree of anger. By remaining silent, the mind is enabled to collect itself, and to call upon God in secret aspirations of prayer. And thus you will speak to the honor of your holy profession, as well as to the good of those who have injured you, *when you speak from God.*

THE BENEVOLENT HOWARD'S EXPERIENCE.

Regarding children as creatures possessed of strong passions and desires, without reason and experience to control them, he thought that nature seemed to mark them out as the subjects of absolute authority; and that the first and fundamental principle to be inculcated upon them, was implicit and unlimited obedience. This cannot be effected by any process of reasoning before reason has its commencement, and therefore must be the result of coercion. The coercion he practised was calm and gentle; but, at the same time, steady and resolute. I shall give an instance of it, which, says Dr. Aiken, I had from himself. His child one day wanting something which he could not have, fell into a fit of crying which the nurse could not pacify. Mr. Howard took him from her, and laid him quietly in his lap, till fatigued with crying he became still. This process, a few times repeated, had such an effect, that the child, if crying ever so violently, was rendered quiet the instant his father took him. In a similar manner, without harsh words and threats, still less blows, he gained every other point which he thought necessary to gain. Notwithstanding this, he himself often feelingly lamented the loss of his wife's assistance in forming the early habits and correcting what was wrong in the temper of his son. He felt and acknowledged, as every sensible man must acknowledge, how much more capable is a prudent and tender mother of managing a young child, than the kindest father possibly can be. There is a somewhat of gentleness, of fondness, of *never slumbering* watchfulness, and, as it were, of *instinctive foresight*, in maternal solicitude, which no attention, however anxious, on the part of surviving relatives, near as they may be, can ever supply.

For Friends' Intelligencer.

THE MILITARY SYSTEM.

The military system is one that presses heavily upon the best interest of the country, physically, morally and religiously. This system, if it does not form the basis of our government, is looked to for its protection; hence the policy of drawing support and patronage for it from all the subjects of government; a proceeding which would be just and right, were it not that the system in itself is wrong.

The Society of Friends, from its earliest rise, has held war to be irreconcilable with Christianity, and have valiantly borne aloft their tes-

timony against it, through sacrifice and suffering. We were almost led to hope this righteous testimony might be still gaining ground, from reading in the 52d No. of the Intelligencer an address of the Representative Committee of Philadelphia Yearly Meeting, expressing a concern that Friends should be faithful and consistent with our profession, in declining to aid or countenance a military system. Our attention was particularly impressed with some of the closing remarks, viz.: "We, therefore, affectionately caution our members against the acceptance of any civil office which may involve them, either directly or indirectly, in the violation of our testimony against war."—This advice certainly is unexceptionable. It is evidently founded upon the principle, that a civil office, which in itself might be laudable and proper, would, if connected with the war system, be one which could not be consistently accepted by a Friend. Now, the question occurred, whether it would not be equally inconsistent for a Friend to confer the objectionable office upon another, as to accept it himself? In other words, whether a Friend is consistent in casting a vote for another to fill an office which he could not himself accept, on account of its connection with the military system?

The testimony of Friends on this subject is of such importance, that any obstruction to its spread in the community by inconsistency or compromise of principle on our part, is to be regretted, to avoid which, Friends have much need to stand aloof from politics.

It is believed the more we become the devoted subjects of Him who declared that "his kingdom was not of this world," the more we shall be disinclined for any active service in the operations of a government depending upon deadly weapons for its maintenance.

The testimony against war is worthy to be sustained at any sacrifice that may be necessary to its being exhibited in its Christian excellency and purity.

D. I.

Dutchess county, N. Y., 3d mo., 1859.

How pleasant, how delightful is a holy imagination? It instinctively refuses and throws away everything that can defile. It is a sort of inner sanctuary; or perhaps we may call it the bridal chamber of the soul, fitted up and adorned with every thing pure in earth and beautiful in heaven; and God himself is the bright light thereof.

It is not by the mere number of our words and actions, that we can most effectually serve the cause of God, and glorify his name. It is the temper in which they are done, rather than the mere multiplication of them, which gives them power. It was the remark of a good man, who had much experience as a minister of the gospel, that "*we mar the work of God by doing it in our own spirit.*"

For the Yearly and Second-day's Meeting in London. And to all the children of God in all places in the world. By and from G. F.

This for all the children of God everywhere, that are led by his Spirit, and do walk in his light, in which they have life and unity and fellowship with the Father and the Son, and one with another.

Keep all your meetings in the name of the Lord Jesus, that be gathered in his name, by his light, grace, truth, power and spirit. By which you will feel his blessed and refreshing presence among you and in you, to your comfort and God's glory.

And now all Friends, all your meetings, both Men's and Women's Monthly and Quarterly, and Yearly, &c., were set up by the power and spirit and wisdom of God. And in them you do know that you have felt both his power and spirit and wisdom, and blessed refreshing presence among you and in you, to his praise and glory, and your comfort; so that you have been a city set on a hill that cannot be hid.

And although many loose and unruly spirits have risen betimes to oppose you and them, both in print and otherwise; yet you have seen how they have come to naught; and the Lord hath blasted them, and brought their deeds to light, and made them manifest to be trees without fruit, and wells without water, and wandering stars from the firmament of God's power, and the raging waves of the sea, casting up their mire and dirt; and many of them are like the dog turned to his old vomit, and the sow that was washed turned again to the mire.

And this hath been the condition of many, God knoweth, and his people.

And therefore, all stand steadfast in Christ Jesus, your head; in whom you all are one, male and female, and know his government, and of the increase of his government and peace there shall be no end.

But there will be an end of the devil's, and of all them that be out of Christ, and do oppose it and him; whose judgment doth not linger, and their damnation doth not slumber. And therefore, in God and Christ's light, life, spirit, and power, live and walk, (that is over all, and the seed of it) in love, and innocency and simplicity, and in righteousness and holiness dwell, and in his power and Holy Ghost, in which God's kingdom doth stand.

All children of new and heavenly Jerusalem (that is from above, and is free, with all her holy spiritual children) to her keep your eyes.

And as for this spirit of rebellion and opposition that hath risen formerly and lately, it is out of the kingdom of God and heavenly Jerusalem; and is for judgment and condemnation, with all its books, words and works. And, therefore, Friends are to live and walk in the power and spirit of God, that is over it; and in the seed

that will bruise and break it to pieces: in which seed you have joy and peace with God, and power and authority to judge it. And your unity is in the power and spirit of God that doth judge it, and all God's witnesses in his tabernacle go out against it, and always have and will.

And let no man live to self, but to the Lord, as they will die in him; and seek the peace of the church of Christ, and the peace of all men in him, for blessed are the peace-makers; and dwell in the pure, peaceable, heavenly wisdom of God, that is gentle and easy to be entreated, that is full of mercy; all striving to be of one mind, heart, soul and judgment in Christ, having his mind and spirit dwelling in you; building up one another in the love of God, which doth edify the body of Christ, (his Church,) who is the holy head thereof. So glory to God through Christ, in this age and all other ages; who is the rock and foundation, and the Emanuel, God with us. Amen, over all, the beginning and the ending. In Him live and walk; in whom you have life eternal; in whom you will feel me, and I you.

All children of New Jerusalem that descends from above, (the holy city, which the Lord and the Lamb is the light of, and the temple,) in it they are born again of the spirit. So Jerusalem that is above is the mother of them that are born of the spirit; and so they that come, and are come, to heavenly Jerusalem, are those that receive Christ, (and he giveth them power to become the sons of God,) and are born again of the spirit. So Jerusalem is their mother, and such do come to heavenly Mount Zion, and the innumerable company of angels, and to the spirits of just men made perfect; and are come to the church of the living God, written in heaven, and have the name of God and the city of God written upon them.

So here is a new mother that bringeth forth a heavenly and spiritual generation. There is no schism, nor division, nor contention, nor strife, in heavenly Jerusalem, nor in the body of Christ, which is made up of living stones, a spiritual house.

And Christ is not divided; for in him there is peace. Christ saith, "in me you have peace." And he is from above, and not of this world; but in the world below, in the spirit of it, there is trouble. Therefore keep in Christ, and walk in him, Amen. G. F.

And Jerusalem was the mother of all the true Christians before the apostacy; and since, the outward Christians are broken into many sects, and they have gotten many mothers. But all they that are come out of the apostacy, by the power and spirit of Christ, Jerusalem that is above is their mother (and none below her), who doth nourish all her spiritual children. G. F.

London, the 4th of the Fourth month, 1691.

DEAR FRIENDS:—We being appointed by

dear George Fox and the Yearly Meeting, to consider of a method for the printing his books, papers, epistles, manuscripts, desire you will make search in your Quarterly and Monthly Meeting books, and among Friends, what books, papers, epistles, or manuscripts you have of his; and send up the titles and dates of them that are dated, and the first and last words or sentence of each book, paper or manuscript; that we may better distinguish one from another, of all books, papers, or manuscripts, written or printed.

So not doubting your care and diligence herein, with our dear loves, we rest your friends and brethren,

John Blaiklin,	John Whitehead,
George Whitehead,	Thomas Robbertson,
Thomas Dockraw,	Benjamin Autrobus,
William Mead,	Thomas Lower,
John Reuse,	Thomas Ellwood,
John Vaughton,	John Field,
	Stephen Crisp.

From the Atlantic Monthly.

DOUGHT WOMEN TO LEARN THE ALPHABET?

Paris smiled, for an hour or two, in the year 1801, when, amidst Napoleon's mighty projects for remodelling the religion and government of his empire, the ironical satirist, Sylvain Maréchal, thrust in his "Plan for a Law prohibiting the Alphabet to Women." Daring, keen, sarcastic, learned, the little tract retains to-day so much of its pungency, that we can hardly wonder at the honest simplicity of the author's friend and biographer, Madame Gacon Dufour, who declared that he must be partially insane, and proceeded to prove himself so by replying to him. His proposed statute consists of eighty-two clauses, and is fortified by a "whereas" of a hundred and thirteen weighty reasons. He exhausts the range of history to show the frightful results which have followed this taste of the fruit of the tree of knowledge; quotes the *Encyclopédie*, to prove that the woman who knows the alphabet has already lost a portion of her innocence; cites the opinion of Moleire, that any female who has unhappily learned anything in this line should affect ignorance, when possible; asserts that knowledge rarely makes men attractive, and females never; opines that women have no occasion to peruse Ovid's "Art of Love," since they know it all in advance; remarks that three-quarters of female authors are no better than they should be; maintains that Madame Guion would have been far more useful, had she been merely pretty and an ignoramus, such as Nature made her,—that Ruth and Naomi could not read, and Boaz probably would never have married into the family, had they possessed that accomplishment,—that the Spartan women did not know the alphabet, nor the Amazons, nor Penelope, nor Andromache, nor Lucretia, nor

Joan of Arc, nor Petrarch's Laura, nor the daughters of Charlemagne, nor the three hundred and sixty-five wives of Mohammed;—but that Sappho and Madame de Maintenon could read altogether too well, while the case of Saint Brigitta, who brought forth twelve children and twelve books, was clearly exceptional, and afforded no safe precedent.

We take it, that the brilliant Frenchman has touched the root of the matter. Ought women to learn the alphabet? There the whole question lies. Concede this little fulcrum, and Archimedeia will move the world before she has done with it; it becomes merely a question of time. Resistance must be made here or nowhere. *Obsta principis.* Woman must be a subject or an equal; there is no middle ground. What if the Chinese proverb should turn out to be, after all, the summit of wisdom,—“For men, to cultivate virtue is knowledge; for women, to renounce knowledge is virtue?”

No doubt, the progress of events is slow, like the working of the laws of gravitation generally. Certainly, there has been but little change in the legal position of woman since China was in its prime, until within the last dozen years. Lawyers admit that the fundamental theory of English and Oriental law is the same on this point: Man and wife are one, and that one is the husband. It is the oldest of legal traditions. When Blackstone declares that “the very being and existence of the woman is suspended during the marriage,” and American Kent echoes that her legal existence and authority are in a manner lost,—when Petersdorff asserts that “the husband has the right of imposing such corporeal restraints as he may deem necessary,” and Bacon that “the husband hath, by law, power and dominion over his wife, and may keep her by force within the bounds of duty, and may beat her, but not in a violent or cruel manner,” when Mr. Justice Coleridge rules that the husband, in certain cases, “has a right to confine his wife in his own dwelling-house and restrain her from liberty for an indefinite time,” and Baron Alderson sums it all up tersely, “The wife is only the *servant* of her husband,”—these high authorities simply reaffirm the dogma of the *Gentoo* code, four thousand year old and more:—“A man, both day and night, must keep his wife so much in subjection that she by no means be mistress of her own actions. If the wife have her own free will, notwithstanding she be of a superior caste, she will behave amiss.”

Yet behind these unchanging institutions a pressure has been for centuries becoming concentrated, which, now that it has begun to act, is threatening to overthrow them all. It has not yet operated very visibly in the old world, where (even in England) the majority of women have not yet mastered the alphabet, and can not sign their own names in the marriage-register. But

in this country, the vast changes of the last twelve years are already a matter of history. No trumpet has been sounded, no earthquake felt, while State after State has ushered into legal existence one half of the population within its borders. Every Free State in the American Union, except, perhaps Illinois and New Jersey, has conceded to married women, in some form, the separate control of property. Maine, Massachusetts, Connecticut, and Pennsylvania have gone farther, and given them the control of their own earnings,—given it wholly and directly, that is,—while New York and other States have given it partially or indirectly. Legislative committees in Ohio and Wisconsin have recommended, in printed reports, the extension of the right of suffrage to women; Kentucky (like Canada) has actually extended it, in certain educational matters, and a Massachusetts legislative committee has suggested the same thing; while the Kansas Constitutional Convention came within a dozen votes of extending it without reserve, and expunging the word *male* from the Constitution. Surely, here and now, might poor M. Maréchal exclaim, The bitter fruits of the original seed appear, and the sad question recurs, whether women ought ever to have tasted of the alphabet.

Mr. Everett, perhaps without due caution, advocated, last summer, the affirmative of this question. With his accustomed eloquence, he urged on the attention of Suleiman Bey the fact of the equal participation of the sexes in the public-school system of Boston, while omitting to explain to him that the equality is of very recent standing. No doubt, the eminent Oriental would have been pleased to hear that this public administration of the alphabet to females, on any terms, is an institution but little more than a half-century old in the city of Boston. It is well established by the early deeds and documents that a large proportion of Puritan women could not write their own names; and in Boston especially, for a hundred and fifty years, the public schools included boys only. In the year 1789, however, the notable discovery was made, that the average attendance of pupils from April to October was only one half of that reported for the remainder of the year. This was an obvious waste of money and accommodations, and it was therefore proposed that female pupils should be annually introduced during this intermediate period. Accordingly, school-girls, like other flowers, blossomed in summer only; and this state of things lasted, with but slight modification, for some forty years, according to the School-Superintendent's Third Report. It was not till 1828 that all distinctions were abolished in the Boston Common Schools; in the High Schools lingering far later, sole vestige of the "good old times," before a mistaken economy overthrew the wholesome doctrine of M. Sylvain Maréchal, and let loose the alphabet among women. * * *

It has been seriously asserted that during the last half-century more books have been written by women and about women than during all the previous uncounted ages. It may be true; although when we think of the innumerable volumes of *Mémoires* written by Frenchwomen of the seventeenth and eighteenth centuries,—each one justifying the existence of her own ten volumes by the remark, that all her cotemporaries were writing as many,—we have our doubts. As to the increased multitude of general treatises on the female sex, however,—its education, life, health, diseases, charms, dress, deeds, sphere, rights, wrongs, work, wages, encroachments, and idiosyncrasies generally,—there can be no doubt whatever, and the poorest of these books recognizes a condition of public sentiment which no other age ever dreamed of. * * * *

Ancient or modern, nothing in any of these discussions is so valuable as the fact of the discussion itself. There is no discussion where there is no wrong. Nothing so indicates wrong as this morbid self-inspection. The complaints are a perpetual protest, the defences a perpetual confession. It is too late to ignore the question, and once opened, it can be settled only on absolute and permanent principles. There is a wrong, but where? Does woman already know too much or too little? Was she created for man's subject, or his equal? Shall she have the alphabet, or not?

Ancient mythology, which undertook to explain everything, easily accounted for the social and political disabilities of woman. Goquet quotes the story from St. Augustine, who got it from Varro. Cecrops, building Athens, saw starting from the earth an olive-plant and a fountain, side by side. The Delphic oracle said, that this indicated a strife between Minerva and Neptune for the honor of giving a name to the city, and that the people must decide between them. Cecrops thereupon assembled the men, and the women also, who then had a right to vote; and the result was that Minerva carried the election by a glorious majority of one. Then Attica was overflowed and laid waste; of course the citizens attributed the calamity to Neptune, and resolved to punish the women. It was therefore determined that in future they should not vote, nor should any child bear the name of its mother.

Thus easily did mythology explain all troublesome inconsistencies. But it is much that it should even have recognized them, at so early an epoch, as needing explanation. When we ask for a less symbolical elucidation, it lies within our reach. At least, it is not hard to take the first steps into the mystery. There are, to be sure, some flowers of rhetoric in the way. The obstacle to the participation of woman in the alphabet, or in any other privilege, has been thought by some to be the fear of impairing her

delicacy, or of destroying her domesticity, or of confounding the distinction between the sexes. We think otherwise. These have been plausible excuses; they have even been genuine, though minor anxieties. But the whole thing, we take it, had always one simple, intelligible basis,—sheer contempt for the supposed intellectual inferiority of women. She was not to be taught, because she was not worth teaching. The learned Acidalius, aforesaid, was in the majority. According to Aristotle and the Peripatetics, woman was *animal occasionatum*, as if a sort of monster and accidental production. Mediæval councils, charitably asserting her claims to the rank of humanity, still pronounced her unfit for instruction. In the Hindoo dramas, she did not even speak the same language with her master, but used the dialect of slaves. When, in the sixteenth century, Francois de Saintonges wished to establish a girl's school in France, she was hooted in the streets, and her father called together four doctors learned in the law, to decide whether she was not possessed by demons, to think of educating women,—*pour s'assurer qu'instruire des femmes n'était pas un œuvre du démon*.

It was the same with political rights. The foundation of the Salic Law was not any sentimental anxiety to guard female delicacy and domesticity; it was, as stated by Froissart, a blunt, hearty contempt: "The kingdom of France being too noble to be ruled by a woman." And the same principle was reaffirmed for our own institutions, in rather softened language, by Theophilus Parsons, in his famous defence of the rights of Massachusetts *men* (the "Essex Result," in 1778): "Women, what age soever they are of, are not considered as having a sufficient acquired discretion [to exercise the franchise]."

In harmony with this are the various maxims and *bon mots* of eminent men, in respect to women. Niebuhr thought he should not have educated a girl well,—he should have her know too much. Lessing said, "The woman who thinks is like the man who puts on rouge, ridiculous." Voltaire said, "Ideas are like beards; women and young men have none." And witty Dr. Maginn carries to its extreme the atrocity: "We like to hear a few words of sense from a woman, as we do from a parrot, because they are so unexpected." Yet how can we wonder at these opinions, when the saints have been severer than the sages? since the pious Fénelon taught that true virgin delicacy was almost as incompatible with learning as with vice,—and Dr. Channing complained, in his "Essay on Exclusion and Denunciation," of "women forgetting the tenderness of their sex" and arguing on theology.

Now this impression of feminine inferiority may be right or wrong but it obviously does a good deal towards explaining the facts it takes for granted. If contempt does not originally

cause failure, it perpetuates it. Systematically discourage any individual or class, from birth to death, and they learn, in nine cases out of ten, to acquiesce in their degradation, if not to claim it as a crown of glory. If the Abbé Choisi praised the Duchess de Fontanges for being "beautiful as an angel and silly as a goose," it was natural that all the young ladies of the court should resolve to make up in folly what they wanted in charms. All generations of women having been bred under the shadow of intellectual contempt, they have of course done much to justify it. They have often used only for frivolous purposes even the poor opportunities allowed them. * * * Their use of science has been like that of Mlle. de Launay, who computed the decline in her lover's affection by his abbreviation of their evening walk in the public square, preferring to cross it rather than take the circuit,—"From which I inferred," she says, "that his passion had diminished in the ratio between the diagonal of a rectangular parallelogram and the sum of two adjacent sides." And their conception, even of Art, has been too often on the scale of Properzia de Rossi, who carved sixty-five heads on a walnut, the smallest of all recorded symbols of woman's sphere.

All this might perhaps be overcome, if the social prejudice which discourages woman would only reward proportionately those who surmount the discouragement. The more obstacles the more glory, if society would only pay in proportion to the labor; but it does not. Women, being denied not merely the antecedent training which prepares for great deeds, but the subsequent praise and compensation which follow them, have been weakened in both directions. The career of eminent men ordinarily begins with colleges and the memories of Miltiades, and ends with fortune and fame; woman begins under discouragement, and ends beneath the same. Single, she works with half-preparation and half-pay; married, she puts name and wages into the keeping of her husband, shrinks into John Smith's "lady" during life, and John Smith's "relict" on her tombstone; and still the world wonders that her deeds, like her opportunities, are inferior.

Every female common-school teacher in the United States finds the enjoyment of her two hundred dollars a year to be secretly embittered by the knowledge that the young college-stripling in the next school-room is paid a thousand dollars for work no harder or more responsible than her own,—and that, too, after the whole pathway of education has been obstructed for her and smoothed for him. These may be gross and carnal considerations; but Faith asks her daily bread, and Fancy must be *fed*. We deny woman her fair share of training, of encouragement, of remuneration, and then talk fine nonsense about her instincts and her intuitions,—say sentimentally, with the Oriental proverbial-

ist, "Every book of knowledge is implanted by nature in the heart of woman," and make the compliment a substitute for the alphabet.

(To be continued.)

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FOURTH MONTH 16, 1859.

History of the Institution of the Sabbath day—its uses and abuses, with notices of the Puritans, Quakers, &c. By WILLIAM LOGAN FISHER. pp. 248. T. B. Pugh, No. 615 Chestnut St.

We have received from the publisher a copy of this work, which exhibits much historical research, and though we are not prepared to adopt all the conclusions of the author, we think it worthy an attentive perusal. When we see the efforts which are making to establish the first day of the week as a *holy day*, and to cast those out of the pale of Christian fellowship who do not so regard it, there appears a necessity to hold up the testimony, and to give the reasons for conscientious dissent.

"As to consecrated days and times, we boldly testify against them as beggarly and Jewish," said Wm. Penn; and Robert Barclay, in his Apology, holds this language: "We, not seeing any ground in Scripture for it, cannot be so superstitious as to believe that either the Jewish Sabbath now continues, or that the first day of the week is the anti-type thereof, or the true Christian Sabbath." And again, says the same writer, "We know no moral obligation by the fourth commandment or elsewhere, to keep the first day of the week more than any others, or as having any holiness inherent in it." When we reflect on the benefits which would result from regarding the first day of the week as a *civil institution*, affording to all an opportunity of rest from labor, or of innocent relaxation, we know not that the assertion of the writer is too sweeping, that "those only who reject its ecclesiastical character are prepared to appreciate it as a civil institution."

The laboring classes, who need one day in seven for rest and relaxation, fail to derive the full benefit of the institution because of the sanctity and gloom which a mistaken view of its purpose has thrown around it.

Any one who has observed the crowds that assemble on First-days in our public squares and similar places accessible by walking, will be con-

vinced that daily toil from morn till eve for six successive days does not extinguish in the heart the love of green fields, of trees and falling waters. Might not this taste be taken advantage of, and more public provision be made by which the laboring man and his family should enjoy the beauties of nature on the only day which stern necessity allows them?

Were the efforts of the wise and good employed in this direction, it would aid the cause of good morals, and therefore of religion, more than all the zeal of sabbatarians.

The work contains historical notices of the Puritans and Quakers, contrasting the practice of the two sects, growing out of the views which each entertained upon this question, and this part of the volume is peculiarly instructive and interesting.

We propose making some extracts from the work.

MARRIED, according to the order of Friends, on Fifth day the 24th of 3d month last, at the house of her father, William Satterthwaite, Jr., HENRY W. STACKHOUSE to ANN SATTERTHWAITE, both of Bucks County, Pa.

—, According to the order of Friends, on Fifth day the 14th of 10th month last, at the house of her grandfather, Samuel Comfort, WILLIAM SATTERTHWAITE, to MARTHA C. WRIGHT, both of Bucks County, Penn'a.

—, On the 17th ult., at the residence of her father, Amos Jones, in Upper Makefield, Bucks County, Pa., by Friends' ceremony, WILLIAM G. COX to SARAH JONES.

DIED, Near Petersburg, York Springs, Adams Co., Pa., on the 1st of 4th mo., of cartarrh fever, EDITH, wife of Nathan Smith, in the 40th year of her age. She was an elder of Monallen Monthly Meeting for about two years previous to her death, which station she filled to the satisfaction of her friends. She was much beloved by all who knew her, many of whom will long mourn her departure.

For Friends' Intelligencer.

HISTORICAL SKETCHES AND REFLECTIONS.

BY S. M. JANNEY.

No. 4.

The ark rested upon the mountains of Arrarat, and after the waters had assuaged, Noah with his family went forth to cultivate and replenish the earth, to plant vineyards, to build cities, and to lay the foundation of empires. To them might be applied, as to our first parents, the language of the poet:

"The world was all before them where to choose
Their place of rest, and Providence their guide."

It appears to have been the design of Infinite

Wisdom in placing man upon the earth, that he should in successive generations spread over its surface, cultivate the soil, and govern the animal kingdom. We are informed that after the creation of the first human pair, God blessed them and said unto them, "Be fruitful, and multiply, and replenish the earth, and subdue it; and have dominion over the fish of the sea, and over the fowls of the air, and over every living thing that moveth upon the earth."

The natural resources and varied scenery of the globe are wonderfully adapted to supply the wants of man, to develop his intellectual faculties, and to furnish him with abundant evidences of wisdom of design on the part of Him who created and who sustains the universe. In order that this natural adaptation should have its full effect upon mankind, it was necessary that they should spread by migration, and thus being placed in different climates they would become dependent on each other for the comforts and conveniences of life.

There is, however, a social instinct implanted in the hearts of the whole human family, which leads them to seek society, and often induces them to congregate in masses. This feeling, when properly regulated, conduces to intellectual progress and enjoyment; but when it leads to an extremely dense population, and to the excessive growth of over-crowded cities, the consequences are often disastrous.

"Although true worth and virtue, in the mild
And genial soil of cultivated life
Thrive most, and may perhaps thrive only there;
Yet not in cities oft. In proud, and gay,
And gain devoted cities; thither flow,
As to a common and most noisome sewer,
The dregs and feculence of every land.
In cities, foul example on most minds
Begets its likeness. Rank abundance breeds,
In gross and pampered cities, sloth and lust,
And wantonness and gluttonous excess."

We may reasonably conclude that the descendants of Noah lived for many years in peace, under his patriarchal government; but about a century after the flood, they conceived the ambitious design to "build a city and tower whose top should reach to heaven," and the motive they avowed was, "to make themselves a name, lest they should be scattered abroad upon the face of the whole earth."

This presumptuous enterprise was frustrated by the confusion of tongues, providentially brought to pass, in order that they might be divided into nations, and by migrating in search for homes, fulfil the original design of their Creator.

This division, we are informed, took place in the time of Peleg, the fifth in descent from Noah, and the birth of Peleg was 101 years after the flood.*

Noah had three sons: from Japheth the eldest

proceeded the Germans, Gauls, Tartars, Greeks, Romans, and Muscovites. From Shem descended the Persians, Assyrians, Hebrews, Edomites and Arabians. And Ham was the progenitor of the Babylonians, Egyptians, Canaanites and Ethiopians. Other nations undoubtedly proceeded from these, both in the Eastern and Western hemispheres, but their descent cannot in all cases be traced with certainty.

That the eastern part of Asia was the cradle of the human race, is proved by the concurrent testimony of tradition and of the earliest records, both on monuments and in history.

Notwithstanding the great variety now exhibited in stature, color and features, among different nations, it is maintained by the most eminent philosophers, that there is only one human species, which accords with the Mosaic account, and with the declaration of the apostle Paul, that "God made of one blood all nations to dwell on the face of the earth."

Man is not the only creature exhibiting a great variety in form, size and color; for we find fully as great a diversity in other animals, which we know is the result of climate, food and treatment. It is remarked by the great geographer, Malte Brun, that "every person knows that a simple mode of life, abundance of nutritious food, and a salubrious atmosphere, give to all organic beings large and graceful forms. The example of the Laplanders and Hungarians, whose language indicates their common origin, and who differ extremely in stature and in physiognomy, sufficiently proves that the beauty of the same race varies with the climate and the qualities of the country." The same writer observes that "variety of color seems equally to depend upon external circumstances. In the same nation we often observe individuals of extremely different complexions. While the Moorish ladies, shut up in their houses, and scarcely ever exposed to the sun, have complexions of dazzling whiteness, the women of the lower ranks, even in their youth, acquire a color approaching to that of soot. The Abyssinian mountaineers are as fair as the Spaniards or the Neapolitans, whilst the inhabitants of the plains are almost black."

The European race, usually called the Caucasian, is undoubtedly the best developed and most beautiful in form, as well as the most advanced in civilization. And it is remarkable that in the countries bordering on the Caucasian mountains, the very region where the human species originated, a people now live who in form and feature are considered models of beauty. Hence it has been concluded, that in those countries, where the inhabitants are dwarfed in size, or deformed in their features, the deterioration has been produced by a scarcity of food, great hardships, or long continued oppression.

Hugh Miller, in his autobiography, mentions a class of people in Scotland, who until the year

* Genesis x. 25; xi. 10, 18.

1799, were slaves in the coal pits near Edinburgh, and who, after their emancipation, still bore the marks of degradation in their features. "The collier women of this village," he writes, "poor overtoiled creatures, who carried up all the coal from under ground, on their backs, by a long turnpike stair inserted in one of the shafts, bore more of the marks of serfdom still about them than the men. How these poor women did labor, and how thoroughly, even at this time were they characterized by the slave nature! They were marked by a peculiar type of mouth, from which I learned to distinguish them from all the other females of the country. It was wide, open, thick-lipped, projecting equally above and below, and exactly resembled that which we find in the prints of savages, in their lowest and most degraded state.

The same author, in his Testimony of the Rocks, quotes from an Irish author an account of the degradation produced by extreme suffering, on a portion of the Irish people, who were driven from their homes after a rebellion. The descendants of these exiles, he says, are now distinguished physically by great degradation. They are remarkable for open, projecting mouths, with prominent teeth, and exposed gums, and their advancing cheek bones and depressed noses bear barbarism on their very front. In Sligo, and northern Mayo, the consequences of two centuries of degradation and hardships exhibit themselves in the whole physical condition of the people, affecting not only the features, but the frame. Five feet two inches on an average, pot bellied, bow-legged, abortively featured, their clothing a wisp of rags; these spectres of a people that were once well grown, able-bodied and comely, stalk abroad into the daylight of civilization, the annual apparition of Irish ugliness, and Irish want.

With such testimonies as these, and many more that might be adduced, there can be no difficulty in accounting for the most striking difference of form, feature and color, in the human species, without resorting to the hypothesis, lately advanced in this country, which, discrediting the Mosaic account, assumes that the various types of mankind have sprung from different stocks originally created distinct.

One more testimony in favor of the unity of the human species I will introduce from the Cosmos of Humboldt, an author who stands pre-eminent among men of science. The different races of mankind, he says, "are forms of one sole species." "While we maintain the unity of the human species, we at the same time repel the depressing assumption of superior and inferior races of men. There are nations more susceptible of cultivation, more highly civilized, more ennobled by mental cultivation than others, but none in themselves nobler than others.

"All are in like degree designed for freedom,

which, in the ruder conditions of society, belongs only to the individual; but which in social states, enjoying political institutions, appertains as a right to the whole body of the community.

"If we would indicate an idea which throughout the whole course of history has ever more and more widely extended its empire, or which more than any other testifies to the much contested and still more decidedly misunderstood perfectibility of the whole human race, it is that of establishing our common humanity, of striving to remove the barriers which prejudice and limited views of every kind have erected among men, and to treat all mankind, without reference to religion, nation or color, as one fraternity, one great community, fitted for the attainment of one object, the unrestrained development of the physical powers." To this noble testimony I would add, that not only the physical but the intellectual powers, and still more the moral faculties, should be developed and brought under the government of divine grace, in order that man may attain to that dignity and happiness which were designed for him by our beneficent Creator.

From the Boston Courier, 18th.

THE STUDY OF NATURE.

LECTURE BY PROF. AGASSIZ.

Last evening another of the series of Educational Meetings was held in the Representatives' Hall, at the State House. The subject of discussion was, "training of the young, from their earliest years, to observe and study the works of God in Nature, as among the best means of disciplining the intellectual faculties and enriching them with knowledge, and also of exalting the heart toward the Creator." Professor Agassiz said:

Ladies and Gentlemen,—I have been invited to address you this evening, upon the subject of an Early Study of Nature, as a means of developing the faculties of the young, and of leading them to a knowledge of the Creator. I wish to awaken in you the conviction that the knowledge of nature in our days is at the very foundation of the prosperity of States; that the study of the phenomena of nature are among the most potent means of developing the human faculties; and that on these accounts it is highly important that that branch of education should be introduced in our schools as soon as practicable. To satisfy you how important the study of nature is to the community at large, I need only allude to the manner in which, in modern times, man has learned to control the forces of nature and to work up the materials which our earth produces. The evidence of the importance of that knowledge for the welfare of man is everywhere open before us; and that there is hardly any training better qualified to develop the highest faculties of man, can I allude to a better evidence than to

that venerable old man, Humboldt, who is the embodiment of the most extensive human knowledge in our days, and who has acquired that position, and who has become an object of reverence throughout the world, merely by his devotion to the study of nature? If that be true, then, that a knowledge of nature is so important for the welfare of States, and can train men to such a high position among men by the development of their best faculties, how desirable that such a study should form a part of all education. I believe that the introduction of the study of natural history as a branch of the most elementary education is what can be added to our already admirable system. The only difficulty is to find teachers equal to the task, and the task is no small one. For, in my estimation, the elementary instruction is the most difficult of all. It is much easier to deliver a lecture to a class of advanced students than to take up the young and teach them the elements. And I believe it is still a mistaken view with many that a teacher is always sufficiently prepared to impart the first elementary instruction to those intrusted to his care. I think nothing can be further from the truth, and that, intrusting the instruction of the young in their first beginnings to incapable teachers, we lose frequently the opportunity of unfolding the best minds to the highest capacities, by not attending at once to their wants. A teacher should always be far in advance of those he teaches, and there is nothing more painful than to be obliged to repress those embarrassing questions which the pupils may make, and which may be beyond your reach. A teacher who crams the day before that which he teaches the next day is never up to his task. He must be capable of facing his class with a consciousness that he is fully competent to instruct in that which is the task of to-day, and to answer any question that may be asked about that which is before him. Not only that, but he should feel capable of fostering these questions, of suggesting them, of rendering his whole class so inquisitive, so desirous of being taught, that there should be no limit to the amount of accessory information which he can give beside the repetition of the task assigned for to-day. And it is only the teacher who is far advanced beyond his class who can do that. He who is only equal to his task is not to be entrusted with such an important trust. He must be able to instruct so that the information which he gives at the time may become connected with that which the pupil is to learn afterward; and so I say that the teachers of the elementary school should be selected from among the ablest. They should be the best teachers. They should be capable of rendering the study attractive, interesting, and so pleasant, indeed, that the hour for the school should be the hour expected with anxiety by the scholar, instead of the hour dreaded as bringing something imposed by duty, and

not desirable in itself. This is particularly the case with reference to the study of natural history. The teacher who would undertake successfully to teach the elements of that science, must be so far advanced that he knows how to select those topics which are particularly instructive, and best adapted to awaken the interest, to sustain it, and to lead forward to the understanding of more difficult questions. But it is not only in the study of natural history that it is desirable to have good teachers. I say that even to teach the A, B, C, or how to read and write, a teacher should know a great deal. And I can see that it requires that inexhaustible thirst for knowledge which is imparted to human nature to have children sustain their interests in study when the elements are imparted to them in the manner in which they are imparted. Can you conceive anything more dry and less attractive than the learning of the twenty-four signs which are called letters, and of combining of them into syllables and then into words—and all in the most mechanical and hum-drum-way, as if there was no sense in it? Yet there is a deep sense in it, and there is in every series of letters materials for the most attractive and the most instructive information, if it was in the heads of the teachers. Let them show how men have learned to write their thoughts in words; how, after writing was invented, in what way it was used in the beginning, how it has been shortened into the abbreviations made use of to write words as they fall from the speaker's lips, and which are read with as great certainty as if the writer had them before him already written, and had only to copy them; and then the children will be eager to learn them, and be ready to avail themselves of the advantages which they possess. But I say that in order to create that interest in them they ought not merely to be taught mechanically that such a figure is A, and that another is B, and another is D, and so on, but they ought to be shown how men came to think of writing; they ought to be shown that writing, or the letters, are only symbols to express thoughts, and that the earliest and simplest ways of recording those thoughts was to represent the object to the eye. Let a class of children be before their teacher, and let the teacher ask them how they would convey to others what they have in their minds. Let him ask how they would convey an idea of what they had seen during the day. They go along the street, they have seen houses, and trees, and wagons, men, women, and children; and now let them, the very first day that they go into school and sit on the benches, attempt to represent what they have seen. Let them all be called upon to make figures of what they have seen. They have seen trees, and let them represent a tree, and while they make that attempt, let the teacher tell them what different kinds of trees there are, and

the difference which exists between trees; let him explain that there is a variety of trees, and let him represent the elm, for instance, or the pine, for the elm has a characteristic branch so peculiar that it can never be mistaken for a pine, and then again, the maple will be represented in a way entirely different from either the pine or the elm, arising from the very nature of the tree. On another day, let some implement of the household be brought forward and its parts analyzed and represented in the same manner, and when they have been drawn accurately and minutely, and copied on the slate, let them be represented, as it were, in short-hand, by a figure which will come in the simplest outline nearest the object it was meant to represent. And in course of time, the pupils will have collected thousands of different images representing things with which they have become acquainted, all of which will be familiar to them; and being called upon to represent one of those objects, they will readily make signs therefor; and as they advance in that way it will be found that the signs have become so numerous that it is trying to have so many things recorded; and then will be the time to show the children that this can be done in a more expeditious way—that we need not, in order to record all the things with which we are familiar, to have as many signs as there are different things; but that everything has a name, and having received a name, instead of recording the thing itself, we may record the name. We may record the sound of which we express the thing, and to record the sound we may agree to let one of these signs which we use for elm represent a part of the sound of elm—the E; we may use one of the signs by which we represented the maple or a part of the sound of maple—the M; we may use one of the signs for representing the pine to signify a part of the sound of the word pine—the P; and then we can combine these signs so as to represent the sounds with which these objects are designated. That is the way in which the letters were invented. The letters we use now may be traced back to Phœnicia; they are in imitation of the hieroglyphics of Egypt, and if the teachers only knew them they would know at once that these three letters which we read b-a-g are only a representation of signs made in the manner in which these signs were made by the Phœnicians nearly thirty-five hundred years ago. They were borrowed by the Phœnician merchants from the Priests of Egypt, and then carried in their business transactions all over the eastern world, and came down through the Greeks in our alphabet. Would not such things interest a child? Would they not very soon learn their A, B, C, and while learning it, learn a great deal more which would be useful in their lives afterward? And what may be done for the A, B, C, ought to be done in every branch of study! It ought to be done in the

study of astronomy, it ought to be done in the study of geography, it ought to be in the study of natural history. A mistake in our elementary education is that we teach everything in the same way. We resort to books, as if everything was to be learned from books, and from books alone. I will speak from personal experience. I have been a teacher since 15 years of age, and I am a teacher now, and I hope I shall be all my life. I do love to teach, and there is nothing so pleasant as to be placed in a position to develop the faculties of my fellow-beings who, in their early age, are intrusted to my care; and I am satisfied that there are branches of knowledge that are better taught without books than with books, and there are some cases where it is so obvious that I wonder why it is always to books that teachers resort when they would teach some new branch in their school. When we teach music we do not learn it by heart or commit it to memory, but we take an instrument and learn to play it. When we study natural history, instead of books let us take specimens, stones, minerals and crystals. When we would study plants let us go to plants themselves, but not to books describing them. When we would study animals let us have animals before us, and not go to books in which they are described. In geography let us not resort to books, but let us take a class and go out into the field, and point out the hills, valleys and rivers, and show them what are accumulations of water and expanses of land; and then, having shown them that, let us bring representations of what they are to learn, that they may compare them with what they know, and the maps will have a meaning to them. Then you can go on with the books, and they will understand what these things mean, and will know what is North and East and South, and will not merely read the letters N. E. S. W. on a square piece of paper, thinking that England and the United States are about as large as the paper they learn from. When I was in the College of Neufchatel, I desired to introduce such a method of teaching geography. I was told it could not be done, and my request to be allowed to instruct the youngest children in the Institution was refused. I resorted to another means, and took my own children—my oldest, a boy of six years, and my girls, 4½ and 2½ years old, and invited the children of my neighbors. Some came upon the arms of their mothers; others could already walk without assistance. These children, the oldest only six years old, I took upon a hill above the city Neufchatel, and there showed them the magnificent peaks of the Alps, and told them the names of those mountains, and of the beautiful lakes opposite. I then showed them the same things on a raised map, and they immediately recognized the localities, and were soon able to do it on an ordinary map. From that day geography was no longer a dry study, but a desir-

able part of their education. You may do the same in astronomy. You may use the lamp in the room to show them how a body illuminated may cast its light on others, and how the side opposite is in darkness. Let the teacher turn about in front of the light, and he will show that light is shed on any part of his body as he presents it, and in that way he can teach a child of four years the relative position of the earth and sun. You can go further, and show the complicated motion of the moon, simply by showing them that while you turn around yourself, a piece of paper which you hold may also turn around you, always presenting the same face to you, while you radiate about the central light which represents the sun; and in that way the whole movement of the solar system may be explained in a pleasant manner to the youngest child.

(To be continued.)

QUIETUDE.

"If He giveth quiet, who shall make trouble?" Job xxxvi. 29.

QUIET from God! It cometh not to still
The vast and high aspirings of the soul;
The deep emotions which the spirit fill—
And speed its purpose onward to the goal;
It dims not youth's bright eye,
Bends not joy's lofty brow;
No guiltless ecstasy
Need in its presence bow.

It comes not in a sullen form, to place
Life's greatest good in an inglorious rest,
Through a dull, beaten track its way to trace,
And to lethargic slumber lull the breast:
Action may be its sphere,
Mountain paths—boundless fields,
O'er billows, its career:
This is the power it yields.

To sojourn in the world, and yet apart—
To dwell with God, yet still with man to feel;
To bear about forever in the heart
The gladness which His Spirit doth reveal;
Not to deem evil gone
From every earthly scene;
But see the storm come on,
And feel His shield between.

It giveth not strength to human kind,
To leave all suffering powerless at its feet,
But keeps, within the temple of the mind,
A golden altar and a mercy-seat;
A spiritual ark,
Bearing the peace of God,
Above the waters dark,
And o'er the desert's sod.

How beautiful, within our souls, to keep
This treasure the All-Merciful hath given;
To feel when we awake, and when we sleep,
Its incense round us, like a breeze from heaven!
Quiet at hearth and home,
Where the heart's joys begin—
Quiet where'er we roam,
Quiet around, within.

Who shall make trouble?—Not the evil minds
Which, like a shadow, o'er creation lower,
The spirit, peace hath so attuned, finds
There, feelings that may own the Calmer's power;

What may she not confer,
E'en where she must condemn?
They take not peace from her,
She may speak peace to them.

What shall make trouble? Not an adverse fate,
Not chilly poverty, nor worldly care:
They who are tending to a better state,
Want but that peace, to make them feel they are.
Care, o'er life's little day,
The tempest cloud may roll;
Peace, o'er its eve, will play
The moonlight of the soul.

Who shall make trouble?—Not the holy thought
Of the departed—that will be a part
Of those undying things which peace hath wrought
Into a world of beauty in the heart:
Not the forms pass'd away,
Which time's strong current bore,
The dark stream might not stay,
The ocean will restore.

Selected.

CHEER EACH OTHER.

Yes, cheer one another along,
In paths which ye ought to pursue—
A word to dishearten is wrong
To those who are striving to do.
Speak cheeringly unto the sad,
The wounded in heart, and the poor,
A word of affection makes glad,
And helpeth the wrong to endure,
Deal gently with others that err—
'Tis mercy that smeth the lost—
And all that thy love may confer
Can never God's bounty exhaust.
Oh, cheer one another along
And joy and affection impart—
Unkindness of spirit is wrong,
But bless'd are the cheerful of heart.

TRIALS OF RICH MEN'S SONS.

The rich man's son is often envied by those who know not the peculiar trials which he is called upon to endure. He alone can tell them who has felt the falseness of the position which he occupies. Though only an heir expectant, he is called upon to act as if he had actually come into possession. He thereby suffers the inconveniences of wealth without its advantages.

He commences business by the side of one who is not *blessed* with a rich father. Often he brings with him a far greater amount of business talent, knowledge and energy than his competitor. The latter can afford to be frugal, and live in a quiet corner, devoting all his energies to his business or profession, having few or no social friends making demands on his time. If he is successful, and acquires property rapidly, no one knows it only so far as he chooses to let it be known, until he has accumulated such an amount as to render secrecy no longer desirable.

But the rich man's son fares differently. His mode of living is just that of his father, or else he is called mean. Thus he feels impelled to do something toward maintaining the family dignity.

He has a numerous circle of friends to entertain. Because he is thoroughly respectable, his society is much courted. He is ambitious, and many of those hours which he is anxious to devote to business and mental improvements he feels called upon to spend in formal visiting, or else give offence, which both his kind disposition and education forbid him to do. He is a mark for every soliciting agent, and is expected to do something worthy of himself and his position. In vain he speaks the truth, and calls himself poor; this is seldom believed, but interpreted as an evasion. Give he must. He is constantly told, "If I were as rich as you, I would do so and so." He sees that his profits and expenses are disproportionate, and that any adverse change in business would prove his ruin, because he lays little or nothing by for reverses. In secret he grieves over his affairs, and wishes they were different, but how to improve them he knows not.

Thus he lives on this life of torture for years, constantly hoping to extricate himself from the difficulties which environ his steps, but every plunge only sinks him still deeper. Not unfrequently the property which, in the course of events, he felt sure would fall into his hands, owing to some endorsements or unfortunate speculation of his parent, is swept away, and his bright expectations are in a moment blighted. His family increases, and with it his expenses. To retrench is humiliating, to go forward is bankruptcy. His politeness forbids him to intrude his sorrows upon others, and to his friends he smiles as cheerfully as if unoppressed by anxieties. Thus he lives from day to day, striving with manly courage to bear up under the growing pressure, till suddenly he is hopelessly bankrupt. Instead now of meeting with a generous sympathy, he receives the cold shoulder, and his acquaintances exclaim, "who would have thought it?" "Why! there is his competitor, commencing at the same time, with little or nothing, who has accumulated a fortune, while he, with all his advantages, has failed. There is nothing like self-made men, after all." Yes, so it is. The one has saved himself rich, while the envied advantages of the rich man's son has made him a bankrupt.—*N. Y. Recorder.*

LOOK AT THE BRIGHT SIDE.

People should consider that most of those living things for which they have conceived a horror, are in themselves beautiful, and should be objects of our admiration. We believe there is not in the whole creation a thing that can properly be called disgusting. It may be troublesome and annoying if it obtrudes itself where comfort and cleanliness forbid its entrance, and may justly be removed, or, if necessary destroyed. But, in themselves, both insects and reptiles are most curiously and exquisitely wrought; and,

instead of shrinking from them with senseless horror, we may accustom ourselves to look at them with sensations of pleasure. It is, to some persons, and might be to all if they would cultivate the feeling, a source of infinite delight to watch the swarms of insects that people the whole creation in the midday of a summer sun. There are those who receive as much pleasure from the insect that settles on their finger as from the wild flower that blossoms under their feet. This complacent feeling in the contemplation of nature's living works, and that of persons who shrink from them in disgust, are merely habits of mind; the one may just as well be cultivated as the other.

From the Saturday Evening Post.

RAINY DAYS.—A TRUE SKETCH.

The day is cold, and dark, and dreary;
It rains and the wind is never weary;
The vine still clings to the mouldering wall,
But at every gust the dead leaves fall,
And the day is dark and dreary.

Longfellow.

That may do for a poetical conception very well, but I wonder if Mr. Longfellow was ever shut up in a house with seven children, through the long hours of a rainy day! I fancy it would give him more practical ideas upon the subject than he ever before cherished.

Of these said seven children, the three little girls are not much trouble, there being implanted in the feminine heart, from an early age, a vast amount of self-respect—sometimes called vanity—which acts as a kind of moral check-rein in keeping the little ones in order. But there are those three terribly active, energetic boys, to be amused and kept within rational bounds, and the baby, poor little unfortunate, who is expected to sleep through all the noisy day. No wonder mamma looks with dismay upon the bright little faces that surround the breakfast-table.

Ned—the very embodiment of mischief—is already making a proposition to his next younger brother,—a very little boy, with a very large head, and who is generally known in the family as "Fatty"—to play at "butcher" after breakfast, to which the deluded Fatty yields a ready consent.

As a pleasant commencement to this day of disorder, Charley, the little three-year old, tumbles down stairs whilst mamma is washing the breakfast things, and in so doing acquires a lump on his head that would puzzle a phrenologist, and which fairly casts the bump of caution into the shade. By successive applications of arnica, oil, lumps of sugar, and the story of The Three Bears, Charley is restored to good humor, and the mother of the family applies herself to the soul-cheering occupation of darning stockings;

but the work is destined to interruption, for cries of distress are heard to issue from the bath-room, and upon investigation Fatty is found lying in the tub (fortunately not full of water,) where the amateur butcher, Ned, has just left him tied hand and foot. The culprit is summoned to receive a reprimand from his indignant mother, whom he disarms at once by innocently explaining.

"Why, mamma, Fatty is my calf, and I had just killed him, and left him to bleed in the slaughter house, until I was ready to cut him up."

The scolding that was to be, ends in a laugh, and Ned proclaims his triumph in a series of gymnastic performances on the floor and over the sofa, in which he does everything but swallow himself, winding up with a back-handed somerset that overturns mamma's work-table, and creates universal havoc. The mother is too well accustomed to these little accidents to lose temper, but on the contrary is rather glad of it, as the picking up of spoons, scissors, etc., will afford some occupation to her sadly restless boy. It is but temporary, however, and Ned goes off whistling "Pop Goes the Weasel" so loudly that baby is awakened thereby, and comes down to mamma, whilst nurse performs some household duty. What a never-ceasing fascination there is about the baby! Each child is clamorous for the sole and entire charge of him, and so he is hugged and kissed and pulled and jostled, until, good-natured baby as he is, he is driven to yelling in self-defence, and refuses to be comforted until a cake makes its appearance. This, of course, excites the hunger always lying latent in the childish stomach, and cakes become a universal panacea. The little girls, in order to prolong and enhance the enjoyment of the eating, have a "party," and after having asked for and obtained a number of little accompaniments to to the *place de resistance* of the feast, they get fairly under way. But now comes a messenger to complain of Charley's gormandizing propensities. He keeps asking for cake all the time, and you know, mamma, it isn't good for such little children, says his early ripelittle sister, his senior by one year. Charley is finally managed by being granted a table and party all to himself, by his much enduring mother. But meantime all these little frets and jars have so worked upon my old maid nervous system, that in order to preserve my temper, I put on a wet weather costume and start for a walk, thanking my stars that the management of seven children does not come within my range of duty.

"THEIR FOOT SHALL SLIDE IN DUE TIME."

Deut. xxxii. 35.

"I have trusted also in the Lord, therefore I shall not slide."—Ps. xxvi. 1. "The law of his God is in his heart; none of his steps shall slide. But as for me, my feet were almost gone;

my steps had well-nigh *slipped*."—Ps. lxxiii. 2. These texts are strikingly illustrated in the following narrative of a missionary in Northern Hindostan, Joseph Warren: "During my journey in the Himalayas, I was often reminded of these and other similar passages of Scripture. The mountain roads are very narrow. They are not often wide enough for more than two men to walk together, and we generally find it easier to follow in single file. I never saw the men who carry loads walking two abreast. There are ascents and descents so steep as to require the traveller to plant his foot firmly and carefully, in order to prevent his falling—*sliding*—down the hill. In some places the road leads around the side of the mountain, or along the bank of a torrent, with a precipice either perpendicular, or nearly so, immediately on one side of it, of hundreds of feet in height. Sometimes the sharp ascent or descent is combined with the precipice on one side; and a further complication of the difficulty is made by both a slope of the road towards its outer edge, and a chalky or friable kind of stone in the pathway, affording no safe hold to the feet. In many of these places, the traveller looks down a giddy slope of a hundred, a thousand, or two thousand feet, on which no foothold could be found; with the consciousness that a false step, or a breaking of the bank under his feet, would precipitate him into the ravine below, without his having the least ability to prevent the catastrophe. Once, when riding along the bank of a ravine filled with stones, I came to a place where the bank above the road had slipped down and filled the pathway, excepting about eight inches at the outer edge. As the ravine was not very deep, and therefore did not look nervous, I rode around the heap, and my horse's hind feet broke down the remainder of the pathway. He carried me safely over, however, but I could not help repeating to myself the words quoted at the head of this article: 'My steps had well-nigh *slipped*.' A great part of the wilderness in which the children of Israel journeyed is mountainous; so is the greater part of Judea. The figures derived from this fact are very expressive. No one can *feel* their full meaning, unless he has had some experience of mountain paths."—*Presb. For. Miss.*

ITEMS OF NEWS.

Daniel Webster, an alleged fugitive slave, was arrested in Harrisburg on the 2d inst., upon a warrant issued by Commissioner Longstreth, and brought to Philadelphia for trial. The investigation of the case occupied two days and one entire night; but the Commissioner thinking the evidence of identity insufficient, released the fugitive.

GUANO.—According to a letter received from Lieutenant Brooks, (commanding the United States schooner Fenimore Cooper,) who is now engaged in surveying a route between San Francisco and China and Japan, the guano island taken possession of by him contains at

the lowest calculation 25,000 tons of guano. The results of the survey thus far, notwithstanding the smallness of the outfit are regarded of high value to our commercial name.

HAYTI.—The Haytien journals contain a curious recital of the sitting of the Senate at Hayti, in which Gen. Geffard took the oath as President. The gold crown of the Ex-Emperor was placed upon the table, and the new President, taking a little hammer in his hand, said he would not break the bauble—that would be an act of vandalism—but he would give it three "symbolical" strokes, after which it should be placed in the public treasury, "where it would be appreciated at its proper value." This was accordingly done, and the President retired amidst the acclamations of the Assembly.

MAPLE SUGAR.—The yield of maple sugar in Michigan has been so extraordinary this season, that farmers are selling it for from six to eight cents per pound. More sugar has been made in the western counties of Pennsylvania this season than for many years past.

SLAVERY.—The Havana correspondent of the *Savannah Republican* writes: During the years I have resided in this Island, the average annual number of Africans imported has been about eight thousand. Last year, however, that number was nearly trebled—*twenty-three thousand* having been imported.

The slave traffic is growing at the South. The *Weldom* (N. C.) *Patriot* says that 2,000 negroes passed through that place in 1st mo and less than 50,000, it is informed, went into the cotton region during the last year.

The revenue cutter McClelland has been ordered to the coast of Louisiana to intercept a suspected tender to a slaver said to be waiting off that coast to land a cargo of Africans.

PACIFIC RAIL ROAD.—A bill has passed the Missouri Legislature, giving one million and a half of dollars toward the completion of the Pacific Railroad, whenever a like sum is subscribed and the money expended on the road. Bills are pending to give the Platte county Railroad \$750,000, the Iron Mountain Railroad \$1,500,000, and also to aid the North Missouri Railroad, all of which will probably pass.

COOLIES.—The whole number of coolies introduced into Cuba thus far is upwards of 37,000. The Cubans fear their future influence, as they are much more intelligent and far less tractable than negroes.

Dr. ELIZABETH BLACKWELL is delivering a course of lectures in London, on the value of Hygienic and Medical Knowledge to Women.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is inactive, and prices are unchanged. We quote sales of superfine Flour at \$6 25 per bbl., and \$6 37 a 6 62 for extra family. The sales to the retailers and bakers are within the range of the same figures, and fancy lots at from \$6 75 to 7 50. Sales of Rye Flour and Corn Meal continue limited. The former at \$4 25 per bbl. Corn Meal is held at \$3 87.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 53 a 1 56 per bushel for fair and prime red, and \$1 62 a 1 70 for white in store. Rye is less active and sells at 87 cts. Corn is in demand; sales of yellow at 88 cts afloat. Oats are steady; sales of prime Pennsylvania at 54 cts., and Delaware and Jersey at 53 cts. Sales of 2,000 bushels of Barley and Malt at \$1.

GLOVERSEED sales at \$5 25 a 5 50 per 64 pounds for fair and good quality, and \$5 75 a 6 from second hands. No further sales of Timothy or Flaxseed.

HIGHLAND DALE.—Charles and Catharine Foulke inform their friends that their house will be open for the reception of boarders, early in the 6th month. It is an elevated situation, one mile from Stroudsburg, and four miles from the Delaware Water Gap.

The cars leave Walnut Street wharf every morning for Stroudsburg.

The price of board in 6th and 7th months, will be \$6 per week, and in the 8th month, \$7 per week. Children under 12 years, half price.

4th month, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next session of this Institution, on the 2d of 5th mo. next. For reference and further particulars, enquire for circulars of Principal,

BENJAMIN SWAYNE.

London Grove, 22d of 3d mo., 1859.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON, } *Assistants.*

MAGGIE B. JACKSON, }

Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER, } *Proprietors.*

SUSANNA G. CHANDLER, }

3d mo. 19, 1859.—10 t.

ELDRIDGE'S HILL BOARDING SCHOOL FOR THE EDUCATION OF YOUTH OF BOTH SEXES.—All the branches of a liberal English Education are thoroughly taught in this Institution. Also the French and Latin languages.

The summer session will open on the 3d of 5th mo., 1859, and continue 20 weeks, terms \$70 per session.

For full particulars address the Principal for a circular.

ALLEN FLITCRAFT,

Eldridge's Hill, Salem County N. J.

2 mo.

ORANGE GREEN BOARDING SCHOOL FOR GIRLS.—The Summer Term will commence on the 11th of 4th month next. The location is unusually healthy and pleasant; the course of study extensive and thorough. Terms Thirty-six Dollars per session of thirteen weeks.

For particulars, address Principals,

SIDNEY PUSEY, or

FANNY A. KINSEY.

Kennett Square, Chester Co., Penna.

2d mo., 1859.—2m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FOURTH MONTH 23, 1859.

No. 6.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A Testimony from the Monthly Meeting of Hardshaw-East, concerning JOHN THORP, deceased.

Our beloved friend, John Thorp, was born at Wilmslow, in the county of Chester, the 5th of the 11th month, 1742, according to the N. S. His parents were in profession with the church of England. His father dying before he was born, the care of his education, with that of several other children, devolved on his mother, who, we have reason to believe, was a sober, well-minded woman, for whom he retained an affectionate and honorable esteem.

We have but little information respecting his conduct when a boy, except that, at a very early age, he became a singer in that called the parish church at his native place, an exercise which he was then strongly inclined to; but being soon after favored with a visitation of "the day-spring from on high," he believed it to be required of him to relinquish this practice, in which he had taken great delight; and during a season of distress and mental retirement from the world, it pleased the Father of mercies, by the secret operations of his Divine Power, to open to his mind the nature and spirituality of the gospel dispensation; and to convince him that the saving knowledge of God is only to be attained by the immediate revelation and inspiration of the Holy Spirit.

Some time after, he began to attend the meeting of Friends at Morley, about two miles distant from the place of his birth. This he did in a way to be as little observed as possible. There he found, publicly professed and advocated, the important doctrines which had been so clearly, and, as he has since declared, so immoveably impressed on his mind.

Continuing to attend the meetings of Friends,

and feeling unity with them, he was, in the twentieth year of his age, admitted into membership. The following year he removed to London, where he continued to reside about four years, and, in the year 1767, he removed to Manchester, settled there, and not long after entered into the married state.

For some years after his admission into our Society, he had to pass through much deep exercise and spiritual conflict, finding in himself that he was opposed to that state of humble resignation which had been, by the Divine light, so clearly opened to his view, as necessary to be attained; but, through the powerful and effectual operation of the grace of God, he was enabled to take up his cross, to follow Christ in the regeneration, and to experience a preparation for that work and service in the church whereunto he was appointed.

About the thirty-second year of his age, he appeared in the work of the ministry. He was naturally a man of strong mind and a comprehensive understanding; and being faithful to the gift received, he became an able and powerful minister of the gospel, reverently careful to wait for the renewed openings of the Word of Life; so that we believe it may be truly said of him, that, when he ministered, he did it of the ability which God giveth, approving himself a workman that needeth not to be ashamed; rightly dividing the word of truth; faithfully warning the careless and worldly-minded of their danger; encouraging the sincere and upright-hearted; and, to the mourners in Zion, he was indeed a "son of consolation;" and, through the Divine blessing, his labors were made instrumental to the spiritual advantage of many.

His labors in the work of the ministry were mostly confined within the compass of his own Quarterly Meeting and his native county; except that he several times attended the Yearly Meeting in London, and twice visited the meetings of Friends in the metropolis and its neighborhood, the latter time returning by way of Bristol. He several times visited the families of Friends in his own meeting, a service for which he was well qualified.

He was frequently concerned to testify, that the way to the kingdom of heaven, is the way of humility, of self-denial, and the cross; the way which the Captain of our salvation hath trodden before us and sanctified. In this re-

spect our beloved friend was an eminent example; being early and deeply convinced of the danger of seeking for the treasures and possessions of this world, he was content to remain in a comparatively low station. That he might not be unnecessarily encumbered with the cares of this life, and that he might be more at liberty for the service of his Divine Master, he steadily declined, at a time when he had an increasing family, the earnest and repeated solicitations of some of his near relations to enter into more extensive business; yet he was favored to experience the gracious promise of our blessed Lord fulfilled, that to those who seek first the kingdom of God and His righteousness, all things necessary shall be added.

He was greatly and generally beloved; and among his more intimate friends, his natural cheerfulness, tempered with Christian gravity, his deep experience and sound judgment in Divine things, rendered his conversation peculiarly interesting, instructive and edifying.

In the autumn of 1815 he was visited with a slight attack of the paralytic kind, by which his powers of body and mind were in some degree impaired; yet he was diligent in attending his own meeting, and was much pleased with the company of his friends, to whom his conversation continued to be interesting and edifying, clearly evincing his concern for the welfare of the church, and that his mind was centered in Divine Love.

About a week before his decease, he was seized with a severe spasmodic affection. At this time he manifested great composure of mind, saying that, whichever way it might terminate, all would be well. Continuing in a state of patient resignation, as one having done his day's work, and waiting for his Master's call, being supported by that faith and confidence in the mercy of God through our Lord Jesus Christ, which he so feelingly described some time before in a letter to a friend, in which he expressed himself as follows: "At seasons, I feel a degree of consolation and Divine peace that cannot be expressed in words, which I would not exchange for a thousand times the treasures of both the Indies; in comparison of which I should esteem, I do esteem, crowns and sceptres as dung and dross. And at the much more frequent seasons when heavenly good is least sensibly felt, (I hope I write it with humble, heart-felt gratitude,) my faith, and hope, and confidence, are so firmly anchored on the everlasting Rock, Christ Jesus, that when the rains descend, and the winds and the storms beat, I am not greatly moved. I know Him in whom I have believed, and that He will in mercy keep all those who have committed themselves to him."

The evening preceding his dissolution, he conversed cheerfully with his family, and men-

tioned that he thought it a great favor to be removed without much bodily suffering. The following day, being the 30th of the 9th month, 1817, about five o'clock in the afternoon, while sitting in his chair, he closed his eyes, and gently stretching himself, quietly departed; and has, we have no doubt, joined that innumerable multitude which John beheld, who came out of great tribulation, and have washed their robes and made them white in the blood of the Lamb. His remains were interred the 6th of the 10th month following, in Friend's burial-ground at Manchester, after a large and solemn meeting held on the occasion. He was aged about seventy-five, and a minister about forty-three years.

Given forth by the meeting aforesaid, held at Manchester the First of the Fourth Month, 1818, and signed in and on behalf thereof, by
JOHN BLUDWICK, and others.

Read and approved in our Quarterly Meeting for Lancashire, held at Manchester the Second day of the Fourth Month, 1818, and in and on behalf thereof, signed by

GEORGE CROSFIELD, *Jun. Clerk.*

Signed on behalf of the Women's Meeting by
ELIZABETH CREWDSON, *Clerk.*

ON SCHOOLS.

BY J. WOOLMAN.

When we are thoroughly instructed in the kingdom of God, we are content with that use of things which his wisdom points out, both for ourselves and our children. We are not concerned to teach them the art of getting rich; but are careful that the love of God, and a right regard for all their fellow creatures may possess their minds;—and that, in all their learning, their improvements may go forward in pure wisdom.

Christ, our shepherd, being abundantly able and willing to instruct his family in all things proper for them to know, it remains to be our duty to wait patiently for his help in teaching our families;—and not seek to forward them in learning by the assistance of that spirit, from which he has given his life to redeem us.

It was his own saying "that the children of this world, are, in their generation, wiser than the children of Light." And it appears by experience, that in awakening and cherishing the spirit of pride, and the love of praise in children, they may sometimes be brought on in learning, faster than they would otherwise. But while, in learning any art and science, they accustom themselves to disobey the pure Spirit, and grow strong in that wisdom which is foolishness with God, they must have the painful labor of unlearning a part of what they thus learned, before they are adopted into the Divine family. It is, therefore, good for us, in schools and in all parts

of education, to attend diligently to the *Principle of universal Light*; and patiently wait for the improvement of children, in the channel of true wisdom, without endeavoring to get help from that spirit which seeks honor from men.

Children at an age fit for schools, are in a time of life that requires the careful and patient attendance of their tutors, and such a diligent observation of their several tempers and dispositions, as that they may be enabled rightly and seasonably to administer to each individual.

Were we thoroughly weaned from the love of wealth, and fully brought out of all superfluities in living;—employments about vanities being finished, and labor wanted only for things consistent with a humble, self-dying life, there would, on a reasonable estimate, be so much to spare on the education of our children,—that a plain, humble man, with a family like himself, might be furnished with a living, for teaching and overseeing so small a number of children, that he might properly and seasonably administer to each individual, and gently lead them on, as the gospel spirit opened the way, without giving countenance to pride or evil inclinations among them.

The management of children being sometimes committed to men who do not live under the seasoning virtue of Truth, is a case that requires our serious consideration; for it is our indispensable duty to use our utmost endeavors in their education to bring them into an acquaintance with the inward work of grace. And where tutors are not experienced in this work, their spirit and conduct, in directing and ordering the children, does often make impressions on their tender inexperienced minds, to their great disadvantage.

Again, where pious men enter into the employ, they sometimes find it difficult to support their families, without taking charge of so great a number that they cannot so fully attend to the spirit and disposition of each individual as would be profitable to the children. A large number of children in a school is often a heavy weight on the mind of an honest tutor; and when his thoughts and time are so much taken up in the more outward affairs of the school, that he cannot so attend to the spirit and temper of each individual, as to administer rightly and seasonably in the line of true judgment;—there the minds of children often suffer, and a wrong spirit gains strength; which frequently increases difficulties in a school, and, like an infection, spreads from one to another.

A man influenced by the spirit of Truth, employing his time in tutoring children,—while he hath only such a number that the manifestation of Divine strength in him is superior to the instability in them; this good spirit in which he governs, does measurably work on their minds, and tends to bring them forward in the Christian life. But where the straitness of a man's circumstances, joined with the small wages set

on teaching children, proves a temptation and so enters into his heart that he takes charge of too many for the measure of his gift;—or where the desire for wealth so corrupts the heart of any, that they take charge of too many; here the true order of a Christian education is frustrated.

To watch the spirit of children in school, and labor to bring them on as lambs in the flock of Christ, is of greater moment than their improvement in the knowledge of letters. But where a man hath charge of a number too great for that degree of strength with which the Lord hath endued him, he not only suffers as to the state of his own mind, but the children suffer also; and government not being supported in the true Christian spirit, the pure witness is not reached in the minds of the children.

To educate children in the way of true piety and virtue, is a duty incumbent on all who have them; and our heavenly Father requires no duties of us, but what he gives strength to perform, as we humbly seek to him. That though to the eye of reason the difficulties appear great, in many places, which attend instructing our children in useful learning, yet if we obediently attend to that wisdom which is from above, our gracious Father will open a way for us to give them such an education as he requires of us.

And here I may say, that my mind hath been sorrowfully affected on account of some, who, from a desire for wealth,—a desire to conform in living to those ways distinguishable from the true Christian spirit,—exert themselves in things relating to this life, and do not enough lay to heart the condition of youth, who, in many places, suffer through want of pious examples, and tutors whose minds are seasoned with the spirit of Truth.

Are great labors performed to gain wealth for posterity? Are many supported with wages to furnish us with delicacies, and luxuries?

Are monies expended for colors to please the eye, which render our garments less serviceable?

Are garments of a curious texture purchased at a high rate, for the sake of their delicacy?

Are there various branches of workmanship only ornamental, in the building of our houses, hanging by our walls and partitions,—and to be seen in our furniture and apparel?

And amidst all these expenses, which the pure Truth does not require of us, do we send our children to men to get learning, who, we believe, are not influenced by the spirit of Truth,—rather than humbly wait on the Lord for wisdom to direct us in their education?

To commit children to the tuition of men, who, we believe, are not rightly qualified to lead them on in the true Christian life, I believe no pious man will say is required of us as a duty.

To do evil that good may come of it, is contrary to the doctrine of Christianity. That when times are so cloudy that we cannot go forward

in the way of clearness and purity,—it behooves us, in the depth of humility, to wait on the Lord to know his mind concerning us and our children.

OF HUMILITY WITH RESPECT TO INTELLECTUAL ATTAINMENTS.

BY THOMAS A KEMPIS.

1. Every man naturally desires to increase in knowledge; but what doth knowledge profit, without the fear of the Lord? Better is the humble peasant, that serveth God, than the proud philosopher, who, destitute of the knowledge of himself, can describe the course of the planets. He that truly knows himself, becomes vile in his own eyes, and has no delight in the praise of man. If I knew all that the world contains, and had not charity, what would it avail me in the sight of God, who will judge me according to my deeds?

2. Rest from an inordinate desire of knowledge, for it is subject to much perplexity and delusion. Learned men are fond of the notice of the world, and desire to be accounted wise: but there are many things, the knowledge of which has no tendency to promote the recovery of our first divine life; and it is, surely, a proof of folly, to devote ourselves wholly to that, with which our supreme good has no connexion. The soul is not to be satisfied with the multitude of words; but a holy life is a continual feast, and a pure conscience the foundation of a firm and immoveable confidence in God.

3. The more thou knowest, and the better thou understandest, the more severe will be thy condemnation, unless thy life be proportionably more holy. Be not, therefore, exalted, for any uncommon skill in any art or science; but let the superior knowledge that is given thee, make thee more fearful, and more watchful over thyself. If thou supposest, that thou knowest many things, and hast perfect understanding of them, consider, how many more things there are which thou knowest not at all; and, instead of being exalted with a high opinion of thy great knowledge, be rather abashed by an humble sense of thy much greater ignorance. And why dost thou prefer thyself to another, since thou mayest find many who are more learned than thou art, and better instructed in the will of God?

4. If thou wouldst learn and know that which is truly useful, love to be unknown, and to be held in no estimation: for the highest and most profitable learning, is the knowledge and contempt of ourselves, and to have no opinion of our own merit; and always to think well and highly of others, is an evidence of great wisdom and perfection. Therefore, though thou seest another openly offend, or even commit some enormous sin, yet thou must not from thence take occasion to value thyself for thy superior goodness: for

thou canst not tell how long thou wilt be able to persevere in the narrow path of virtue. All men are frail, but thou shouldst reckon none so frail as thyself.

“He that placeth his confidence in man, or in any created being, is vain, and trusteth in a shadow. Be not ashamed to serve thy brethren in the meanest offices, and to appear poor in the sight of men, for the love of Jesus Christ. Presume not upon the success of thine own endeavours, but place all thy hope in God: do all that is in thy power with an upright intention, and God will bless with his favor the integrity of thy will. Trust not in thy own wisdom, nor in the wisdom and skill of any human being; but trust in the grace and favor of God, who raiseth the humble, and humbleth the self-presuming.

Glory not in riches, though they increase upon thee; nor in thy friends, because they are powerful: but glory in God, who giveth thee riches, and friends, and all things: and what is more than all, desireth to give thee himself. Be not vain of the gracefulness, strength, and beauty of thy body, which a little sickness can weaken and deform. Please not thyself with flattering reflections on the acuteness of thy natural wit, and the sweetness of thy natural disposition, lest thou displease God, who is the author of all the good that nature can dispense. Do not think thou art better than others, lest, in the sight of God, who only knoweth what is in man, thou be found worse. Be not proud of that in which thou art supposed to excel, however honored and esteemed by men; for the judgment of God and the judgment of men are infinitely different; and that displeaseth him which is commonly pleasing to them. Whatever good thou art truly conscious of, think more highly of the good of others, that thou mayest preserve the humility of thy spirit: to place thyself lower than all mankind, can do thee no hurt: but much hurt may be done, by preferring thyself to a single individual. Perpetual peace dwelleth with the humble, but envy, indignation, and wrath, distract the heart of the proud.

Men bestow honor upon one another. Sometimes they build up, sometimes they pull down. But human opinions cannot alter the reality of things, by making it greater or less than it is. Every man is truly such and such only *as he is in the sight of God.*

When I witness the erroneous estimate which men often place on certain kinds of human knowledge, I am reminded of one of the remarkable sayings which abound in the practical writings of St. Augustine. “Unhappy is he who knows everything else, and does not know God. Happy is he who knows God, though he should be ignorant of everything else.”

For Friends' Intelligencer.

HISTORICAL SKETCHES AND REFLECTIONS.

BY S. M. JANNEY.

No. 5.

It has been shown from the book of Genesis, that Cain and his progeny were the first to build cities, and to work in metals, which are considered evidences of progress in civilization, and it is remarkable that after the flood the earliest advances in the arts of civilized society, were made by the descendants of Ham, whose irrev- erent conduct called down upon his posterity the malediction of Noah. These instances from the earliest history of our race, seem to show that the arts of civilization may advance, and the intel- lectual powers may be cultivated, without a corresponding progress in piety and virtue.

The pursuits of agriculture, commerce and manufactures, by inducing the communities in which they prevail, to seek for settled homes, to acquire property, and to cultivate habits of in- dustry and economy, lay the foundation of na- tional greatness. But national prosperity can never be permanent, unless the morals of the people are preserved from corruption by a pure and vital religion.

The four civilized nations which sprung from the descendants of Ham were the Babylonians, Ethiopians, Egyptians and Phenecians. Nim- rod, the son of Cush, and grandson of Ham, "was a mighty hunter of the Lord," and doubt- less became a military chieftain and conqueror.

The beginning of his kingdom was Babel and Erech and Accad and Calneb, in the land of Shinar.* According to Josephus it was Nim- rod who instigated the erection of the tower of Babel, and he afterwards caused the city of Babylon to be built at the same place, "where he gradually changed the government into ty- ranny." Asshur, the son of Shem, was the founder of Ninevah,† on the Tigris, but there is reason to believe that Nimrod, with his conquer- ing army, took possession of it, and made it the seat of his kingdom. The level country watered by the Euphrates and the Tigris, was first called the land of Shinar, and afterwards, that portion of it which lies between the two rivers received the name of Mesopotamia. It was rendered very productive by irrigation and became ex- ceedingly populous.

The kingdom of Assyria was undoubtedly of great antiquity, and probably one of the earliest that existed after the flood. It has been re- marked by a modern traveller, that "the meagre and mostly fabulous notices scattered through the works of ancient writers, scarcely afford us any aid in the investigation of its history, for Ninevah had almost been forgotten before history began." But the excavations made among

its ruins, by Layard and others, have led to the discovery of monuments and inscriptions that have thrown much light upon the early history of that great empire, which, after existing 1300 years in power and splendor, was conquered, and its capital destroyed 606 years before the Christian era.

It is remarked by Layard, that "there is nothing in history either sacred or profane, or in the traditions handed down to us, against at- tributing the highest antiquity to the Assyrian empire.

In the land of Shinar, in the country watered by the Tigris and Euphrates, the Scripture places the earliest habitations of the human race. Whether we look upon that statement as the result of Divine inspiration, or whether we con- sider it as the record of a tradition, or an histor- ical fact received by the Hebrew legislator from elsewhere, still we have the evidence that at the very earliest period the belief was generally cur- rent, both amongst Egyptians and Jews, that the first settlements, were in Assyria; and that from Chaldea civilization and arts and sciences were spread over the world.

Abraham and his family, about 1900 years before Christ, migrated from a land already thickly inhabited, and possessing great cities. According to Josephus, the four confederate kings who marched in the time of the patriarch against the people of Sodom and the neigh- boring cities, were under a king of Assyria, whose empire extended over all Asia. Most of the early Greek authors, and those who have follow- ed them, recognizing a tradition which appears to have been generally prevalent, agree in as- signing to the first kings of Ninevah the remost antiquity; and in this they are confirmed by the Armenian historians. Their united tes- timony even tends to identify or to confound Ninus, the first king, with Nimrod himself, or with one of the immediate descendants of the scriptural Noah.*

Ninevah being situated in an alluvial coun- try, the buildings were constructed of brick composed of clay, mixed with straw and dried in the sun. Even the palaces which were of vast extent, were built chiefly of the same ma- terial; but it is supposed that the outer walls were cased with sculptured slabs of alabaster. The inner walls of the chambers were lined with slabs of alabaster sculptured in bas-relief with figures and inscriptions, illustrative of the his- tory of their kings, and the portals were guarded by colossal statues of winged human-headed lions.

"The interior of the Assyrian palace," writes Layard, "must have been as magnificent as im- posing. I have led the reader through its ruins, and he may judge of the impression its halls were

* Genesis x. 9, 10.

† Gen. x. 11.

* Ninevah and its Remains, ii. 176.

calculated to make upon the stranger, who, in the days of old, entered for the first time the abode of the Assyrian kings. He was ushered in, through the portal guarded by the colossal lions or bulls of white alabaster. In the first hall he found himself surrounded by the sculptured records of the empire. Battles, sieges, triumphs, the exploits of the chase, the ceremonies of religion, were portrayed on the walls, sculptured in alabaster, and painted in gorgeous colors. Under each picture were engraved in characters filled up with bright copper, inscriptions describing the scenes represented. Above the sculptures were painted other events, the king attended by his eunuchs and warriors, receiving his prisoners, entering into alliances with other monarchs, or performing some sacred duty. These representations were enclosed in colored borders, of elaborate and elegant designs. The emblematic tree, winged bulls and monstrous animals, were conspicuous amongst the ornaments. At the upper end of the hall was the colossal figure of the king, in adoration before the supreme deity, or receiving from his eunuch the holy cup. He was attended by warriors bearing his arms, and by the priests or presiding divinities. His robes and those of his followers were adorned with groups of figures, animals and flowers, all painted with brilliant colors. The stranger trod upon alabaster slabs, each bearing an inscription, recording the titles, genealogy, and achievements of the great king. Several doorways, formed by gigantic winged lions or bulls, or by the figures of guardian deities, led into other apartments, which again opened into more distant halls. In each were new sculptures. On the walls of some were processions of colossal figures—armed men and eunuchs following the king, warriors laden with spoil, leading prisoners or bearing presents and offerings to the gods. On the walls of others were portrayed the winged priests, or presiding divinities, standing before the sacred trees.”

From the sculptured monuments and inscriptions that have been disinterred from the ruins of Nineveh, it appears that the history of that buried empire, like most others which have existed on earth, was chiefly a record of war-like expeditions, devastated kingdoms, and captives dragged in chains, subjected to excruciating tortures, or led to an ignominious death.

How mournful it is to reflect on the vast amount of misery inflicted upon millions of the human family during the four thousand years that have elapsed since the foundation of Babylon and Nineveh. War, ruthless war, and grinding oppression have been almost incessantly engaged in the work of degradation and destruction; while the voice of mercy has been unheeded, and the claims of justice disregarded.

We shall find, however, throughout the course of the world's history, that signal retribution has

ever attended the infringement of the divine laws, and has been especially manifested in the fall of those empires which were built up by violence and extended by oppression.

The reflections of Layard on disinterring the winged human headed lions from the ruins of Nineveh are striking and appropriate.

“I used to contemplate for hours these mysterious emblems, and muse over their intent and history.” . . . “Through the portals which they guarded, kings, priests, and warriors had been sacrificed to these altars, long before the wisdom of the East had penetrated to Greece, and had furnished its mythology with symbols long recognized by the Assyrian votaries. They may have been buried and their existence may have been unknown, before the foundation of the eternal city. For twenty five centuries they had been hidden from the eye of man, and they now stand forth once more in their native majesty. But how changed was the scene around them! The luxury and civilization of a mighty nation had given place to the wretchedness and ignorance of a few half barbarous tribes. The wealth of temples and the riches of great cities had been succeeded by ruin and shapeless heaps of earth. Above the spacious hall in which they stood, the plough had passed, and the corn now waved. Egypt has monuments no less ancient and no less wonderful; but they have stood forth for ages to testify her early power and renown; whilst those before me had but now appeared to bear witness in the words of the prophet, that once the Assyrian was a cedar in Lebanon, with fair branches, and with a shadowing shroud of a high stature; and his top was among the thick boughs . . . his heart was exalted above all the trees of the field, and his boughs were multiplied, and his branches became long, because of the multitude of waters when he shot forth. All the fowls of the heaven made their nests in his boughs, and under his branches did all the beasts of the field bring forth their young, and under his shadow dwelt all great nations,* for now is ‘Nineveh a desolation and dry like a wilderness, and flocks lie down in the midst of her; all the beasts of the nations, both the cormorant and bittern, lodge in the upper lintels of it; their voice sings in the windows; and desolation is in the thresholds.’†

The past is gone; the future has no existence. The *present*, which a certain writer calls the “divine moment,” or moment of God, is the only period of time which is really committed to us. As there is no other point of time in which we can really serve God but this, which is present to us, the language of the heart should ever be, What wilt thou have me to do *now*?

From Beeson's Plea for the Indian.

THE INDIAN.

A discourse on the cause and cure of Indian Difficulties within our Territories, by JOHN BEESON.

"The knowledge of the cause is half the cure."

Believing that this proposition is true, and especially applicable to the subject we are considering, let us look for a moment at the grand primal cause whence all the evils between the races have arisen. This I conceive to be in the unnatural position assumed by our government, the whole policy of which is to keep the tribes in subjection through fear—to overawe and chastise them (which means to kill them). The effect of this treatment, naturally enough, calls forth the corresponding faculties into constant exercise. Thus the Indians are denounced for being cunning and revengeful, when the fact is, caution and combativeness, from which these manifestations arise, are the only traits of character which, under such treatment, can become conspicuous.

It does not follow that because the Indians are not our equals in the arts and sciences, or that their tiny canoe cannot compare with our steamboat, or their bow and arrow with our rifle and revolver, that we have, therefore, a right to control them by coercive measures. This is only the right of might which tyrants use, and is always founded in injustice, and sooner or later punishes and often destroys the perpetrator.* *

But we are met on every hand with the assertion that the strong will overpower the weak, and that, as a matter of necessity, the latter will have to give place to the superior race, for so nature hath ordained, etc. etc. We answer, that if man was only an intellectual brute, and brute purposes were the only object of his creation, the argument would be good enough; but since all true religion, and all true philosophy, and all experience, teach us that the permanence and strength of men and nations depend upon integrity to high moral principle, the argument is not creditable to the piety and judgment of those who use it. Such should know that knowledge without virtue, or learning without love, become antagonistic, and work their own destruction. * * * *

The evil originated, I conceive, in the position we occupy. Like our fathers, we assume that the Indians are pagans—savages—and must be converted or perish; and that, as their guardians, we must govern them or kill them. It is true we make treaties with them, acknowledge, as of right we should, each others respective sovereignty; but then we immediately regard them as wards, and in some cases as paupers and vagabonds. Thus we destroy their ambition by taking away the motive to emulation and progress. Their consciousness of natural right is outraged, and they become discouraged, and lose the power and almost the desire to improve.

The idea that our Government truly sustains the relation of guardian, to protect the persons

and property of these people is a mistake—a fallacy. The position we occupy in this relation is that of a usurper. And the practical administration of its power is that of a destroyer. And because the result of this relation shocks the truest instincts and highest moral sense of the nation, we conclude without any reference to the causes, that legitimate destiny, or some resistless agency, controls it.

We thus see that the past and present difficulties with the Indians may be justly attributed to the fact of our depriving them of the power of self-government and self-defense, and by this crowning act of wrong, exposing them to the abuses and crimes of the civilized, without the motive or ability to resist their contaminations. We also see that in degrading them, the wrong has reacted upon ourselves, until the moral tone and high character of our people is becoming every day more and more questionable before the world. There is, therefore, the strongest possible reason, both from a sense of justice to the Indian, and regard for our national interest, to apply

THE REMEDY.

This, I conceive, would require Congressional enactments to the following effect:

1. To appropriate sufficient domains, as nearly as possible, to the respective natiivities of those tribes not yet provided for.
2. To preserve sacredly free for the Indians' exclusive use, all the lands heretofore granted to them by treaty stipulations.
3. To make it obligatory upon the authorities to restrain all aggressions upon the Indian territories.
4. To organize the Indian Department in such a manner as to free it from the speculations of the fraudulent, and the intrigues of the politician, and to make it permanent, and not subject to change with every changing administration.

The justice of these propositions is self-evident; and every one who can realize that himself and family and all the dearest interests of life are involved therein, would demand compliance with them. And there can be no good reason why Government should not comply; for if we make treaties with a people, no matter how weak they are, national honor and good faith require a punctual fulfilment, because this is their only guarantee, and therefore should be by us most sacredly observed.

But it is objected that the suggestion is impracticable, from the fact that government functionaries are changed with every succeeding administration, and that rotation in office is a democratic principle, and cannot be obviated. Admitting the wisdom and justice of the objection, it shows the necessity of what we have already proposed, viz., that the Indian Department should be entirely free from all predilections of parties as at present constructed; in other words

it should partake more of the benevolent and paternal character, as standing between two, to maintain justice for each, and the rights of both. It follows that the Indian, as well as the American, should be fully and prominently represented; but this is not, and can not be the case, so long as his affairs are exclusively in the hands of those whose primary object is to promote party or personal purposes. We should tremble for the interests of our children did we know that they would fall under the control of different parties, who would each in turn enrich themselves out of their patrimony. If, then, it is proper to treat the Indian as a ward or minor, it is equally proper that he should have, like them, the election of his own guardians, and the right to change them when required for the redress of grievances, otherwise changes would be both unnecessary and disastrous.

There is another consideration of great moment, which the cases illustrate: a minor is encouraged and aided to fit himself, in due season, for independence. The relation of guardian is arranged very properly for this purpose. But for the Indian the reverse of this seems to be the object, and a multitude of officials, at an enormous expense, are kept in pay, who really help to keep the Indians dependent and unprogressive; and it cannot be denied that their interference sometimes engenders disquiet, occasions war, and burdens the country with "*expensive military expeditions.*" Now to remedy all this, I would respectfully submit the substitution of the

"AMERICAN INDIAN AID ASSOCIATION."

Whose constitution calls for a board of managers to the number of twenty-five persons, to consist of both sexes, who would become the authorized guardians of the Indians' interest, to take cognizance of all their financial affairs so far as relates to the government, to have the selection and appointment of a sufficient number of persons to settle upon each reserve, to aid them in the developement of their resources, by the encouragement of manufacturers, of commerce, and the culture of such staples as their country will produce, so as to become self-sustaining and progressive in all the vocations of a true civilization.

This Association being based upon a benevolent and patriotic platform—having neither sectarian nor political aims, and being composed of representatives of different classes—would be more likely to advance the highest interests of both races, than could be reasonably expected from temporary officials under the control of a dominant sect or party.

It is not the purpose of this Association to govern, so much as to aid the Indians with the facilities and example for self-developement and self-sustenance, giving them the lights of science and arts, leaving them at perfect liberty to break

up or retain the tribal state as they please, and to adopt such social and commercial relations as shall conduce to the mutual harmony of themselves and those engaged in their improvement.

In order to give efficiency, and to insure success to the plan contemplated, it is proposed to locate at once from fifty to a hundred persons, more or less, upon every suitable place for a convenient settlement within the respective domains, where from three hundred to six hundred Indians can be collected together—subject, however, to such arrangements as the parties desire. The settlers shall be composed of a fair proportion of farmers, gardeners, mechanics, and professional persons, all of whom shall be of sound intellect and stirring integrity, kind in disposition and temperate, simple and industrious in their habits, and who will readily conform to the regulations of their respective communities.

The best teachers, and the best modes of instruction adapted to the Indian mind, as well as for the settlers, shall be adopted, and upon all the principal reserves a printing-press should be in use to encourage communications and promote honorable emulation among the tribes. Also upon each a model farm and garden should be established. * * * *

It must be obvious to every thinking mind, that the plan proposed can hardly fail of success, provided Government gives it the necessary encouragement; for who does not see that these colonies of industrious men and women, in harmonious action causing the earth to bring forth plenty, and forming homes adorned with articles of use and beauty, would form nuclei of attraction, around which the untaught Indian would gravitate as naturally as the streams run to the ocean? It could not be otherwise than that these examples, illustrating the advantages of labor, would do more to raise the Indian morally and intellectually, in one year, than could be accomplished in a life-time under present arrangements, for the simple reason that all their interests would be considered, and their whole nature appealed to without exciting opposition by disputing their creeds or their ceremonies.

But some will ask, is the object worth the expense? The answer is, Yes; inasmuch as it is more economical to save than to destroy, to enjoy peace than to prosecute war, to have our Indian territories occupied with thriving communities instead of "predatory and hostile savages," and to have the great heart of our whole nation throbbing with its own congenial impulse for liberty and justice for all, instead of the fitful and sickly palpitation of a tyrant coward.

The advantages of the proposition are incalculable, for all the above and vastly more would be realized; and even if the Indians alone were to be the recipients of benefit, the object would be sufficiently grand and just to command the best energies of the country for its accomplish-

ment. We owe all they require, both as a debt and as a restitution; and until this is paid, there can be no foundation for national reform or permanent peace.

It is, then, not so much a matter of dollars and cents as of vital principles. The question is not alone, Shall we save the Indians? but shall we save ourselves? * * * Or shall we continue, as at present, to divide and devour each other, and like the forgotten nations of antiquity, crumble into inglorious oblivion, leaving it for other nations, or another race, to work out a higher destiny for humanity?

The subject commends itself with a stern directness to every statesman, and with a fervidness to every patriot and to every parent, stronger than words can express. It proclaims aloud, that the spoils of the Indians, are but the expressions of rights disowned, of humanities crushed, and that the same potency will ere long ultimate in America's destruction. With these certainties before us, and with the power to choose good or evil for ourselves and for our children, may I not entreat my countrymen to save the outcasts, lest we become castaways—to have mercy and do justly—that our days may be long in the land; that the blessings of them that are ready to perish may come upon us, and that the great Father of all may again lift upon us the light of his countenance, and cause peace and joy to be our inheritance forever.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FOURTH MONTH 23, 1859.

We mentioned in a former number that efforts were being made in this city to form an Indian Aid Association. We are glad to state that such an Association has been formed, and that it commends itself to the attention of Friends not only as a benevolent enterprise, and as affording a field for those to labor who have long felt the wrong, but because the articles of association are based upon peaceable principles, and are not sectarian in their character. This movement has not been ushered in by popular clamor, and has little in it at present to attract those who are seeking for great things; but it has grown out of the fact that the attention of a few thoughtful persons has been called to the subject by an eye witness of some of the wrongs and sufferings of the Indians. We give some extracts from "A Discourse on the cause and cure of Indian difficulties within our Territories, by John Beeson." The plan and objects stated may seem of a magnitude almost too great to attempt, and no doubt

many difficulties and discouragements will have to be encountered, yet when we remember that *human hearts* are to be appealed to which can respond to justice and truth when rightly touched, we have reason to look for ultimate success to every effort which originates in enlightened and disinterested benevolence.

MARRIED, By the approbation of Gwynedd Monthly Meeting of Friends, at the residence of the bride's father, in Norristown, Pa., on the evening of the 7th inst., GEORGE F. NORTH, son of the late Abel North, of Philadelphia, to LYDIA K., daughter of Jacob L. Paxon.

—, According to the order of Friends, on 3d day, the 12th inst., at the house of her father, WILLIAM COCKS, and SARAH, daughter of Henry C., and Deborah Bowron.

Subscribers who do not preserve the *Intelligencer* for binding, and have Nos. 1, 2, or 3,—particularly No. 1, of the present volume—will confer a favor on the publisher by sending it to his address by mail.

A FRIEND of middle age, desires a situation as assistant in a Boarding School. She is capable of superintending domestic affairs. Enquire, for further particulars, of

REBECCA TURNER,
15 S. Howard St., Baltimore.

From the Atlantic Monthly.

UGHT WOMEN TO LEARN THE ALPHABET?

(Continued from page 72.)

Nothing can be more absurd than to impose entirely distinct standards, on the two sexes, or to expect that woman, any more than man, will accomplish anything great without due preparation and adequate stimulus. Mrs. Patten, who navigated her husband's ship from Cape Horn to California, would have failed in the effort, for all her heroism, if she had not, unlike most of her sex, been taught to use her Bowditch. Florence Nightingale, when she heard of the distresses in the Crimea, did not, as most people imagine, rise up and say, "I am a woman, ignorant, but intuitive, with very little sense of information, but exceedingly sublime aspirations; my strength lies in my weakness; I can do all things without knowing anything about them." Not at all. During ten years she had been in hard training for precisely such services,—had visited all the hospitals in London, Edinburgh, Dublin, Paris, Lyons, Rome, Brussels, and Berlin,—had studied under the Sisters of Charity, and been twice a nurse in the Protestant Institution at Kaiserswerth. Therefore she did not merely carry to the Crimea a woman's heart, as her stock in trade, but she knew the alphabet of her profession better than the men around her. Of course, genius and enthusiasm are for both sexes, elements unforeseen and incalculable; but, as a general rule, great achievements imply great preparations and favorable conditions.

To disregard this truth is unreasonable in the

abstract and cruel in its consequences. If an extraordinary male gymnast can clear a height of ten feet with the aid of a spring-board, it would be considered slightly absurd to ask a woman to leap eleven feet without one; yet this is precisely what society and the critics have always done. Training and wages and social approbation are very elastic spring-boards, and the whole course of history has seen these offered bounteously to one sex and as sedulously withheld from the other. Let woman consent to be a doll, and there was no finery so gorgeous, no baby-house so costly, but she might aspire to share its lavish delights;—let her ask simply for an equal chance to learn, to labor, and to live, and it was as if that same doll should open its lips, and propound Euclid's forty-seventh proposition. While we have all deplored the helpless position of indigent women, and lamented that they had no alternative beyond the needle, the wash-tub, the school-room, and the street, we have yet resisted their admission into every new occupation, denied them training, and cut their compensation down. Like Charles Lamb, who atoned for coming late to the office in the morning by going away early in the afternoon, we have, first, half educated women, and then, to restore the balance, only half paid them. What innumerable obstacles have been placed in the way of female physicians! what a complication of difficulties has been encountered by female printers, engravers, and designers! In London, Mr. Bennett was recently mobbed for lecturing to women on watchmaking. In this country, we have known grave professors to refuse to address lyceums which thought fit to employ an occasional female lecturer. Mr. Comer states that it was "in the face of ridicule and sneers" that he began to educate women as book-keepers, eight years ago; and it is a little contemptible in the authoress of "A Woman's Thoughts on Women" to revive the same satire now, when she must know that in one half the retail shops in Paris her own sex rules the ledger, and Mammon knows no Salic law.

We find, on investigation, what these considerations would lead us to expect, that eminent women have commonly been more exceptional in their training and position than even in their genius. They have excelled the average of their own sex because they have had more of the ordinary advantages of the other sex. Take any department of learning or skill; take, for instance, the knowledge of languages, the universal alphabet, philology. On the great stairway, at Padua, stands the statue of Elea Cornaro, professor of six languages in that once renowned university. But Elena Cornaro was educated like a boy, by her father. On the great door of the University of Bologna is inscribed the epitaph of Clotilda Tambroni, the honored correspondent of Porson, and the first Greek scholar of Southern Europe in her day. But Clotilda Tambroni was educat-

ed like a boy, by Emanuele Aponte. How fine are those prefatory words, "by a Right Reverend Prelate," to that pioneer book in Anglo-Saxon lore, Elizabeth Elstob's grammar: "Our earthly possessions are indeed our patrimony, as derived to us by the industry of our fathers; but the language in which we speak is our mother-tongue, and who so proper to play the critic in this as the females?" But this particular female obtained the rudiments of her rare education from her mother, before she was eight years old, in spite of much opposition from her right reverend guardians. Adelung, the highest authority, declares that all modern philology is founded on the translation of a Russian vocabulary into two hundred different dialects by Catherine II. But Catherine shared, in childhood, the instructors of her brother, Prince Frederick, and was subject to some reproach for learning, though a girl, so much more rapidly than he did. Christina of Sweden ironically reproved Madame Dacier for her translation of Callimachus: "Such a pretty girl as you are, are you not ashamed to be so learned?" But Madame Dacier acquired Greek by contriving to do her embroidery in the room where her father was teaching her stupid brother; and her queenly critic had learned to read Thucydides, harder Greek than Callimachus, before she was fourteen. And so down to our own day, who knows how many mute, inglorious Minervas may have perished unenlightened, while Margaret Fuller and Elizabeth Barrett Browning were being educated "like boys?"

This expression simply means that they had the most solid training which the times afforded. Most persons would instantly take alarm at the very words; that is, they have so little faith in the distinctions which Nature has established, that they think, if you teach the alphabet, or anything else, indiscriminately to both sexes, you annul all difference between them. The common reasoning is thus: "Boys and girls are acknowledged to be distinct beings. Now boys study Greek and algebra, medicine and book-keeping. Therefore girls should not." As if one should say: "Boys and girls are distinct beings. Now boys eat beef and potatoes. Therefore, obviously, girls should not."

The analogy between physical and spiritual food is precisely in point. The simple truth is, that, amid the vast range of human powers and properties, the fact of sex is but one item. Vital and momentous in itself, it does not constitute the whole organism, but only a small part of it. The distinction of male and female is special, aimed at a certain end; and apart from that end, it is, throughout all the kingdoms of Nature, of minor importance. With but trifling exceptions, from infusorial up to man, the female animal moves, breathes, looks, listens, runs, flies, swims, pursues its food, eats it, digests it, in precisely the same manner as the male; all instincts,

all characteristics, are the same, except as to the one solitary fact of parentage. The eagle is not checked in soaring by any consciousness of sex, nor asks the sex of the timid hare, its quarry. Nature, for high purposes, creates and guards the sexual distinction, but keeps it humbly subordinate to still more important ones. * * * * *

Everybody sees that the times are altering the whole material position of woman; but most persons do not appear to see the inevitable social and moral changes which are also involved. As has been already said, the woman of ancient history was a slave to physical necessities, both in war and peace. In war she could do too little; in peace she did too much, under the material compulsions which controlled the world. How could the Jews, for instance, elevate woman? They could not spare her from the wool and the flax and the candle that goeth not out by night. In Rome, when the bride first stepped across her threshold, they did not ask her, Do you know the alphabet? they asked simply, Can you spin? There was no higher epitaph than Queen Amalasontha's,—*Domum servavit, lanam fecit*. In Bœotia, brides were conducted home in vehicles whose wheels were burned at the door, in token that they were never to leave the house again. Pythagoras instituted at Crotona an annual festival for the distaff; Confucius, in China, did the same for the spindle; and these celebrated not the freedom, but the serfdom, of woman.

And even into modern days this same tyrannical necessity has lingered. "Go spin, you jades! go spin!" was the only answer vouchsafed by the Earl of Pembroke to the twice-banished nuns of Wilton. And even now, travellers agree that throughout civilized Europe, with the partial exception of England and France, the profound absorption of the mass of women in household labors renders their general elevation impossible. But with us Americans, and in this age, when all these vast labors are being more and more transferred to arms of brass and iron,—when Rochester grinds the flour, and Lowell weaves the cloth, and the fire on the hearth has gone into black retirement and mourning,—when the wiser a virgin is, the less she has to do with oil in her lamp,—when the needle has made its last dying speech and confession in the "Song of the Shirt," and the sewing-machine has changed those doleful marches to delightful measures,—how is it possible for the blindest to help seeing that a new era is begun, and that the time has come for woman to learn the alphabet?

Nobody asks for any abolition of domestic labor for women, any more than of outdoor labor for men. Of course, most women will still continue to be mainly occupied with the indoor care of their families, and most men with their external support. All that is desirable for either sex is such an economy of labor, in this respect,

as shall leave some spare time, to be appropriated in other directions. The argument against each new emancipation of woman is precisely that always made against the liberation of serfs and the enfranchisement of plebeians,—that the new position will take them from their legitimate business. "How can he [or she] get wisdom that holdeth the plough, [or the broom,]—whose talk is of bullocks (or of babies)?" Yet the American farmer has already emancipated himself from these fancied incompatibilities, and so will the farmer's wife. In a nation where there is no leisure-class and no peasantry, this whole theory of exclusion is an absurdity. We all have a little leisure, and we must all make the most of it. If we will confine large interests and duties to those who have nothing else to do, we must go back to monarchy at once; if otherwise, then the alphabet, and its consequences, must be open to woman as to man. Jean Paul says nobly in his "Levana," that, "before and after being a mother, a woman is a human being, and neither maternal nor conjugal relation can supersede the human responsibility, but must become its means and instrument." And it is good to read the manly speech, on this subject, of John Quincy Adams, quoted at length by his recent venerable biographer,—in which, after fully defending the political petitions of the women of Plymouth, he declares that "the correct principle is, that women are not only justified, but exhibit the most exalted virtue, when they do depart from the domestic circle, and enter on the concerns of their country, of humanity, and of their God."

(To be continued.)

WALK SOFTLY.

The tiniest pebble thrown sea-ward from the beach, causes a wavelet, whose influences are felt for unnumbered leagues out upon old ocean's bosom. The softest whisper excites vibrations in the atmosphere around us, which cease not this side the boundless ether; so the act or thought of an immortal man, however insignificant, may color a lifetime, may leave influences which shall not cease, until time shall be no longer; influences for good or ill, to millions of immortals like himself, for unending ages. These things being so, it would seem that every act should be a felt responsibility, and every thought a prayer. Let us all walk softly then, or at least with a motive and a wish for good.

A crust of bread thrown thoughtlessly by a fellow student, made Prescott, in a measure, sightless for near half a century. An ill-timed jest has severed many a warm friendship, and planted bitterness for a lifetime, where ought to have welled up the warmest, and purest, and loveliest springs of our nature. Many a time and oft, has a frown, a harsh word, an unfeeling or contemptuous gesture, crushed resolves forever,

which were budding to a new and changed and better life. Reader, let us all walk softly then by day and by night, at home and abroad, inasmuch as for every step in life, we must give account at the judgment.—*Hall's Journal of Health.*

MY FIFTIETH BIRTHDAY.

BY FRANCIS D. GAGE.

I used to think, when I, a child,
 Played with the pebbles on the shore,
 Of the clear river, rippling wild,
 That rolled before my father's door,
 How long, how very long 'twould be
 Ere I could live out fifty years ;
 To think of it oft checked my glee,
 And filled my childish heart with fears.

I looked at grandma as she sat,
 Her forehead decked with silvery rime,
 And thought " When I'm as old as that,
 Must I darn stockings all the time ?
 Must I sit in an arm chair so,
 A white frilled cap around my face,
 With dull drab strings, and ne'er a bow,
 And keep things always in their place ? "

The lines of care, the sigh of pain,
 The " Hush ! " her lips so oft let fall,
 Made me wish, o'er and o'er again,
 I never might grow old at all.
 Yet she was ever cheerful, and
 Would oft times join our sports and mirth ;
 And many a play by her was planned
 Around the winter evening hearth.

But then she played not by the brook,
 She did not gather pretty flowers,
 She did not sing with merry look,
 Nor make a spring-time of the hours.
 So, when she said, one sunny morn,
 " You will be old, like me, some day,"
 I wept like one of hope forlorn,
 And threw my playthings all away.

Be old ! like grandma and not roam
 The glen in spring, for violets blue,
 Or bring the bright May blossoms home,
 Or pick the strawberries 'mong the dew !
 Be old ! and in the summer time
 Take weary naps in mid-day hours,
 And fail the Chandler trees to climb,
 And shake the ripening fruit in showers !

Be old ! and have no nutting-bees
 Upon the hillside, rustling brown,
 Or hang upon the vine-clad trees,
 And shout the rich ripe clusters down !
 Be old ! and sit round wintry fires !
 Be fifty ! have no sliding spree ?
 And hush away all wild desires !
 I thought 'twere better not to be.

But two score years have glided by,
 With summer's heat and winter's cold,
 With sunny hours and clouded sky,
 Till now I'm fifty—now I'm old.
 The sun-burnt looks are silvery now,
 That used to dangle in the wind ;
 And eyes are dim, and feet move slow,
 That left my playmates all behind.

I'd like to climb the apple tree,
 Where once the spicy sweeting grew,
 Make grape-vine swings and have a glee ;
 But I am *fifty*—'t would n't do.

I'd like to go a nutting now,
 And gather violets in the glen—
 And wreath the wild flowers round my brow,
 As well as e'er I did at ten.

I like to slide upon the pond,
 To watch the old mill struggling there
 In icy chains while all beyond
 Was one broad mirror, cold and glare.
 I'd like to see the noisy school,
 Let out a-nooning, as of old,
 Play " Lost my glove," and " Mind the rule ;"
 My heart throbs quick—it is not cold.

I hear the cry of Kate and Jane,
 Of Lottie, Lina, Helen, Sue—
 Ah, yes ! (I'll own it) in between
 Come George and Dan, and William, too.
 I'm fifty, but I am not sad ;
 I see no gloom in ripening years ;
 My hopes are bright, my spirit glad—
 How vain were all my childish fears !

My childish sports, I loved them then ;
 I love to think them over still ;
 To shut my eyes, and dream again
 Of silvery stream and woodland hill.
 But life has pleasures holier still
 Than childhood's play, with all its zest,
 That, as we journey down the bill,
 Make each succeeding year the best.

Now stalwart men are at my hearth,
 And " bonnie lassies " laughing free,
 That had not lived on this good earth,
 To love and labor, but for me ;
 And shall I pine for childhood's joys,
 For woodland walks and violets blue,
 While round me merry girls and boys
 Are doing what I used to do ?

My days of toil, my years of care,
 Have never chilled my spirit's flow,
 Or made one flower of life less fair
 Than in the spring-time long ago.
 The paths I trod were sometimes rough,
 And sharp and piercing to my feet ;
 Yet there were daisied walks enough
 To make it all seem smooth and sweet,

Friends that I loved have passed from sight
 Before me to the spirit home ;
 But in the day that knows no night,
 I know they'll greet me when I come,
 Hopes that I cherished, too, were vain ;
 But I have lived to feel and know
 That were life to live o'er again,
 'Twere better that it should be so.

At every winding of the way,
 I've sought for love, and love have given ;
 For love can cheer the darkest day,
 And make the poorest home a heaven.

Oh ! ye who 're passing down like me,
 Life's autumn side, be brave and strong,
 And teach the lisper at your knee
 That fifty years is not *so long* ;
 That if they would be ever young
 And free from dolorous pain and care,
 The life-harp must be ever strung
 With love of duty everywhere.

As violins in foreign lands,
 Broken and shattered o'er and o'er,
 When mended and in skilful hands,
 Make sweeter music than before,
 So, oft the heart, by sorrow torn,
 Gives forth a loftier, clearer song

Than that which greeted us at morn,
When it was new, and brave, and strong.

Father, I thank thee for them all,
These fifty years which now have passed;
Oh! guide me, guard me, till the fall
Of death my form shall hide at last.
Let me in love and kindness still
Live on, nor e'er grow hard and cold;
Bend me and break me to thy will,
But may my spirit ne'er grow old!

From the Boston Journal.

BOTH SIDES.

A man in his carriage was riding along,
A gaily dressed wife by his side;
In satin and laces she looked like a queen,
And he like a king in his pride.

A wood-sawyer stood on the street as they passed,
The carriage and couple he eyed,
And said, as he worked with his saw on the log,
"I wish I was rich and could ride."

The man in the carriage remarked to his wife—
"One thing I would give if I could—
I would give all my wealth for the strength and the
health
Of the man who saweth the wood."

A pretty young maid, with a bundle of work
Whose face as the morning is fair,
Went tripping along with a smile of delight,
While humming a love-breathing air.

She looked on the carriage,—the lady she saw,
Arrayed in apparel so fine,
And said in a whisper, "I wish from my heart
Those satins and laces were mine."

The lady looked out on the maid with her work,
So fair in her calico dress,
And said, "I'd relinquish possession and wealth
Her beauty and youth to possess."

Thus in this world, whatever our lot,
Our minds and our time we employ
In longing and sighing for what we have not,
Ungrateful for what we enjoy.

We welcome the pleasure for which we have sighed;
The heart has a void in it still,
Growing deeper and wider the longer we live,
That nothing but heaven can fill.

THE STUDY OF NATURE.

LECTURE BY PROF. AGASSIZ.

But I have undertaken to address you upon the desirableness of introducing the study of natural history in our schools, and of establishing that instruction as a means of developing the faculties, and as a means of leading the child to the knowledge of the Creator, and I will now turn to the point of my address. Natural History, I have already said, should be taught from objects and not from books, and you see at once that this requires teachers who know these objects, and not merely teachers who can read and see whether the lesson set has been committed faithfully to memory. The teacher must know these objects before he can teach them. And he ought to bring them into the school, and to exhibit them

to the scholars, and not only that, but to place them in the hands of each scholar.

Some years ago I was requested by the Secretary of the Board of Education to give some lectures on Natural History to the teachers assembled in different parts of the State in those interesting meetings known as teachers' institutes; and I had been asked to give some instruction on insects, that the teachers might be prepared to show what insects are injurious to vegetation, and what are not, and that they might impart that information to all. I thought the best way to proceed would be to place the objects in their own hands, for I knew that mere verbal instruction would not be transformed into actual knowledge, that my words would be carried away as such, and that what was needed was the impression of objects. I therefore went out and collected several hundred grasshoppers, brought them in, and gave one into the hand of every one present. It created universal laughter; yet the examination of these objects had not been carried on long before every one was interested, and instead of looking at me, looked at the thing. And they began to examine and to appreciate what it was to see, and see carefully. At first, I pointed out the things which no one could see. "We can't see them," they said. "But look again," said I, "for I can see things ten times smaller than these;" and they finally discerned them. It is only the want of patience in the difficult art of seeing that makes it so much more difficult. The power of the human eye is very great, and it is the want of training which sets so narrow limits to its boundaries. After having examined one object minutely—one of those objects which can be seen everywhere, take another, one which has some similitude to it. Analyze its parts one after the other. Point out the difference which exists between this and that examined before, and you are at once on that track so important in all education, which exists in comparisons. It is by comparisons that we ascertain the difference which exists between things, and it is by comparisons, also that we ascertain the general features of things, and it is by comparisons that we reach general propositions. In fact, comparisons are at the bottom of all philosophy. Without comparisons we never can generalize. Without comparisons we never could go beyond the knowledge of isolated, disconnected facts. Now, do you not see what importance there must be in such training; how it will awaken the faculties, how it will develop them, how it will be suggestive of further inquiries and further comparisons, and as soon as one has begun that sort of study there is no longer any dulness in it. Once imbued with the delight of studying the objects of nature, the student only feels that his time is too limited in proportion to his desire for more knowledge. And I say that we can in this way become better

acquainted with ourselves. We can understand our own nature, our relations to the world at large in a better manner. We can know how we are related to the whole animal kingdom, if we once begin that kind of comparison. At first it may seem difficult to find any resemblance between man and quadrupeds, between quadrupeds and birds, between birds and reptiles, between reptiles and fishes; and if we were to attempt to compare a fish to a man, it would seem preposterous. And yet the two are constructed on the same plan. The same elements of structure which we may see in the fish, are, only in a more lofty combination, presented again in the man, and it may be shown in the simplest manner that there is one simple gradation leading up from the fish to the noble stature of man. And these comparisons are the best means of developing all our faculties, because they call out not only all the powers of observation, but the ability of man to generalize, and at the same time to discriminate. They call into effect all those abilities which distinguish men from men, which give men power over other men, and give men the power of discriminating judiciously, and of combining properly all the ability of discerning differences, as well as resemblances: one constitutes the art of observing, while the other constitutes the art of the philosopher. The difficult art of thinking can be acquired by this method in a more rapid way than any other. When we study logic or mental philosophy in text-books, which we commit to memory, it is not the mind which we cultivate—it is the memory alone. The mind may come in, but if it does in that method, it is only in an accessory way. But if we learn to think by unfolding thoughts ourselves from the examination of objects brought before us, then we acquire them for ourselves, and we acquire the ability of applying our thoughts in life. It is only by the ability of observing for ourselves that we can free ourselves from the burden of authority. As long as we have not learned how to settle a question for ourselves we go for authority, or we take the opinion of our neighbor; that is, we remain tools in his hands, if he chooses to use us in that way, or we declare our incapability of having an opinion of our own. How shall we form opinions of our own otherwise than by examining the facts in the case; and how can we learn to examine facts more readily than by taking at first those facts which are unchangeable, those facts over which man, with all his pride, can have no control. Man cannot make the sun to start off and move in space; man cannot change the principles of the solar system; he cannot make plants sprout out of their season; he must take the phenomena of nature as they are. They should teach him humility and truth. He should learn that what exists in nature is true, and that to learn to follow truth he must bow to what is; he must

bow to what he cannot change from the nature of things; but at the same time he learns how to ascertain what is and how things are; and while he learns that, he acquires a power which afterward can neither be checked nor lessened, and which is ever improving in proportion as opportunity for further observation is increasing. I will select a very trivial case to show you in what way we may reach a question from the observation of special facts. Let us take an earth-worm. [Prof. A. here drew on the blackboard representations of the things described.] It is a cylindrical elongated animal, with transverse rings all along. Upon each of these rings there are stiff bristles standing out in opposite directions by the motion of which the animal moves along. Let us examine the lobster. Here we have another animal, with a body, tail, leg, and a variety of appendages in the shape of claws and legs. It has no resemblance to the earth-worm. Let us examine the wasp or bee. Here we have an animal still different. It has wings, and it presents three different regions of the body, and yet it is constructed on the same plan as the others. Let us see what they have in common. There are a succession of rings which are moveable one upon the other. If we examine the maggot from which the wasp is hatched, we shall find that it much resembles the earth-worm, but as it grows there are fewer rings around the body. [The similarities and differences of the three animals named were described at length.] They have at the commencement these things in common—a cylindrical body divided into a number of joints, which are moveable one upon the other. We have therefore reached the general proposition that all these animals have a common structure; that they are all built upon a common plan, and that the elements of the structure, the architecture of it, consists merely in the combination of rings. The difference arises only in the progress of growth, and they increase in every region until we have as complicated an animal, superior to the worm, as the lobster is superior to the bee or wasp. How was the discovery of these facts accomplished? First by an observation singly of these things, one independently of the other; then by a comparison of their different stages of growth with one another; then by a comparison of all the successive stages of growth of one with the successive stages of growth of the other; then by comparison of all the features with one another; and then we reached the general conclusion that there was but one plan of structure of the whole; but as soon as we have reached this generalization, we have at once also come to the conviction that between animals organized on this plan, there can be no similarity to the animals organized on any other plan. We find that our frame is built in a very different way. If we begin to analyze the difference, then we see that what distinguishes man is his head and

brain, his middle body and limbs. It would not be a difficult thing to show that the same bones are found in quadrupeds as in man; and that their limbs and organization correspond. It only shows that the Great Architect knew how to apply the same means to purposes as different as walking and flying. Even in fish the fins are only modified arms and legs, and are constructed on the same plan of arrangement, as may be distinctly traced by any person who would for a moment establish a comparison for himself, by not merely speaking these things, telling them in a school-room—only where the bodies of the animals are at hand to show them. If you use a specimen in place of a text-book, you will exhibit the similarity which exists between animals constructed on this plan, and you will introduce the most secure foundation for generalization which you can secure. You will have shown that the back-bone of the fish is the same as that which supports our frame; that the bones which form the ill-shaped and elongated head, are the same which form our skull and brain, and that the fin which is attached is only a modified arm. It is only in reference to special adaptation that the differences are introduced. I have entered into details to show you that such objects exhibited and compared will suggest ideas, and will lead to the training of the mind in a much more effective manner than by any study of mere text-books of general propositions and sentences. And yet I consider that of the utmost importance. Let me not be understood as if I thought that the study of writers was not of importance. It is only in developing all our faculties, with making man what he may be, it is only in giving to his mind that noble development of his faculties that we urge this object. If we cultivate the imagination and the memory, and thus cultivation of the senses is neglected, the ability of observing is neglected, and all those abilities which man may acquire by the culture of his senses, by the art of observing, are left untrained. The great element of education is left out of our system; that which appeals to the senses; that which appeals to the power of observing; that which requires activity of manipulation, and while only the imaginative faculties and the memories are cultivated, the other faculties are left starving. In our age, while the study of natural history is so manifestly necessary to the work of men, add that means to the culture of schools; and do it as soon as it is possible to educate the teachers who will be capable of imparting information; and that can be done easily, by following the wise method which has been adopted in every other branch. When physical geography was introduced into our schools, how was it done? One man went about from school to school and gave instruction in that one branch, and his pupils are now teachers. Send us a few scholars who have aptitude for that study in our principal schools

in which we teach natural history, and in the teachers' institutes, and in the schools themselves, let them show what can be taught, and very soon the spirit will be caught and will spread, and in a few years we may have our system of education embodying that branch of study, and I verily believe it to be one of the most important additions which can be made to our system of education.

IMPORTANT TO EVERY ONE.

Exercise for the body, occupation for the mind—these are the grand constituents of health and happiness, the cardinal points upon which every thing turns. Motion seems to be a great preserving principle of nature, to which even inanimate things are subject; for the winds, waves, the earth itself, are restless, and the waving of trees, shrubs, and flowers is known to be an essential part of their economy. A fixed rule of taking several hours' exercise every day, if possible, in the open air, if not, under cover, will be almost certain to secure us from the attacks of low spirits, or *ennui*, that monster who is ever waylaying the rich and indolent.

ITEMS OF NEWS.

HUMBOLDT.—Baron Humboldt has addressed the following note to the Berlin journals:—"Overwhelmed by the numbers of letters sent me, and which are increasing every day, amounting to from 1,600 to 2,000 per annum—many, too, being on the most futile subjects, such as demands for my autograph, and offers to cure me of all diseases—I once more make a public appeal to the persons who wish me well, and request them not to occupy themselves so much with what concerns me, in order that with the diminution of strength, physical and intellectual, which I experience, I may be allowed a little leisure for study and composition. I trust that this step, to which I have recourse with reluctance, will not be interpreted unkindly."

RUSSIA.—A disagreeable sensation has been produced in official circles at St. Petersburg, by the declaration of the committee of the Government respecting emancipation, that the nobility express the opinion that this reform is intended to ruin the Russian nobles. The committee demand recompense for the lands ceded to the peasants, and advise the nobility to break off all communication with them. The document indicates a profound sentiment of bitterness and irritation.

CHINA.—The learned Russians connected with the college in Pekin, have recently announced that according to the last census returns, China contains a population of *four hundred and fifty-five millions*.

PAPER.—A French gentleman, an amateur in chemistry, has discovered a new mode of making paper. It is simply by boiling slices of wood with a certain quantity of mineral and vegetable alkali. If we may rely on the statement of the inventor, who intends to practice his method on a large scale, he can produce from 54 kilogrammes of slices of fir-wood, and 5 kilogrammes of alkali, a ream of very large paper as white as snow, and as fine as silk.

THE RAPID GROWTH of Leavenworth city, Kansas, is astonishing. Although only four years old, it con-

tains a population of 10,460, and an assessed valuation of \$3,871,375. It has nine churches, ten schools, four daily and four weekly papers, seven job printing offices, eighty-nine lawyers, and forty doctors.

THE SLAVE TRADE.—The State Assembly of New York, by a very strong vote, has passed the following resolutions in regard to the re-opening of the Slave-trade:

"Resolved, If the Senate concur, that the citizens of this State look with surprise and detestation upon the virtual opening of the Slave-trade within the Federal Union; that against this invasion of our laws, of our feelings, and of the dictates of Christianity, we solemnly protest; that we call upon the citizens of this Union to make cause in the name of religion and humanity, and as friends of the principles underlying our system of government, to unite in bringing to immediate arrest and punishment all persons engaged in the unlawful and wicked trade, and hereby instruct our Senators and Representatives to Congress to exert all lawful power for the immediate suppression of the infamous traffic.

Resolved, That the Executive of this state be required to transmit a copy of this resolution to the Legislatures of the several States of this Union, and earnestly request their co-operation in arresting this great wickedness."

EXTENT OF THE AFRICAN SLAVE TRADE.—From information received in Washington, it appears that the business of importing Africans is far more extensive than has heretofore been supposed, and that the arrangements for that purpose are very ingeniously devised.

Small boats are employed to relieve slavers of their cargoes and bring them into the Southern States.

AMERICAN BOOKS IN THE BRITISH MUSEUM.—An article in a recent number of the *Edinburgh Review* relates some curious facts about the contents of the library of the British Museum. It appears that a number of gentlemen have been employed twenty years upon a new catalogue of the books. It has already reached the size of two thousand folio volumes. There are forty miles of book shelves. There are five hundred and sixty thousand volumes. This is, perhaps, the largest library in the world; though the Bibliotheque Imperiale, at Paris, has eight hundred thousand separate volumes and pieces. The Museum has a collection of about thirty thousand books published in the United States, which is more than double the extent of any similar collection of *American* books in our own country.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is inactive, and prices are unchanged. We quote sales of superfine Flour at \$6 12 a 6 62½ and \$6 75 a 6 25 for extra family. The sales to the retailers and bakers are within the range of the same figures. Sales of Rye Flour and Corn Meal continue limited. The former at \$4 18 per bbl. Corn Meal is held at \$3 87, for Pennsylvanian, and \$4 12 for Brandywine.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 54 a 1 56 per bushel for fair and prime red, and \$1 60 a 1 65 for white in store. Rye is in demand, and sells for 85 cents. Corn is in demand; sales of yellow at 87 cents, afloat. Oats are in better demand; sales of prime Pennsylvania at 52 a 53 cents, and Delaware and Jersey at 51 cents. Barley Malt, \$1.

CLOVER SEED.—Sale at \$5 00 a 5 25 per 64 lbs. for fair and good quality, and \$5 50 a 6 00 from second hands. No further sales of Timothy or Flax seed.

HIGHLAND DALE.—Charles and Catharine Foulke inform their friends that their house will be open for the reception of boarders, early in the 6th month. It is an elevated situation, one mile from Stroudsburg, and four miles from the Delaware Water Gap.

The cars leave Walnut Street wharf every morning for Stroudsburg.

The price of board in 6th and 7th months, will be \$6 per week, and in the 8th month, \$7 per week. Children under 12 years, half price.

4th month, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks,

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HERBY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next session of this Institution, on the 2d of 5th mo. next. For reference and further particulars, enquire for circulars of Principal,

BENJAMIN SWAYNE.

London Grove, 22d of 3d mo., 1859.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON,

MAGGIE B. JACKSON,

Assistants.

Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER,

SUSANNA G. CHANDLER,

Proprietors.

3d mo. 19, 1859.—10 t.

ELDRIDGE'S HILL BOARDING SCHOOL FOR THE EDUCATION OF YOUTH OF BOTH SEXES.—All the branches of a liberal English Education are thoroughly taught in this Institution. Also the French and Latin languages.

The summer session will open on the 3d of 5th mo., 1859, and continue 20 weeks, terms \$70 per session.

For full particulars address the Principal for a circular.

ALLEN FLITCRAFT,

Eldridge's Hill, Salem County N. J.

2 mo.

ORANGE GREEN BOARDING SCHOOL FOR GIRLS.—The Summer Term will commence on the 11th of 4th month next. The location is unusually healthy and pleasant; the course of study extensive and thorough. Terms Thirty-six Dollars per session of thirteen weeks.

For particulars, address Principals,

SIDNEY PUSEY, or

FANNY A. KINSEY.

Kennett Square, Chester Co., Penna.

2d mo., 1859.—2m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FOURTH MONTH 30, 1859.

No. 7.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

On Repentance and Conversion.

James. I feel desirous of information respecting some of the principal doctrines of Christianity;—for the great variety of opinions which prevail among the professors of religion, and the bitterness which some of them appear to feel towards others, have had a tendency to weaken my faith, and I have no doubt they have produced discouragement in the minds of many others.

Father. It must be acknowledged that a great diversity of opinion does exist upon many points of doctrine; but this should not weaken our faith in the reality of *vital religion*; for a great variety of opinions may be found among men in most departments of knowledge. The greatest philosophers have often been mistaken by founding their systems upon speculations and conjectures, instead of watching the operations of Nature, and reasoning from facts. And it is in this way that many professors of religion continue to err, by attaching too much importance to the conjectures they have formed about religion, and by attending too little to the operations of the Spirit of Truth in their own minds; by obedience to which they might become experimentally acquainted with vital religion, and “renewed in knowledge after the image of Him that created them.” Notwithstanding the great variety of doctrines among the professors of Christianity, I could easily prove to you from pious and experienced writers of every sect that I am acquainted with, that they all agree in regarding true religion as a work of the heart

rather than of the head; and the experience of all ages proves that “the grace of God *which bringeth salvation* hath appeared to all men, teaching us that denying ungodliness and worldly lusts, we should live soberly, righteously, and godly in this present world.” The operation of this Divine Power, when it is submitted to, brings about in our minds the great change, which begins with repentance for our past sins, and ends in conversion or regeneration.

John. These are subjects on which I wish for information, for I have lately thought much about them, and I trust my heart has been in some measure weaned from the world, and engaged in the pursuit of that inheritance, incorruptible and undefiled, that fadeth not away.

Father. I am rejoiced to hear that the Lord has been so gracious to thee, my son, and that he is calling thee out of darkness into his marvellous light. He has, I trust, granted thee “repentance unto life,” which is the first step in the path of righteousness. Like the passage of the children of Israel through the Red Sea, the baptism of repentance separates us from the land of Egypt, saves us from a host of our enemies, and fills the soul with joy, so that we can sing the song of Moses, and “make melody in our hearts unto the Lord.” But the Israelites, after their first deliverance and rejoicing, had a great many trials to encounter, and a long journey to perform through the wilderness, until that crooked and perverse generation which *was born in Egypt*, was wasted away or consumed; and then there was a captain raised up in the midst of them, who led the new generation through Jordan (the river of judgment) into the promised land. The work of repentance was also typified by the watery baptism of John; but true saving baptism is “not the putting away of the filth of the flesh, but the answer of a good conscience towards God.” 1 Peter iii. 21. And this saving baptism is administered by the Holy Spirit, which comes into the heart, and purifies or “sprinkles it from an evil conscience.” Repentance is the gift of God,—and it is offered to the acceptance of all men; for all are visited with seasons of calm reflection and serious thoughtfulness, when their sins are “set in order before them,” and all the pleasures of sense and the riches of this world seem “as nothing and vanity,” compared with that peace of mind which they have lost while pursuing after sha-

dows. This state of mind is sometimes experienced by those who are the most eager in pursuit of pleasure and worldly glory; but they too generally put it from them, and fly to amusements or business to drive it away. Yet this very thing which is so much shunned, is nothing less than a visitation of Divine Love, which, if yielded to, would lead to eternal salvation. It is indeed the voice of Christ, who says, "Behold, I stand at the door and knock; if any man hear my voice, and open the door, I will come in to him, and will sup with him, and he with me." Rev. iii. 20.

Those who yield obedience to this heavenly vision, not consulting with flesh and blood, will experience the baptism of repentance to take place in their souls, for "godly sorrow worketh repentance to salvation;" and the only sure evidence of sincere repentance, is bringing forth fruits "meet for repentance."

James. Does not repentance often take place without any fruits? It appears to me that I have been sinning and repenting for many years, without much, if any amendment.

Father. There is a spurious kind of repentance that hardly deserves the name;—it does not proceed from a true sense and *hatred of sin*, but from a *dread of punishment*, which induces men very often "to feel a transient regret for what they have done, and to take up resolutions to do better in future; but these resolutions, when made in man's own strength, and with a *reliance upon his own arm* for their execution, will not stand in the hour of temptation; the first gust of passion will blow them away. True repentance implies not only a godly sorrow for sin, but a turning away from it. It implies a returning again to Him from whom the soul has revolted. "Repent," says the prophet, "and turn yourselves from all your transgressions: so iniquity shall not be your ruin." Ezekiel xix. 36.

John. I have no doubt that true repentance is a work of the divine Spirit in the soul, and that it is accompanied by forgiveness of sins through the mercy of God. But I have been led to believe that the joy and peace which I have found springing up and abounding in my heart, was an evidence not only of forgiveness, but of conversion and regeneration.

Father. The term conversion is often used as equivalent to regeneration, and then it signifies a change of heart from a state of sin to a state of holiness,—a putting off the old man *with his deeds*, and putting on the new man, which is renewed in knowledge "after the image of Him that created him." It was used in this sense by Jesus himself when speaking to Peter, just before he was delivered up: "Simon," said he, "satan hath desired to have you, that he may sift you as wheat: but I have prayed for thee, that thy faith fail not; and when thou art con-

verted, strengthen thy brethren." Luke xxii. 31, 32.

John. It appears from this passage, that Peter had not yet been converted; and it becomes an interesting inquiry for us all to *know* what was then the state of his experience, and how far a man may progress in religion without being thoroughly converted.

Father. Yes, it is a very interesting subject for inquiry,—and there are a number of passages in the New Testament that will throw some light upon it. It appears that Peter, long before this, had forsaken all, in order to follow Christ. He had been one of his disciples nearly three years. He had listened to his preaching and conversation, and beheld his miracles and holy example. He had himself been sent forth to preach, saying, "The kingdom of heaven is at hand," and he had been entrusted with the power of healing the sick and casting out devils. He had also been with his divine master in the hour of prayer, and stood by him on the mount of transfiguration, when "his face did shine as the sun, and his garment was white as the light," and "there came a voice from the excellent glory, saying, This is my beloved Son, hear ye him." Nor was Simon's experience altogether of an outward character; for when he confessed that Jesus was the Christ, the son of the living God, his master replied, "Blessed art thou, Simon Bar-jona; for flesh and blood hath not revealed it unto thee, but my Father which is in heaven." Yet it appears that notwithstanding all his precious opportunities, and his ardent love for Christ, Peter had not yet been thoroughly converted.

John. I am almost ready to say, this is hard doctrine, who can bear it; for if Peter, after all this experience, had not been converted, how can one so young and weak as I hope to attain that blessed state?

Father. Be not discouraged, my son. He who hath begun a good work in thee, is able and willing to carry it on and complete it. All he requires on thy part is, *watchfulness* to know his will, *obedience* to follow it, and *patience* to endure his righteous judgments. Every victory over sin, and every escape from temptation, is accompanied by an immediate reward of "joy in the holy spirit;" for he "feeds his flock like a shepherd, he gathers the lambs with his arm and carries them in his bosom."

Conversion does not depend upon the abundance of our knowledge, but upon the subjection of our wills to the Divine government. This brings us into a teachable, humble, childlike state;—for "except ye be converted, and become as *little children*, ye shall not enter into the kingdom of heaven."

John. Is there any evidence in the scriptures that Peter was not in this state, except the passage alluded to?

Father. Yes; there are several circumstances

related of him, which show that he was still governed by his own will, and had not been "transformed by the renewing of his mind;"—for instance, when his master said to him, "Whither I go, thou canst not follow me now, but thou shalt follow me afterwards,"—Peter answered with much confidence, "Lord, why cannot I follow thee now? I will lay down my life for thy sake." But it appears that his confidence in himself was entirely misplaced, for when the hour of trial came, he not only denied his master thrice, but "he began to curse and to swear, saying, I know not this man of whom ye speak." Mark xiv. 71.

John. Perhaps this instance of humiliating weakness came upon him in consequence of his having so much confidence in himself, that he did not continue in watchfulness and prayer.

Father. Yes, there is no doubt of it,—and there is no safety for the most experienced Christian, but in a state of continual reliance upon Divine aid, which is always afforded when rightly sought for. "God is faithful," says the apostle, "and will not suffer you to be tempted above that ye are able, but will with the temptation also make a way to escape, that ye may be able to bear it." 1 Cor. x. 13.

James. Was there no other part of Peter's conduct that indicated the state of his mind?

Father. Yes, there was. It appears that when Jesus began "to show unto his disciples, how that he must go unto Jerusalem, and suffer many things of the elders, and chief priests, and scribes, and be killed, and be raised again the third day; then Peter took him and began to rebuke him, saying, Be it far from thee, Lord; this shall not be unto thee. But he turned and said unto Peter, Get thee behind me, satan; thou art an offence unto me, for thou savourest not the things that be of God, but those that be of men." Matt. xvi. 21–23. This conduct of Peter arose from his not understanding the nature of Christ's kingdom; which can only be understood by coming under the government of the spirit of Christ. When Jesus "was demanded of the Pharisees, when the kingdom of God should come, he answered them and said, The kingdom of God cometh not with observation. Neither shall they say, Lo here! or lo there! for behold, the kingdom of God is within you." Luke xvii. 20, 21. But although Peter had experienced the baptism of repentance, which was typified by the watery baptism of John, he had not yet been introduced into the spiritual kingdom of Christ; for "the least in the kingdom of heaven is greater than John." Notwithstanding he had heard this doctrine preached, and seen it exemplified in the meek, non-resisting example of the Saviour, his mind was still veiled by the prejudices of education, and he expected the Messiah to reign as a temporal prince, to subdue their outward enemies, instead of waiting in prayer

that his power might be revealed in them, to subdue their spiritual enemies. It was therefore expedient for them that he should go away, in order that the "Comforter, which is the spirit of Truth, might come and lead them into all truth." This Comforter is the manifestation of the same Divine life and light which dwelt in him; for "in him was life; and the life was the light of men: that is the true Light which lighteth every man that cometh into the world." John i. 4–9.

John. And did not Peter show that the natural man was still prevalent in him, when he took a sword and smote off the ear of the high priest's servant?

Father. I think that was a very strong evidence that his heart had not been thoroughly brought under Christ's government, for the same spirit will always bring forth the same fruit. Now, the fruit of the Divine spirit "is love, joy, peace, long suffering, gentleness, goodness, faith, meekness, temperance: against such there is no law" Gal. v. 22.

James. I think Peter was very much like the professors of Christianity at the present day. He had not faith to suffer with Christ, but he was willing to fight for him.

Father. Yes: for he could fight without taking up the cross of self-denial. But how different was the conduct of the holy Jesus! for he "touched the servant's ear and healed it," saying, "Put up again thy sword into his place; for all they that take the sword shall perish with the sword." Matt. xxvi. 52.

James. Perhaps Peter had mistaken his master's meaning, when he told them a little before, "He that hath no sword, let him sell his garment and buy one."

Father. It is very probable he did mistake it, as he was not then in a state of mind to understand spiritual things;—but his mistake was soon corrected, for when they said, "Lord, here are two swords," he replied, "It is enough," thereby intimating that he did not mean carnal weapons.

On considering the whole paragraph, in connexion with the precepts and example of Christ, it is plain, that he intended only to warn them that a time of deep trial was approaching, when they would need the whole of that spiritual armor which was afterwards described by the apostle as the "whole armor of God." "Stand, therefore," says he, "having your loins girt about with truth, and having on the breast-plate of righteousness; and your feet shod with the preparation of the gospel of peace; above all, taking the shield of faith, wherewith ye shall be able to quench all the fiery darts of the wicked; and take the helmet of salvation, and the sword of the Spirit, which is the word of God: praying always with all prayer and supplication in the Spirit, and watching thereunto with all per-

severance and supplication for all saints." Eph. vi. 13-18.

These are the weapons of the Christian's warfare, and these were the weapons that Christ himself made use of. He overcame hatred by love, he conquered pride by meekness, and he triumphed over error by the spirit of Truth. He taught his disciples to resist not evil, but "when smitten on one cheek to turn the other also." "Love your enemies," said he, "bless them that curse you, do good unto them that hate you, and pray for them that despitefully use you and persecute you." "If you love them that love you, what reward have you? do not even the publicans the same?" But "be ye perfect, even as your Father in heaven is perfect; for he maketh his sun to rise on the evil and the good, and sendeth rain on the just and on the unjust; and he is kind even to the unthankful and to the evil." These sublime precepts of Jesus were exemplified in every act of his spotless life, for "when he was reviled he reviled not again, and when he suffered he threatened not, but committed himself to him that judgeth righteously." 1 Peter ii. 23. "To this end was I born," said he, "and for this purpose came I into the world, that I should bear witness unto the truth," John xviii. 37. These glorious truths were taught in his discourses, confirmed by his example, and sealed with his blood. "As a sheep before his shearers is dumb, so he opened not his mouth," but patiently bore all the sufferings that their iniquity inflicted upon him; and his faithfulness under sufferings was not only a sacrifice acceptable to God, but also an example to us. "For," says the apostle, "what glory is it, if when ye be buffeted for your faults, ye shall take it patiently? But if, when ye *do well*, and suffer for it, ye take it patiently, this is *acceptable with God*: for even hereunto were ye called; because Christ also suffered for us, leaving us an example that we should follow his steps." 1 Pet. ii. 20, 21.

James. But, father, it seems to me, that if we were to follow this example and these precepts, we should be very often imposed upon and injured by the wicked.

Father. This was the very objection that the unbelieving Jews started in that day; for they said, "If we let this man thus alone, all men will believe on him, and the Romans will come and take away our place and nation." So they put him to a cruel and ignominious death; nevertheless the Romans did come, and take away their place and nation.

(To be continued.)

Whoever feels pain in hearing a good character of his neighbor, will feel a pleasure in the reverse. And those who despair to rise in distinction by their virtues, are happy if others can be depressed to a level with themselves.

"BE CLOTHED WITH HUMILITY."

"I PRAYED for direction, and saw clearly, that plainness of dress and behaviour best became a Christian, and that for the following reasons:—

1. The Apostle expressly forbids women professing godliness to let their adorning be in apparel, allowing them no other ornament than that of a meek and quiet spirit.

2. I saw the reasonableness of the command, and proved it good for a proud heart to wear the plain and modest livery of God's children.

3. It tended to open my mouth, for when I appeared, like the world, in Babylonish garments, I had its esteem, and knew not how to part with it. But when I shewed by my appearance that I considered myself as stranger and foreigner, none can know (but by trying) what an influence it has on our whole conduct, and what a fence it is to keep us from sinking into the spirit of the world. For there is no medium; they who are conformed to the fashions, customs, and maxims of the world, must embrace the spirit also, and they shall find the esteem they seek, for the world will love its own. But let them also remember this word, 'The friendship of the world is enmity with God.'

4. I saw myself as a steward, who must render an account for every talent, and that it was my privilege to have the smiles of God on every moment of my time or penny of money which I laid out.

5. I saw clearly that the helping my fellow-creatures in their need was both more rational and more pleasant than spending my substance on superfluities; and as I am commanded to love my neighbor as myself, and to consider all done to the household of faith as done to Christ, surely I ought not only to suffer my superfluity to give way to their necessity, but also (as occasion may require) my necessities to their extremities.

6. But it is not only the talent of money, but of time, which is thrown away by conformity to the world, entangling us in a thousand little engagements, which a dress wholly plain cuts through at once.

7. The end usually proposed by young persons in their dress, is such as a devout soul would abominate. A heathen may say it will promote my being comfortably settled in life; but I believe the Lord appoints the bounds of our habitations and that '*No good thing will he withhold from those who walk uprightly.*' I have therefore nothing to do, but to commend myself to God in holy obedience, and to leave every step of my life to be guided by His will. I will therefore make it my rule to be clean and neat, but in the plainest things, according to my station; and whenever I thought on the subject, these words would pass through my mind with power, '*For so the holy women of old adorned themselves.*'"

MARY FLETCHER.

From the London Friend.

MEETINGS FOR WORSHIP.

To those who are feeling the irksomeness of frequent silent meetings.

Dear Friends,—Do you go to your meetings for worship with a real expectation of deriving some benefit from so doing? Do you go with any intelligent expectation of there performing an act of worship to the Almighty? A heathen goes to his idol temple, prostrates his body, makes some offering, and leaves the place with the full persuasion that he has done acceptable service to his gods, and he feels comfort in the belief that he will enjoy their protection. Brought up in this way of thinking and acting, we need not be surprised at his blindness. But we do need to be surprised, ashamed, and deeply abased, and to feel ourselves far below the level of the heathen, if, with pure truth presented to us in the Bible, and in the words and lives of many around us,* we go to our places of assembly, take our seats, and, while we properly omit outward ceremonial observances, such as the poor heathen's bodily prostration and offering, omit also that prostration of the soul before its Maker which constitutes the worship due from weak, erring mortals to a God of infinite power and holiness, in whose hands our breath is, and to whom we shall one day have to give an account for all the actions of our lives. It is true that this prostration of mind is an act of which we are utterly incapable in our own strength, but it is our own fault if we pay no heed to the truth that Jesus Christ is always at hand, ready, if we turn prayerfully to Him, to enable our spirits to turn to God. He said, "Lo, I am with you always, to the end of the world;" and Paul said, "Know ye not that Jesus Christ is in you, except ye be reprobates?" John said, "Ye have no need that any man teach you, but as the same anointing teacheth you, which is truth and no lie." John also said of Christ, that he "was the true light that lighteth every man that cometh into the world." David said that he saw the Lord always before his face, and felt that He was at his right hand. Jesus Christ is as truly in the world now as he was in the reign of Tiberius Cæsar, and he is as accessible to his disciples of this day as he was to Peter, James, and John, then; he is still able and willing to be the food and the light of his followers, and we have this precious additional encouragement to meet together for worship, "Where two or three are gathered together in my name, there am I in the midst of them." Not only is Jesus in each of us, but he is, as it were, specially present when we meet together to worship God in his name. No one, therefore, can have any excuse for not worshipping God; for we have a heavenly guest always

at hand, even Jesus Christ, manifested now not as flesh and blood, but as the Holy Spirit, who will help our infirmities, and supplicate with us and for us in groanings that we can find no words exactly to express, but which are clear intelligible language to our God.

Unless we go to our meetings with a measure of the same faith in being fed as when we go to a meal, of being cured as when we consult an eminent physician, of being warmed as when we go to a fire, of being instructed as when we go to a lecture, of being cleansed as when we perform ordinary ablutions, we shall go in vain; for there is One present who can do all these things for us, and if we look to Him only in faith, more of us than at present will be concerned to exhort others to follow after the same things; and every one going without any looking forwards, but looking only for the inward teaching of Christ, words will flow more copiously than at present; for if each goes to the source whence all true ministry proceeds, it is to be expected that there will be more of that ministry than there will be when a few go to the fountain-head, and all the rest look to them to be supplied with their spiritual refreshment.

R. V.

He that has never known adversity, is but half acquainted with others, or with himself. Constant success shows us but one side of the world. For as it surrounds us with friends who will tell us only our merits, so it silences those enemies from whom alone we can learn our defects.

TANNERS'S LECTURES.

(Continued from page 23.)

Some of the disabilities consequent on the refusal to swear have been continued to the present generation; but Friends were relieved from the suffering in which their refusal of the oath of allegiance had involved them, by the 1st of William and Mary. Another Act, passed in the reign of William the Third, allowed our members to use a form of affirmation instead of an oath, on most occasions on which the law required the taking of an oath. This first form of affirmation, which continued in use until the year 1721, when a more simple declaration was substituted for it, was as follows:—"I, A. B. do declare in the presence of Almighty God, the witness of the truth of what I say." It need not occasion any surprise, that Friends should have been divided in opinion as to whether these words constituted an oath or not. The Yearly Meeting in London gave the following excellent advice on the subject: "That Friends be charitable one to another about it: they that can take it (are) not to censure or reproach them that cannot; and those that cannot (are) to use the like

* And above all by the still small voice within—[ED. OF FRIENDS' INTELLIGENCER.]

caution with regard to those who can."* From their correspondence with the Meeting for Sufferings on the subject, Friends in Bristol appear to have felt no objection to the first form of affirmation, and to have desired that no attempt to obtain an alteration should be made, lest the liberty already granted should be endangered.

The history of this *case of conscience* affords an example, which should not be lost on the Society of Friends, of the extent to which those who are agreed in the adoption of a principle may differ as to the manner in which they ought to support it. I believe I shall never forget the powerful reference made to this subject by the late Samuel Tuke, in the Yearly Meeting of 1848. The grounds of Christian unity were laid down by him on that occasion, in a most truly catholic manner. He showed, among other things, that whilst that unity does not always bring men to see eye to eye, it prepares them to bear one with another in their differences; and he illustrated this position by a reference to the differences of opinion which arose among the Apostles themselves; and to the difficulty under which our early Friends labored for nearly forty years in determining what constituted an oath. I do not know that I ever listened to a discourse of which I should be so glad to possess a verbatim report.

Proceedings in relation to marriage occupied, apparently, more time in the first Meetings for Discipline than most of their other duties. There were few things in which the Christian boldness of George Fox and his associates was more exemplified than in the affair of marriage. One of the usurpations of ecclesiastical authority on the part of the Church of Rome, had been that of representing marriage as a *sacrament*, and of requiring all who would obtain legal validity to such an union to apply to the priest to solemnize it. That the chief object of this arrangement was that the priest should obtain his fees, was further shown by the circumstance that, whilst the Cannon Law proscribed the marriage of near relations, the income of the priest was still further augmented by the many payments made to him, in consideration of his setting aside such restrictions. Now, although the Church of England had renounced the error of accounting marriage as a sacrament, its ministers were generally † looked upon in the days of George Fox (and are so still by many persons) as the only parties by whom marriage could be rightly solemnized. So strong was the belief that legal

validity could not be obtained for a marriage contract by any other means than by going "to church" to be married, that Roman Catholic and protestant dissenters resident in England, were alike accustomed, up to a very recent time, to waive whatever objection they might have to employing a minister, or submitting to the marriage ceremony of the Church of England. It was no common responsibility which rested on George Fox when he counselled his Friends not to do anything of the kind, but to proceed simply in this affair of marriage, as in everything else, in the fear of God, and in single dependence on His blessing. It seems to me that if a *temporising spirit* had found any place in his mind, he would have given way on this question of marriage, on the plea that the clergyman might be applied to as the person appointed by Government to perform the marriage ceremony without any admission of the spiritual claim; and if he had done so, who can say that the legal sanction given, under the act of 1837, to other marriages besides those of the Church of England, would not have been indefinitely postponed? Few men have practically reversed Paley's doctrine that "whatever is expedient is right," so completely as George Fox. He believed that in the affairs of marriage, as in other things, the ministers of the Church of England set up a claim, against which he was called to testify. And if he did stop to count the cost, and to consider what the consequences might be to himself and to his brethren, there are certainly no symptoms of doubt or hesitation to be observed in his words or actions.

His belief on this subject, as declared by him on different occasions, was, that man had no authority to joins others in marriage—that neither the priest under the law, nor the first ministers of the Gospel exercised any such function; that it was God who joined man and woman in marriage before the fall, and that this is still His prerogative, &c. So early as the year 1653, he issued a paper of advice to Friends who were contemplating marriage to lay their intentions "before the faithful in time, before anything was concluded, and afterwards publish it in the end of a meeting, or in a market."*

The question of the validity of Friends' marriages was raised on one occasion before Chief Justice Hale, who said that "he thought it rea-

*I find this expression quoted in a manuscript book of the advices of the Yearly Meeting of Pennsylvania and New Jersey, which was sent by John Churchman to John Player of Tockington, and is now in the possession of his daughters, Fanny and Mary Player. Thomas Story suffered eighteen months' imprisonment, because he could not use the first form of affirmation.

† In the time of the Commonwealth, marriages sometimes took place before magistrates.

* Journal, p. 395.—An original letter of George Fox's, written whilst the subject of marriage was under his consideration, has been kindly lent me. It is addressed to Richard Richardson, schoolmaster, Wheeler Street London. Geo. Fox says—"Now, dear R. R. I desire that thou would search all the libraries concerning marriage, and what they do say of them; and the Fathers, and how they did before the monks first came in; and when marriage with the priest came in; and search histories and laws, and see what thou canst bring out both good and bad and what maketh a marriage—and do what thou canst in this thing," &c.

sonable, and consistent with natural rights and the precepts of the Gospel that all marriages made according to the several religious persuasions of the parties ought to be valid in law."

Other judges expressed a similar opinion on different occasions; but it was not until the passing of the Act introduced by Lord Campbell in 1847, that the marriages contracted by Friends prior to the Marriage Act of 1837, received the positive sanction of statute law.* In 1707, more than fifty years after the first solemnization of marriage in the Society,* the Meeting for Sufferings advised Friends to make their wills in such a way as not to raise the question of the validity of their marriages. It was recommended that in such documents the wife should be described by her maiden, as well as by her married name, &c.

There is no reference to the consent of parents in the earlier Bristol minutes in relation to marriage, and the meeting seems only to have concerned itself with the question of the orderly conduct of the parties, and with such publication being made before the marriage as might afford an opportunity for any one to object who had a right to do so. In the eighth month of 1669, G. Fox and Margaret Fell, the widow of Judge Fell, declared their intention of marriage to the Bristol Meeting, and on that occasion several of Margaret Fell's children, who were present, expressed in strong terms their approval of the proposed union. This may, perhaps, have suggested to Friends here the propriety of ascertaining in other cases that the consent of parents was given.

At all events such consent began to be recorded soon afterwards. It is also possible that in the conscientious care manifested by George Fox not to interfere with the pecuniary interests of the former marriage, may have originated the care which Friends here also began to take shortly after to secure the like benefit in other cases. In the form of the certificate agreed to, marriage is spoken of as "God's ordinance." During the time of the last persecution in Bristol, publications of marriage were frequently made at Newgate and Bridewell, the regular meetings for worship being closed. *The prisons* may indeed be said to have been *places of worship* in those days. The regular holding of the Meetings for Discipline was also often interrupted. Sometimes they were held in private houses, word being left with the prisoners where the meeting would be held, that Friends who wished to ascertain it might do so by calling at the prison.

In many cases the publication of the marriage was the only means taken to ascertain whether any obstruction existed to its solemnization: but when the parties making application were but little known to the meetings, or had been guilty

of disorderly conduct, committees were appointed to make inquiry respecting them. There was, for the most part, a disposition shown to form a charitable judgement of such applicants; and in some cases in which their conduct would not permit of their being recognised as Friends by being allowed to marry at meeting, an *intermediate* course was adopted, as appears by the following minute of the Two-weeks Meeting in Bristol, in 1687:—"Whereas A. B. and C. D. have signified at a former meeting their intention of marriage, and desire to accomplish the same in the way and manner of Friends: but inasmuch as we find that the young man have not walked as a Friend, convinced of the truth which we profess, but rather so contrary thereunto, as that we have not freeness to countenance their marriage in the meeting, in the way and manner of Friends: yet, forasmuch as we do not find but that they may be clear from all other persons in relation to marriage, and that they may have their parents' consent, we do not see meet to concern ourselves to obstruct or hinder them; but shall leave them either to wait longer, for our better satisfaction, or to consummate the same as soon as they please, amongst such Friends as may be free to be present thereat: or otherwise, as they shall see meet."* In the year 1700 such a case occurred, in which the parties were allowed to marry "before witnesses in the meeting-house."

FAT MEAT AND DISEASE.

Dr. Dixon, in *The Scalpel*, assumes that the use of oil would decrease the victims of consumption nine tenths, and that this is the whole secret of the use of cod-liver oil. Dr. Hooker also sustains this opinion, in the following summary of observations: First—of all the persons between the ages of fifteen and twenty-two years, more than one fifth cannot eat fat meat; second—of persons at the age of forty five, all excepting one in less than fifty habitually use fat meat; third—of persons who, between the age of fifteen and twenty-two, avoid fat meat, a few acquire an appetite for it, and live to a good old age, while the greater portion die with phthisis before thirty-five; fourth—of persons dying with phthisis between the age of twelve and forty-five, nine-tenths, at least, have never

* Among James Dix's manuscripts is a report of a committee appointed in 1674 to consider what course should be adopted in certain cases, in which, though the conduct of the parties had been disorderly, the meeting might wish to avoid casting them off, and leaving them "open to the temptation of going to the priests" to be married. That committee recommended that if in such cases Friends were satisfied of the penitence of the parties, the marriage should be allowed to be solemnized before witnesses; and that a testimony to be issued by Friends against their misconduct, together with the declaration of their repentance, and the certificate of their marriage, should be copied together in the book containing the declarations of repentance sent by delinquents to the Men's Meeting

* Campbell's Lives of the Chief Justices, Vol. I, p. 558.

† The first marriage registered by Friends in Bristol took place in 1657.

used fat meat. Most persons who avoid fat meat also use little butter or oily gravies, though many compensate for this want, in part at least, by a free use of those articles, and also milk, eggs, and saccharine substances. But they constitute an imperfect substitute for fat meat, without which, sooner or later, the body is almost sure to show the effects of deficient calorification.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FOURTH MONTH 30, 1859.

S. M. Janney's "Conversations on Religious Subjects," a third edition of which was published in 1843, contains a clear exposition of religious truth, and in this day of serious inquiry its republication in our columns may be useful. We understand the edition has been exhausted.

DIED, 4th of 3d mo., ELIZABETH ANN, wife of William W. Tilton, a member of Shewsbury monthly meeting, New Jersey.

LETTER FROM SAMUEL J. MAY.

PÆSTUM, February 12, 1859.

My dear Friends: I wish you were here to partake of the pleasure I am now enjoying. We came, yesterday afternoon from Naples to Cava, and thence to Salerno—about 30 miles—and thence, this morn, in a carriage, 24 miles, to this site of the ancient Greek city of Pæstum.

I am now, at this hour of noon, seated upon a mass of rock, the ruin, no doubt, of some building, in front of what is called the Basilica, and just so as to command the best view of the Temple of Neptune, within sight of another temple, one-fourth of a mile off, that seems to stand in a line with these. The Temple of Neptune is the most entire, and is in every respect the grandest and most beautiful of the three. I shall bring home pictures of these most interesting ruins, and therefore shall not attempt here any description of them. They are all three strictly Grecian buildings, of the Doric order, bearing, therefore, a general resemblance to each other; and yet each has peculiarities that give to it an interest of its own.

I cannot describe what I am seeing; I can only tell you some of the feelings that are coursing through my bosom.

These buildings cannot be less than 2,500, or 3,000 years old. They tell of scientific attainments, artistic skill, æsthetic taste in some respects equal, in others superior, to those of our day. They tell of a large population once dwelling upon this beautiful plain. But no other vestiges of them remain, not even their burial places. Nothing remains of this once populous city but portions of the wall that surrounded it—heaps of

stone, which indicate where there were a theatre and an amphitheatre, and the foundations and pillars of these three beautiful temples.

We have lingered around these ruins for hours, admiring the beauty of their proportions, and longing to extort from them some more information of their origin and demolition, and of the history and overthrow of those by whose hands they were reared. But, although so full of expression, they were dumb; and we must leave them as we found them, silent witnesses that here a populous city once stood, which pestilence wasted, war emptied of its inhabitants, and time has well-nigh obliterated. Mosses and plants of various kinds are gradually creeping over these walls, and covering the floors they enclose. Lizards—emblems of desolation—are seen continually running in and out of the crevices that time has made in these walls and columns; and snails have planted themselves all about, as if assured that the foot of time will move more slowly than themselves in the utter demolition of these wasted ruins.

Salerno 8½ o'clock.

We all agree that the day has been spent delightfully. We rose at half-past 5, breakfasted at 6, and started in a good carriage, drawn by three horses abreast, at half-past 6. The sky was without a cloud, and the air bracing, but not cold, not colder than it is wont to be with us the latter part of May. Our road took us through a most picturesque country. The background was a distant range of ragged mountains, marked adown their sides by volcanic action, and their tops covered with snow. Nearer to us we have seen hills green all over with the foliage of the olive trees; and immediately on either side of our road, for the first twelve miles, were fields under the peculiar cultivation of the Italian peasantry, the land thrown into ridges, and bearing wheat or oats, already several inches high, or beans, or lupins, or other garden vegetables, all as far forward as the same kind would be with us at the last of May. Every now and then our eyes have been regaled by the sight of orchards of orange and lemon trees, laden with their fruits, and one garden wall lined with rose bushes, some of them in flowers.

After twelve or fourteen miles, we came to more sterile or less well cultivated tracks of country, some of them lying waste, open to the road, and others traversed by herds of neat cattle and tame buffaloes, which seem to be used in the same way as cows and oxen.

Everywhere we have seen women and girls working in the fields, the same as men, digging, hoeing, ploughing, bearing heavy burdens upon their heads. And they are to be seen in much greater numbers. So many men are absorbed by the Neapolitan army, the Roman Catholic Church, and are occupied in the fisheries and coasting trade, that the women are left to do the farming

and gardening; yes, and severer labor, too. Between Cava and Salerno, the King is making a railroad. It is to run, much of the way, along the ledges of the rocky mountain range, overhanging precipices, crossing deep gorges and ravines, and therefore requiring a vast amount of hard digging and heavy masonry. Yet we saw, all along the way, women and girls handling stones and carrying baskets of dirt upon their heads, not knowing the use of wheelbarrows.

As you will now be ready to believe, the Italian peasantry and laboring people are a very coarse, hard looking set. They are, many of them, about as dark-complexioned as our Onondaga Indians, and as dirty in their personal appearance and domestic habits. Their dwellings are not much, if any, larger, seldom more than one story high, built of stone, and covered with a cement that looks like stone and is almost as hard; or they are rooms excavated in the rock at the base or on the sides of the mountains, whose slope these poor people cultivate, wherever there is soil, and where a terrace can be built. They have few, if any, windows in their houses, and depend for the light and air they need upon the open doorway.

The farming and domestic utensils of these people are of the rudest sort. Their hoes, shovels and axes no Yankee would deign to use; and their plough is nothing but a pointed stick fastened in the pole to which the oxen or donkeys are attached, at an angle of 30 or 35 degrees, the other end held by the driver, so as to guide the point to make the furrow or scratch in the ground which he intends.

Almost all the women that we have seen, who were not employed in the fields or on the roads, were wielding the distaff, and diligently spinning flax, in the scriptural and classic manner. It was pleasant to see the simple process, and J. E. tried his hand at it, but found it required an art or slight of hand which he did not possess.

AMALFI, Feb. 18.—To-day we have had a more delightful ride than ever before. We have come from Salerno to Amalfi, about 20 miles, passing several villages and two large towns. We were brought in a good coach drawn by three smart horses, over the post-road made by order of the King and opened in 1853. This road, though not quite wide enough, is admirably built, high upon the water, along the very precipitous side of the range of jagged, craggy mountains that all along the way overhang this northern shore of the Bay of Salerno. No description could give you an adequate idea of the winding, tortuous course of this remarkable road, much less of the picturesque scenes that were continually bursting upon our sight as we turned the often very acute angles that are made by the irregularities of this mountainous range. Now above us, now below, villages or smaller groups of houses were seen, standing in what seemed the most im-

practicable places. There are no mountains in our country, that I ever saw, which resemble these—none so jagged, peaked and every way irregular, and so often bald withal. Yet have we seen to-day villages, and large orchards of oranges and lemon trees, built upon terraces, one above another, up to a dizzy height; and often solitary villas or monasteries or old castles standing upon pinnacles so abrupt that the ascent to them must be most laborious, to the infirm impossible. I would not live in such places, but they make very attractive pictures.

Amalfi, where we shall pass to night, was once a large, important city, containing 50,000 inhabitants. There are now only about 7,000. These are employed, for the most part, in the manufacture of paper, soap and macaroni. There is also a cathedral here, under which lie buried the remains of St. Andrew, the patron of the city.

Amalfi is a queer place, built upon the ascent of a very steep mountain side. I clambered up, with one of our travelling companions, more than 200 feet above the foundations of our hotel, through narrow, paved lanes, up narrower stone stairways, between blocks of houses three or four stories high, and then saw terraces of houses almost as much higher still. When we reported, over our supper table, what we had discovered, we were told that the other members of our party had been exploring the city in another direction. They had descended from our hotel through one narrow street after another, fifty or sixty feet, as they estimated, and saw other alleys still leading downwards. They stayed their course at a church in which they found many poor women and children at evening prayer. Quite a number of them left their devotions to beg "grane" of the strangers. Amalfi is somewhat distinguished, even in southern Italy, for the paupers who infest the streets, and haunt especially the spots where travellers are likely to come. Indeed, everywhere in southern Italy the pleasure of travelling is seriously impaired by the importunity of beggars.

Our hotel—La Luna—was formerly a monastery. We are occupying one of the sitting rooms of the "Holy Brethren," and shall sleep to-night in their cells. Upon the ceiling, over one of our narrow beds, is a picture of the Virgin Mary, who seems to be more adored in this part of Italy than God or Christ. The walls of the house and the partitions are all stone, and only whitewashed, so that it appears more like a prison than a dwelling for honest men. Nevertheless, I trust our sleep will be sound and refreshing, for we are not a little fatigued. So good night. Yours, truly, S. J. MAY.
—*Syracuse Standard*.

Be perfect, be of good comfort, be of one mind, live in peace; and the God of love and peace shall be with you.

From the Patent Office Report.

ON THE PRACTICABILITY OF THE TEA CULTURE
IN THE UNITED STATES.

That an article so generally regarded as a prime necessity by every civilized nation should be restricted in its production for centuries almost entirely to the country of its origin, although corresponding regions with respect to soil and climate have been open to its introduction and culture, is an anomaly in the physical and social history of the globe. The tea of China, though acknowledged by most persons as a luxury, and by some even as food, is a commodity from which the people of no country should be deprived. On the contrary, it may not be improper to repeat what was stated in a former volume, that in this case, as well as in most others, it is the policy of every government to gratify the wishes of its people, and to facilitate the acquisition of this luxury by its economical importation, or, what would be far more desirable, to extend the production to its own soil. As to the expediency in the United States of such a measure as that last named, little more need be said than that most of our citizens will have it, cost what it may, and millions of dollars will annually be paid for its importation, until its extensive culture shall be established in our soil.

From the supposed general resemblance of the soil and climate of the tea districts in China, and those of certain regions in our Southern States, various attempts have been made by private individuals to introduce this plant, which, in all cases, ultimately resulted unsuccessfully, either from accident or the want of an adequate knowledge of its culture, but more particularly of the manipulation of the leaves when grown. Thus, tea was introduced into Georgia in the year 1772, and more recently into South Carolina in 1848 and 1852.

IDENTIFICATION OF THE BLACK AND GREEN TEA PLANT.

In the edition of Mr. Fortune's "Wanderings in China," published in 1846, are some observations upon the plants from which tea is made in different parts of the Celestial Empire; while acknowledging that the Canton plant, known to botanists as *Thea bohea*, was distinct from the more northern one, called *Thea viridis*, he endeavored to show that both black and green teas could be produced from either, and that the dissimilarity of appearance, so far as color was concerned, depended only upon manipulation. In proof of this, he remarked that the black-tea plant, found by him near Foo-chow-foo, at no great distance from the Bohea hills, seemed identical with the green-tea plant of Chekiang. These observations were met by the objection that, although he had been in many of the tea districts near the coast, yet he had not seen the more extensive ones inland which furnish the teas of commerce. Since that time, Mr. Fortune

has visited both the green tea country of Hwye-chow and the black tea districts about Woo-shan; and, during these long journeys, he verified the opinions previously formed. It is quite true that the Chinese rarely make the two kinds of tea in the same district, but this is more for the sake of convenience and from custom than for any other reason. The workmen, too, generally made that kind of tea best with which they have had the most practice. Although this may generally be the case in the great tea districts, there are some exceptions. It is well known that the fine Moning districts, near the Poyang Lake, which are constantly rising in importance on account of the superior character of their black teas, formerly produced nothing but green teas. At Canton, green and black teas are made from the *Thea bohea* at the pleasure of the manufacturer, or according to the demand.

CULTIVATION AND MANAGEMENT OF THE TEA PLANTATIONS.

In the black-tea districts of China, as in the green, large quantities of young plants are yearly raised from seeds. These seeds are gathered at maturity, in October, mixed immediately after, and packed in sand and earth, in which they are kept during the winter months. In this manner, they are preserved fresh until spring, when they are thickly sown in some corner of the farm, whence they are afterwards transplanted. Sometimes, they are sown in rows, where they are destined to grow, and consequently do not require to be removed. When about a year old, the plants are usually from nine inches to a foot in height, and are ready for transplanting. They are set in rows about four feet apart, in bunches, or hills, three or four feet asunder along the rows, with five or six plants to each bunch. In some cases, however, when the soil is poor, as in many parts of Woo-e-shan, they are planted very close in the rows, and appear like hedges when fully grown.

The young plantations are always made in the spring, and are well watered by the rains which fall at the change of the monsoon in April and May. The damp, moist weather, at this season, enables the plants to establish themselves in their new quarters, where they afterwards require but little care, except in keeping the ground free from weeds.

When the winters are very severe the natives tie straw bands round the young tender shrubs to protect them from the cold, and to prevent them from cracking or bursting from frost or snow.

A tea plantation, when seen at a distance, looks like a little shrubby of evergreens. As the traveller threads his way among the rocky scenery of Woo-e-shan, these plantations, which are constantly seen dotting the hill sides, afford a pleasing contrast to the strange and often barren surface by their rich, dark-green leaves. When young, they are allowed to grow unmo-

lested for two or three years, or until they are well established and producing strong and vigorous shoots. The practice of plucking the leaves is very prejudicial to this shrub, and the natives always take care that the plant shall be in a vigorous and healthy condition before this operation is commenced. Even when the plantations are in full bearing, they never take many leaves from the weaker plants, in order that their growth may not be checked. For, under the best mode of treatment, and on the most congenial soil, they ultimately become stunted and unhealthy, and are never profitable when old. Hence, in well-managed tea-districts, the natives annually remove old plantations and supply their places with fresh ones.

The first crop of leaves is usually taken from the plants the third year. When under cultivation, they rarely attain a greater height than three or four feet. The length of time which a tea plantation will remain in full bearing depends, of course, upon a variety of circumstances, but with the most careful treatment consistent with profit, the plants will not be of much value after ten or twelve years of age; in fact, they often dry up, and the space must be replanted within that period.

MANIPULATION OF THE TEA LEAVES.

It is not the intention of the present paper to enter minutely into the subject of the manipulation of black and green teas. These methods, it may be stated, differ from one another in several particulars, which are quite sufficient to account for the difference of color. It would seem scarcely necessary to remark that both kinds of tea are gathered from the shrubs in the same way, and are made from the same description of leaves, namely, those which are young and recently formed.

Green Tea.—When the leaves intended to be made into green tea are brought in from the plantations, they are thinly spread out on flat bamboo trays, in order that the superfluous moisture may be evaporated. They remain only for a short time exposed in this manner, say, generally, from one to two hours. This, however, depends much upon the state of the weather. In the meantime, the roasting pans have been heated with a brisk wood fire. A portion of the leaves are then thrown into each pan, and rapidly moved about and shaken up with both hands. They are immediately affected by the heat, becoming quite flaccid and moist, and giving out a considerable vapor. In this state, they remain for four or five minutes, when they are quickly drawn out and placed on the rolling table.

Next commences the rolling process. Several men, stationed at the table, divide the leaves among them. Each takes as many as he can press with his hands, and makes them up in the form of a ball, which is rolled upon the rattan-worked table, and in this manner becomes great-

ly compressed, the object being to get rid of a portion of the sap, or moisture, and at the same time to twist the leaves. These balls are frequently shaken out and passed from hand to hand until they reach the head workman, who carefully examines them to see if they have acquired the requisite twist. When he is satisfied of this, the leaves are removed from the rolling table and shaken out upon flat trays, until the remaining balls have undergone the same process. In no case are they allowed to lie long in this condition, and sometimes they are removed at once to the roasting-pan.

Having been thrown again into the pan, a slow and steady charcoal fire is kept up, and the leaves are put into rapid motion by the hands of the operators. Sometimes they are thrown upon the rattan-table and rolled a second time. In from an hour to an hour and a half the leaves become well dried, and their color "fixed;" that is, there is no danger of their turning black. They are now of a dullish green, but afterwards become brighter. This process, it is to be understood, does not apply to teas which are artificially colored. As the most particular part of the operation is now finished, the tea is put aside until a larger quantity has been made.

The second part of the process consists of winnowing and passing the tea through sieves of different sizes, in order to get rid of the dust and other impurities, and to divide the tea into classes, known by the names of "twankay," "hyson skin," "hyson," "young hyson," "gunpowder," &c. During this operation, it is "refined," the coarse kinds once, and the finer sorts three or four times. At this stage the color has become more decided, and the leaves of the superior kinds are of a dull bluish green.

Thus it will be observed, with reference to green tea, that, *first*, the leaves are roasted almost immediately after they are gathered; *second*, that they are quickly dried off after the process of rolling.

Black Tea.—When the leaves designed to be manufactured into black tea are brought in from the plantation, they are spread upon large bamboo mats or trays, and are allowed to lie in this state for a considerable time. If brought in at night, they remain upon the trays until the next morning. They are next gathered up by the workmen with both hands and thrown into the air, in order to separate as they fall. In this manner, they are tossed about and slightly beaten or patted with the hands until they become flaccid and soft, when they are cast into heaps and allowed to remain in this condition for an hour, or, perhaps, a little longer. When examined, at the expiration of this period, they appear to have undergone a slight change in color, are soft and moist, and emit a fragrant smell.

The next part of the process is exactly the same as in the manipulation of green tea. The

leaves are thrown into an iron pan, when they are roasted for about five minutes, and rolled upon the rattan table.

After being rolled, the leaves are thinly shaken out on sieves, and exposed to the air out of doors. For this purpose, a frame-work made of bamboo is seen in front of cottages among the tea hills. In this condition, the leaves are allowed to remain for about three hours, while the workmen are employed in going over the sieves in rotation, turning the leaves and separating them from each other. A fine, dry day, when the sun is not too bright, seems to be preferred for this part of the operation.

The leaves having now lost a large portion of their moisture, and become considerably reduced in size, are removed into the factory, where they are again put into the roasting-pan for three or four minutes, and taken out and rolled as before. A charcoal fire is now got ready, over which is placed a tubular basket, narrow in the middle and wide at each end. A sieve is dropped into this tube, on which the leaves are shaken to a thickness of about an inch. After five or six minutes of careful watching, the leaves are removed from the fire and rolled a third time. As the balls come from the hands of the roller, they are placed in a heap, until the whole batch has been rolled. They are again shaken on the sieves, and set over the fire a little while longer. Sometimes the last named operation, namely, heating and rolling, is repeated a fourth time, or until the leaves have assumed a dark color. When the whole batch has been gone over in this manner, it is thickly placed in the baskets, which are once more set over the charcoal fire. The operator now makes a hole with his hand through the centre of the leaves, in order to allow vent to any smoke or vapor which may rise from the charcoal, as well as to admit the heat, and then covers the whole with a flat basket. Previous to this, the heat has been greatly reduced by covering up the fire. The tea now remains over this slow fire until it is quite dry, being carefully watched, however, by the manufacturer, who every now and then stirs it up with his hands so that the whole mass may be equally exposed to the heat. The black color is now fairly produced, but afterwards improves. The after processes, such as sifting, picking, and "refiring," are carried on at the convenience of the workman.

Thus it will be seen, with reference to the leaves which are to be converted into black tea, *First*, that they are allowed to lie for some time spread out in the factory, and before they are roasted. *Second*, that they are tossed about until they become flaccid and soft, and then left in heaps, and that this also is done before they are roasted. *Third*, that after being roasted for a few minutes and rolled, they are exposed in a soft and moist state for several hours to the air.

Fourth, that they are at last dried slowly over charcoal fires.

The differences in the manufacture of black and green teas are therefore most marked, which will fully account for the variations in color, as well as for the effect produced on some constitutions by green tea.

(To be continued.)

UNNOTICED HEROES.

BY T. HEMPSTEAD.

Woods have their blossoms which we ne'er behold,
And skies their worlds whose light is never
shown,

Ocean its treasures of unnoted gold,
And earth her heroes that are all unknown.

You meet them as they pass, and heed them not,
You may not know what hosts before them fell;
You may not count the battles they have fought,—
The wreaths that crown them are invisible.

Yet they have fought and conquered; they have bent,
Night after night beside the couch of pain,
They have confronted scorn and death, and lent
Their blood to make the stricken whole again.

They have been pilgrims to that desert shrine,
Which sorrow rears in the black realm, Despair;
Oft have they struggled in that gloomy mine
Where only dust is made the toiler's share.

They have beheld their sweetest hopes decay,
Oft have they seen their brightest dreams depart;
Have seen their golden idols turned to clay,
And many bear within a broken heart.

Their veiled and mighty scars they ever bear,—
Those scars that lie deep burned into the soul
Won where the flaming eyes of vengeance glare,
And the tumultuous fires of passion roll.

They have been victors! they have conquered fields
Earth's dreaded Hannibals could never win,
They have struck down the sword ambition wields,
And trampled Lust and chained the hands of Sin.

They have won captives! their sweet tones have
brought
The erring back to virtue's flowery path;
Their own and other's hearts submissive taught
To God's high will, and smoothed the brow of
wrath.

They drink the dregs of trembling; but their moans
And anguished wails they stifle in their breast;
They say there is an ear that hears their groans,
And in his house the weary will find rest.

Want, grief, the scorn of man, on them descend,
They only say, it is His righteous will;
With chastened spirits to that will they bend,
Believing, striving, hoping, loving still.

O! there are daily martyrdoms that we
Heed not, the sufferers are to us unknown,
But angels from the walls of Eden see
How glorious are the laurels they have sown.

THOUGHTS WHILE SHE ROCKS THE CRADLE.

BY DR. J. G. HOLLAND.

What is the little one thinking about?
Very wonderful things no doubt,
Unwritten history! unfathomable mystery;
But he laughs and cries, and eats and drinks,
And chuckles and crows, and nods and winks,

As if his head were as full of kinks,
And curious riddles, as any sphinx!

Warped by colic and wet by tears,
Punctured by pins, and tortured by fears,
Our little nephew will lose two years;
And he'll never know
Where the summers go
He need not laugh, for he'll find it so!

Who can tell what the baby thinks?
Who can follow the gossamer links
By which the manikin feels his way
Out from the shores of the great unknown,
Blind, and wailing, and all alone,
Into the light of day?

Out from the shores of the unknown sea,
Tossing in pitiful agony!
Of the unknown sea that reels and rolls,
Specked with the barks of the little souls—
Barks that were launched on the other side,
And slipped from heaven on an ebbing tide!

And what does he think of his mother's eyes?
What does he think of his mother's hair?
What of the cradle roof that flies
Forward and backward through the air?
What does he think of his mother's breast—
Bare and beautiful, smooth and white,
Seeking it ever with fresh delight—
Cup of his joy and couch of his rest?

What does he think when her quick embrace
Presses his hand and buries his face
Deep where the heart-throbs sink and swell
With a tenderness she can never tell,
Though she murmur the words
Of all the birds—
Words she has learned to murmur well?

Now he thinks he'll go to sleep!
I can see the shadows creep
Over his eyes, in soft eclipse,
Over his brow, and over his lips,
Out to his little finger tips.
Softly sinking, down he goes!
Down he goes! down he goes!
See! he is hushed in sweet repose!

From the Atlantic Monthly.

UGHT WOMEN TO LEARN THE ALPHABET?

(Concluded from page 91.)

There are duties devolving on every human being,—duties not small or few, but vast and varied,—which spring from home and private life, and all their sweet relations. The support or care of the humblest household is a function worthy of men, women, and angels, so far as it goes. From these duties none must shrink, neither man nor woman; the loftiest genius cannot ignore them; the sublimest charity must begin with them. They are their own exceeding great reward, their self-sacrifice is infinite joy, and the selfishness which discards them receives in return loneliness and a desolate old age. Yet these, though the most tender and intimate portion of human life, do not form its whole. It is given to noble souls to crave other interests also, added spheres, not necessarily alien from these,—larger knowledge, larger action also,—

duties, responsibilities, anxieties, dangers, all the aliment that history has given to its heroes. Not home less, but humanity more. When the high-born English lady in the Crimean hospital, ordered to a post of almost certain death, only raised her hands to heaven and said, "Thank God!" she did not renounce her true position as woman, she claimed it. When the queen of James I. of Scotland, already immortalized by him in stately verse, won a higher immortality by welcoming to her fair bosom the daggers aimed at his,—when the Countess of Buchan hung confined in her iron cage, outside Berwick Castle, in penalty for crowning Robert the Bruce,—these things were as they should be. Man must not monopolize these privileges of peril, birthright of great souls. Serenades and compliments must not replace the nobler hospitality which shares with woman the opportunity of martyrdom. Great administrative duties also, cares of state, for which one should be born gray-headed, how nobly do these sit upon a female brow! Each year adds to the storied renown of Elizabeth of England, greatest sovereign of the greatest of historic nations. Christina of Sweden, alone among the crowned heads of Europe, (so says Voltaire,) sustained the dignity of the throne against Richelieu and Mazarin. And they most assuredly did not sacrifice their womanhood in the process; for her Britannic Majesty's wardrobe included four thousand gowns,—and Mlle. de Montpensier declares, that, when Christina had put on a wig of the latest fashion, "she really looked extremely pretty." Should this evidence of feminine attributes appear to some sterner intellects frivolous and insufficient, it is, nevertheless, adapted to the level of the style of argument it answers.

Les races se féminisent, said Buffon,—“The world is growing more feminine.” It is a compliment, whether the naturalist intended it or not. Time has brought peace; peace, invention; and the poorest woman of to-day is born to an inheritance such as her ancestors never dreamed of. Previous attempts to confer on woman social and political equality,—as when Leopold, Grand Duke of Tuscany, made them magistrates, or when the Hungarian revolutionists made them voters, or when our own New Jersey tried the same experiment, in a guarded fashion, in early times, and then revoked the privilege, because (as in the ancient fable) the women voted the wrong way,—these things were premature, and valuable only as concessions to a supposed principle. But in view of the rapid changes now going on, he is a rash man who asserts the “Woman Question” to be anything but a mere question of time. The fulcrum has been already given, in the alphabet, and we must simply watch and see whether the earth does not move.

In this present treatment of the subject, we have been more anxious to assert broad principles than to work them out into the details of their

application. We only point out the plain fact: woman must be either a subject or an equal; there is no other permanent ground. Every concession to a supposed principle only involves the necessity of the next concession for which that principle calls. Once yield the alphabet, and we abandon the whole long theory of subjection and coverture; the past is set aside, and we have nothing but abstractions to fall back upon. Reasoning abstractly, it must be admitted that the argument has been, thus far, entirely on the women's side, inasmuch as no man has yet seriously tried to meet them with argument. It is an alarming feature of this discussion, that it has reversed, very generally, the traditional position of the sexes: the women have had all the logic; and the most intelligent men, when they have attempted the other side, have limited themselves to satire and gossip. What rational woman, we ask, can be convinced by the nonsense which is talked in ordinary society around her,—as, that it is right to admit girls to common schools, and equally right to exclude them from colleges,—that it is proper for a woman to sing in public, but indelicate for her to speak in public,—that a post-office box is an unexceptionable place to drop a bit of paper into, but a ballot-box terribly dangerous? No cause in the world can keep above water, sustained by such contradictions as these, too feeble and slight to be dignified by the name of fallacies. Some persons profess to think it impossible to reason with a woman, and they certainly show no disposition to try the experiment.

But we must remember that all our American institutions are based on consistency, or on nothing; all claim to be founded on the principles of natural right, and when they quit those, they are lost. In all European monarchies, it is the theory, that the mass of the people are children, to be governed, not mature beings, to govern themselves. This is clearly stated, and consistently applied. In the free States of this Union, we have formally abandoned this theory for one half of the human race, while for the other half it still flourishes in full force. The moment the claims of woman are broached, the democrat becomes a monarchist. What Americans commonly criticize in English statesmen, namely, that they habitually evade all arguments based on natural right, and defend every legal wrong on the ground that it works well in practice, is the precise characteristic of our habitual view of woman. The perplexity must be resolved somehow. We seldom meet a legislator who pretends to deny that strict adherence to our own principles would place both sexes in precisely equal positions before law and constitution, as well as in school and society. But each has his special quibble to apply, showing that in this case we must abandon all the general maxims to which we have pledged ourselves, and hold only

by precedent. Nay, he construes even precedent with the most ingenious rigor; since the exclusion of women from all direct contact with affairs can be made far more perfect in a republic than is possible in any monarchy, where even sex is merged in rank, and the female patrician may have far more power than the male plebeian. But, as matters now stand among us, there is no aristocracy but of sex: all men are born patrician, all women are legally plebeian; all men are equal in having political power, and all women in having none. This is a paradox so evident, and such an anomaly in human progress, that it cannot last forever, without new discoveries in logic, or else a deliberate return to M. Marechal's theory concerning the alphabet.

Meanwhile, as the newspapers say, we anxiously await further developments. According to present appearances, the final adjustment lies mainly in the hands of women themselves. Men can hardly be expected to concede either rights or privileges more rapidly than they are claimed, or to be truer to women than women are to each other. True, the worst effect of a condition of inferiority is the weakness it leaves behind it; even when we say, "Hands off!" the sufferer does not rise. In such a case, there is but one counsel worth giving. More depends on determination than even on ability. Will, not talent, governs the world. From what pathway of eminence were women more traditionally excluded than from the art of sculpture, in spite of *Non me Praxiteles fecit, sed Anna Damer*?—yet Harriet Hosmer, in eight years, has trod its full ascent. Who believed that a poetess could ever be more than an Annot Lyle of the harp, to soothe with sweet melodies the leisure of her lord, until in Elizabeth Barrett's hands the thing became a trumpet? Where are gone the sneers with which army surgeons and parliamentary orators opposed Mr. Sidney Herbert's first proposition to send Florence Nightingale to the Crimea? In how many towns has the current of popular prejudice against female orators been reversed by one winning speech from Lucy Stone! Where no logic can prevail, success silences. First give woman, if you dare, the alphabet, then summon her to her career; and though men, ignorant and prejudiced, may oppose its beginnings, there is no danger but they will at last fling around her conquering footsteps more lavish praises than ever greeted the opera's idol,—more perfumed flowers than ever wooed, with intoxicating fragrance, the fairest butterfly of the ball-room.

INFLUENCE OF OUT DOOR AIR AND SUNSHINE ON LONGEVITY.

A writer in one of the medical magazines argues that the more out-door air and cheery sunshine a man can use, the longer he will live. Go along any of the fashionable streets of New-York, says the writer, and you will find not less than

three, and often six, distinct contrivances to keep out sunshine and gladness. First, the Venetian shutter on the outside; second, the close shutter on the inside; third, the blind which is moved by rollers; then there are the lace curtains, the damask or other material, &c. In the train comes the exclusion of external air by means of double sash, and a variety of patent contrivances to keep any little stray whiff of air from entering from the bottom, sides and tops of doors and windows. At this rate, we shall dwindle into Lilliputs, if we do not die off sooner.

ON THE MANAGEMENT OF FLOWERS.

Carnations, and how to Produce Choice Sorts.—The best soil for carnations is good loam, enriched with well-decayed stable manure, and quickened with a little sand. The quantity of manure can only be determined by the previous strength of the ground; if made too rich the flowers will lose their fine colors, while if left too poor, they will want vigor. No recent manure should ever come near a fine plant. In the spring give a fresh digging, and plant in rows three feet by two; this width will make room for layers, without which a fine blow of carnations cannot be maintained above one year. As the plants shoot up they should be tied to neat green rods; and in order to have a fine blow, superfluous flower buds must be pinched off, leaving about three or four to each stem. From the young shoots near the ground, which do not run to flower, the layers are to be selected. The operation is somewhat nice, but, when rightly done, is always successful, and good flowers are thus preserved and multiplied from year to year. Toward the end of July stir up the ground about the flowers, and mix with the sod a little well-worked compost. Have at hand a sharp pen-knife, a trowel, and a number of small pegs, with an angle at each head. Scoop out the earth in the form of a basin around each plant, select the strongest shoots for layers, and remove such as are in the way. Then crop the top leaves an inch from the heart, and pinch off all the rest, taking care not to peel the stem. Begin an incision on the under side of the shoot, a little below the second joint from the top, and cut upward till the joint is slit in the middle. Set the pointed extremity made by the slit into the bottom of the excavation, and there fix it with the peg; place the head of the shoot erect, fill in the earth, make it firm, and finish the work with a good watering. The young plants will be ready for removal by the end of autumn, when they may be set in flower pots for the winter. Carnations always require room to expand and blow, and, when fully grown, the stalks should be tied with a strip of bust to a small stake, thrust in the soil at their side.

Bulbous Plants.—Hyacinths.—The bulbous

plants include the hyacinth, narcissus, iris, lily, tulip, snowdrop, crocus, and others. The hyacinth has a tapering bulb, shoots up long green leaves, and in the centre is a stalk on which the bloom, in the form of bells, grows all round, causing it to droop or bend. There are several varieties, differing in color—as blue, red, and white, but the blue is the most common. The hyacinth is a favorite with the Dutch, by whom it has, like the tulip, been brought to great perfection. The best kinds have double flowers with brilliant colors. A sandy soil and saline atmosphere, with a warm exposure, are favorable in developing the best properties of these flowers. The most experienced cultivators carefully lift and store the bulbs during winter, though this is not absolutely essential.

The Narcissus.—Of the narcissus there are many varieties, which include daffodils, white narcissus, jonquils, and polyanthus narcissi, the chief difference being in the size and color of the petals. Most have a lightish yellow-colored flower, with a deeper yellow cup. A fine narcissus has tall and firm leaves, and from the centre springs the round tube-like stalk, on the top of which is the bright yellow bloom, with petals spreading out like rays from a star. Some send up two flower stalks, and the criterion of excellence is massiveness and distinctness of color in the corolla. Of the polyanthus species there are a multitude of sorts, sulphur-colored, single and double, white, &c. Like hyacinths, the bulbs may remain in the ground during winter.

STATISTICS OF INSANITY.

The Annual Report of our State Lunatic Hospital brings some very useful facts to the notice of the public. It is a lamentable proof of the imperfect ideas we all have of civilization and proper mental cultivation, that in proportion as education and civilization are supposed to be progressing among us insanity is also on the increase. A large proportion of this increase arises from perverted views of education and of life from a one-sided development and cultivation of our natures.

This report shows that an ounce of prevention is worth a pound of cure. "The great tendency of the period is to over exertion and stimulation, the haste to be accounted learned, as well as the haste to be rich. Children are sent to school too young, and if they manifest any evidence of smartness, they are encouraged and urged forward to a degree their powers are unable to bear. Under ten very little mental effort should be required of children, and they should be allowed a large amount of bodily exercise, health and strength being more desirable than any learning which at that age they are supposed capable of acquiring." These are the maxims which ex-

perience and the highest medical wisdom dictate as the best of all preventatives of insanity.

There is another fact worth noticing; it is the degree to which insanity is curable. Out of two hundred and sixty-seven patients, thirty-six were restored, thirty more were improved, and fourteen died. This seems less favorable than in former years. Out of the whole number admitted, 1049, 174 have been restored to reason, or about one in six, and a still larger number improved. Everything depends on *timely* treatment. Within the first three months, proper medical treatment can do more than at any other time, and after the first year neglect becomes almost irreparable.

ITEMS OF NEWS.

SEVENTY DOLLARS, invested by several hundred young men during the past fall and winter, for tuition, books, board, all expenses in full, at the Iron City College, Pittsburgh, Pa., has secured, for a great majority of them employment this spring, at rates varying from \$40 to \$80 per month.

GIGANTIC CLAMS.—At a recent meeting of the Boston Natural History Society, Dr. C. F. Winslow presented the animal of a gigantic clam from Puget Sound, which is said to project its tube from eighteen to twenty-four inches. It is eaten by the Indians. He has also specimens of the shells measuring five by four inches.

DEAD LETTERS.—During the quarter which closed on the 31st ult., the openers of dead letters in the General Post Office found 2186, which contained an aggregate of \$10,292.

The patent office fees last week exceeded \$2,500. The inventive genius of the country is taking a fresh start.

MONEY ORDERS.—In this useful branch of the postal system, the province of Canada is far ahead of the United States: they have it and we do not. An arrangement has just been made, to take effect 6 mo. 1st., by which the money-order system of Canada and Great Britain will be combined, so that money-orders from the latter country will be redeemed at any post office in the province, and vice versa.

Jonathan Pancoast, who worked on the first public building erected at Washington, died lately in that city, aged 91. He was a native of Burlington, N. J.

SLAVERY.—The Annual Conference of the Methodist Church in session at New Haven, on the 19th inst., passed almost unanimously a resolution declaring that slaveholding is a sin, and should be inserted in the general rules as one of the things forbidden by them.

EMPLOYMENT FOR WOMEN.—It is proposed to establish a school on Long Island, about forty miles from New York city, for the purpose of teaching horticulture to orphan girls. The land has already been given, and the foundation of the necessary building laid. As much of the labor necessary to grow all the finer fruits and vegetables can be performed by females, a new avenue for the employment of women can thus be opened.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is inactive, and prices are unchanged. We quote sales of superfine Flour at \$6 50 a 6 12 and \$6 50 a 6 62 for extra family. The sales to the retailers and bakers are within the range of the same figures. Sales of Rye Flour and Corn Meal continue limited. The

former at \$4 12 per bbl. Corn Meal is held at \$3 87, for Pennsylvanian.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 56 a 1 58 per bushel for fair and prime red, and \$1 60 a 1 65 for white in store. Rye is in demand, and sells at 88 a 89 cts. Corn is in demand; sales of yellow at 88 a 89 cents, afloat. Oats continue dull; sales of prime Pennsylvania at 51 a 53 cents, and of Southern at 51 cents.

CLOVER SEED.—Sales at \$5 00 a 5 25 per 64 lbs. for fair and good quality, and \$5 50 a 6 00 from second hands. No further sales of Timothy or Flax seed.

HIGHLAND DALE.—Charles and Catharine Foulke inform their friends that their house will be open for the reception of boarders, early in the 6th month. It is an elevated situation, one mile from Stroudsburg, and four miles from the Delaware Water Gap.

The cars leave Walnut Street wharf every morning for Stroudsburg.

The price of board in 6th and 7th months, will be \$6 per week, and in the 8th month, \$7 per week. Children under 12 years, half price.

4th month, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next session of this Institution, on the 2d of 5th mo. next. For reference and further particulars, enquire for circulars of Principal,

BENJAMIN SWAYNE.

London Grove, 22d of 3d mo., 1859.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON,

MAGGIE B. JACKSON,

} Assistants.

Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER,

SUSANNA G. CHANDLER,

} Proprietors.

3d mo. 19, 1859.—10 t.

ELDRIDGE'S HILL BOARDING SCHOOL FOR THE EDUCATION OF YOUTH OF BOTH SEXES.—All the branches of a liberal English Education are thoroughly taught in this Institution. Also the French and Latin languages.

The summer session will open on the 3d of 5th mo., 1859, and continue 20 weeks, terms \$70 per session.

For full particulars address the Principal for a circular.

ALLEN FLITCRAFT,

Eldridge's Hill, Salem County N. J.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIFTH MONTH 7, 1859.

No. 8.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

On Repentance and Conversion.

James. I believe most professors of Christianity expect to act upon peaceable principles, as soon as the state of the world will bear it. When the millennium shall come, then will "their swords be beaten into ploughshares, and their spears into pruning hooks; for nation shall not lift up sword against nation, neither shall they learn war any more."

John. Yes; I suppose it will be very easy to refrain from fighting, when there shall be no provocation offered to us; but how is such a state of things to be brought about?

Father. The way is clearly pointed out,—it must be by the power of God, manifested in the meek example and patient sufferings of the faithful. This was the way that Christianity was first propagated; and its wonderful progress, during the days of the apostles and primitive martyrs, attests the wisdom and power of its divine Author. The Apostle Peter, of whom we have been speaking, after that the Holy Spirit with power from on high had come upon him and renewed his heart, could then follow the meek example and holy precepts of Christ; and by preaching with boldness, and suffering with patience, even unto death, he bore testimony to the truth of the Gospel, and proved that his heart was then converted by the purifying influence of the spirit of Christ. In those primitive times, the law of love governed the lives of the followers of Christ, and influenced all their conduct, not only towards one another, but towards all mankind: they did not fight against

their enemies, but prayed for them. And whenever primitive Christianity shall prevail in the world, it must bear the same fruits of meekness and love; for the tree will always be known by its fruits—"men do not gather grapes of thorns, nor figs of thistles."

John. It appears to me that if all who profess to be followers of Christ would only walk in his footsteps, the world would soon wear a different aspect from what it now does.

James. I do not profess to be a religious man, but I can plainly see the great disparity there is between the profession and the practice of those who are called the followers of Christ; and I have at times been almost ready to conclude, that there is no genuine religion among them.

Father. There is no doubt that the cause of Truth has sustained more injury from the inconsistency of its professors, than from all the efforts of deists and infidels. But we must not charge upon Christianity the faults of those who merely profess the name, without becoming obedient to the spirit of Christ; for in these is fulfilled the prophecy of Isaiah, "In that day shall seven women take hold of one man, saying, we will eat our own bread and wear our own apparel: only let us be called by thy name, to take away our reproach." They do not depend upon Christ to give them the living bread which comes down from heaven, and gives life to the soul;—nor do they wait for the water of life, which springs up in the obedient, dedicated mind;—neither do they wear the seamless garment of simplicity and truth: but they are willing to be called by his excellent name, while in their hearts they are "crucifying to themselves the Son of God afresh, and putting him to an open shame."

John. Would not a continual obedience to the teachings of Divine grace in our hearts, lead us into conformity with the example of Christ?

Father. Certainly it would: for that grace is a manifestation of the same spirit that was in Christ (John i. 4-16); and if we were obedient to it, we should be led out of all evil, and from under the bondage of corruption, into the glorious liberty of the sons of God.

James. But if this spirit is so very powerful, why is it that so few persons understand and obey it?

Father. Because, in its first appearance, the seed of the kingdom is so small that it is overlooked or trodden down. It is likened to a

"grain of mustard seed, which is the smallest of all seeds, but when it is grown it is the greatest of herbs, so that the fowls of the air lodge in its branches." Those who are looking for great things, and extraordinary illuminations, will not put their faith in this little seed which is sown in every heart; and yet, "in it are hidden all the treasures of wisdom and knowledge;" for it is that "grace of God which bringeth salvation, and hath appeared to all men, teaching us that, denying ungodliness and worldly lusts, we should live soberly, righteously, and godly in this present world." Titus ii. 11, 12.

The first appearance of this Divine grace, or monitor, in the hearts of transgressors, is in the character of a reprovcr for sin;—and if we will be obedient to it, by repenting and turning away from our sins, it then becomes known to us as a comforter in righteousness: and if we still continue to follow it for our guide, it will become to us a "spirit of judgment, and a spirit of burning, and will purely purge away our dross, and take away our tin: for Zion shall be redeemed with judgment, and her converts with righteousness." Isaiah iv. 4, and i. 25, 27.

If any man think to be saved by a profession of religion, or an implicit belief in the doctrines of Christianity, without experiencing a regeneration and bringing forth the fruits of the spirit of Christ, he is deceiving himself, and building "his house upon the sand." It was against such professors that the wo was denounced by the prophet,—“Wo unto him that buildeth his house by unrighteousness, and his chambers by wrong, that useth his neighbor's service without wages, and giveth him not for his work.” Jer. xxii. 13.

John. But does not this strike at the root of involuntary slavery, which many professors are concerned in; for that appears to me to be "using our neighbor's service without wages?"

Father. Certainly it does: for the Jews were taught by Jesus, in the parable of the good Samaritan, to regard all men as their neighbors,—even the Samaritans with whom they had long been at enmity. But there are some of his precepts which are still more pointed against slavery. One of them is, "Thou shalt love thy neighbor as thyself." And another is, "Do unto others as thou wouldst that they should do unto thee." He who follows these precepts cannot possibly compel his fellow-creatures to work for him against their consent, nor without giving them full compensation for their labor.

John. But I have heard professors who were slave-holders say, that the Jews under the old law were allowed to hold slaves.

Father. Yes; but Paul says "the law made nothing perfect, but the bringing in of a better hope did, by which we draw nigh unto God." Heb. vii. 19. The law of Moses was not from the beginning, but "was added because of trans-

gression, till the seed should come to whom the promise was made." Gal. iii. 19. The Israelites were then in such a dark, carnal state, that they could not receive a more spiritual law; and the professors of Christianity, whose minds are now in the same dark state, find it very convenient to go back to those who lived under the law, for examples to follow, instead of following after Christ. By this means they might justify not only war and slavery, but polygamy and other gross evils. Moses allowed a man who was not satisfied with his wife to give her a writing of divorcement, and put her away; but Christ says, it was "not so from the beginning," and that it was allowed by Moses, "because of the hardness of their hearts."

John. But does not the New Testament speak of servants?

John. Yes: it speaks of those whose calling or business in life was that of servants; and Paul advises such to be content in their calling: saying, "Let every man remain in the calling wherein he was called. Art thou called being a servant? care not for it." 1 Cor. vii. 20. But we are not to suppose that these were slaves, for a man may agree to serve another for wages, and then he is called a servant.

John. It appears to me that a great many good men, in all ages of the world, have been concerned in the practice of going to war, and holding slaves.

Father. A great many persons who were sincerely pious, have been partakers of these evils, their eyes being so blinded by the prejudices of education that they did not see them in their true light. We find, however, that such persons have always mourned over the calamities of war, and endeavored to mitigate the hardships of slavery; and if they had followed still further the teachings of this benevolent spirit, they would have been led by it entirely out of these evils; for, like the dawning of light upon the natural world, the perception of Divine Truth in the minds of individuals and nations is always gradual and progressive. But it appears from the history of the Christian church, that the practice of war, even in self-defence, was condemned by the primitive Christians for the first three centuries: and after the visible church became corrupted, and had apostatized from the Truth, there were large numbers, in almost every age, who bore a faithful testimony against the shedding of human blood,—against oaths of every kind,—against priestcraft and persecution,—and against many of the corruptions in faith and practice which had crept into the church.

There were great numbers of these dissenters in Italy, from the ninth to the thirteenth century, who bore the name of Paterines; and a similar people were known in Piedmont by the name of Waldenses, who continued for five or six centu-

ries, till about the time of the Reformation.* The Moravian brethren professed nearly the same principles, both before and since the Reformation, and the Society of Friends have borne the same testimonies for nearly two hundred years past. All these people suffered severely from persecution, and immense numbers sealed their testimonies with their blood in martyrdom, rather than take up the sword in self-defence; but they were sometimes wonderfully preserved, and seldom suffered from any others than the false professors of Christianity. Even the Indians of North America respected the Friends and Moravians, although in the first settlement of Pennsylvania they were entirely unprotected by arms, and professed the principle of non-resistance.

These holy and benevolent principles must prevail more generally among professing Christians, before that happy era can arrive when the lion and the lamb shall lie down together, when the outcasts of Israel shall be gathered, and Ethiopia shall stretch forth her hands unto God.

Every one who professes to be a follower of Christ, in this enlightened age, should reflect deeply upon these things, and endeavor to walk in the narrow path of self-denial; for we shall not be judged by the measure of knowledge that was imparted to other men of former ages, but according to what has been made known to ourselves. "Unto whomsoever much is given, of him shall be much required: and to whom men have committed much, of him they will ask the more." Luke xii. 48. If the holy men who are mentioned in the Old Testament lived up to the law that was given to them, we ought likewise to live up to the law that is given to us, which is not an outward law that can take cognizance of outward acts only, but is an inward law that takes hold of the motives and principles of action, being written by "the Spirit of the living God, not in tables of stone, but in the fleshly tables of the heart." Jer. xxxi. 33, and Cor. iii. 3. It is this "law of the spirit of life in Christ Jesus which makes free from the law of sin and death." See Rom. viii. 2. For it will (in those who are obedient to it) "crucify the flesh with its affections and lusts."

When the "love of God is shed abroad in the heart" and becomes our governing principle, it makes us love all God's creation, and especially all mankind; "for he made of one blood all nations of men, for to dwell on all the face of the earth."

If God is "good even to the unthankful and to the evil," will not his Holy Spirit prompt us to pursue the same course? And if his beloved Son laid down his life for the good of

mankind, and prayed for his persecutors, will not his dominion in our hearts be attested by the same kind of fruits?

These truths are undeniable;—and I think it is equally clear, that the man who comes fully under the government of Divine Love, will not only bear a faithful testimony against all contention, oppression and injustice, but against every thing that is opposed to the peace and happiness of man. He cannot enrich himself by dealing in that which makes other men poor; neither can he become an instrument of evil by encouraging in any way the frequent or unnecessary use of ardent spirits, when he sees how many thousands in our country are falling a prey to intemperance, and how many tens of thousands it has reduced to misery and ruin.

John. I should think the effect of true religion must be, not only to restrain us from evil, but to lead us into all goodness.

Father. Certainly it is. We must not only "cease to do evil," but we must "learn to do well," and thus obtain the fulfilment of that blessed promise: "Though your sins be as scarlet, they shall be as white as snow, and though they be red like crimson, they shall be as wool." Isa. i. 16–18.

Our holy and blessed example, Christ Jesus, went about continually doing good;—it was his meat and his drink to do his Father's will; and all those who would be his disciples must follow his steps, as far as light and ability are afforded.

"Is not this the fast which I have chosen," saith the Lord, "to loose the bands of wickedness, to undo the heavy burdens, and to let the oppressed go free, and that ye break every yoke? Is it not, to deal thy bread to the hungry, and that thou bring the poor that are cast out to thy house? When thou seest the naked that thou cover him, and that thou hide not thyself from thy own flesh." Isaiah lviii. 6, 7.

He who does these things from the pure motive of Christian charity, will not sound a trumpet before him, but will endeavor to "do them in secret, and he who seeth in secret will reward him openly." It is true, the Divine Being looks at the state of our hearts, and the motives of our actions, rather than the actions themselves;—but pure motives and good feelings cannot long exist in us, without bringing forth their appropriate fruits;—therefore the apostle James says, that "faith without works is dead," and that "pure religion and undefiled before God and the Father is this: to visit the fatherless and widows in their affliction, and to keep ourselves unspotted from the world." Now in order to keep ourselves unspotted from the world, we must not only forsake its vices, but we must turn away from its vain fashions and trifling amusements. We must not "be conformed to this world, but transformed by the renewing of our minds." Rom. xii. 2. And we are required

* For a full account of these people, see Jones's Church History. Some notice of them may be found in Mosheim's Ecc. History.

"to walk in wisdom towards them that are without, redeeming the time; and let your speech be always with grace, seasoned with salt, that ye may know how ye ought to answer every man." Colos. iv. 5, 6.

These are the genuine and invariable fruits of being "born again of incorruptible seed, by the word of God which liveth and abideth forever;" and it is not possible for any soul to participate in the joys of heaven, either here or hereafter, without being born again, and made a "partaker of the Divine nature."

The gospel of Christ (by which I mean the "power of God unto salvation," Rom. i. 16,) is truly a glorious gospel; for it saves men from the dreadful effects of sin, not by an imputative righteousness, but by taking away the sinful nature out of the heart, so that those who have been dead in sin are raised up in newness of life. We cannot be reconciled to God while we remain in a state of sin; for "what communion hath light with darkness, and what concord hath Christ with Belial?" That corrupt nature in man which has sinned, must be crucified and slain, (Rom. vi. 6,) in order that Christ may reign in us; for "if any man be in Christ he is a new creature, all old things are done away, and all things are new, and all things of God." We must "put off the old man with his deeds, and put on the new man, which is renewed in knowledge after the image of him that created him, where there is neither Greek nor Jew, circumcision nor uncircumcision, Barbarian nor Scythian, bond nor free; but Christ is all, and in all." The true Christian knows no distinction of party or sect, of rank or condition; for he loves all mankind;—and all those who are governed by the same pure spirit, whatever may be their name or profession of religion, he can salute as brethren. He does not expect the fellowship of the gospel to be always accompanied by an entire uniformity of opinion, for it is "the unity of the spirit" that is "the bond of peace;" and if all the professors of religion were governed by that one pure spirit which speaks "peace on earth and good will to men," there would be no occasion for creeds to define the boundaries that separate one sect from another. It has always been the effect of human creeds and systems of religion, to array sect against sect, and brother against brother; but our Divine Master has given us no creed to bind the consciences of men, except the one rule by which their principles may be known, which is to try them by their fruits; for a good tree cannot bring forth evil fruit, nor an evil tree good fruit.

"Love is the fulfilling of the law," and "by this shall all men know that ye are my disciples, if ye have love one to another." Not every one that saith unto me, Lord, Lord, shall be saved, but he that doeth the will of my Father which is in heaven."

Let no man think himself converted, or regenerated, until he finds the pure spirit of Divine Love to be his governing principle in thought, word, and deed, so that "whether he eats, or whether he drinks, or whatsoever he does, it is all for the glory of God." Then, and not till then, can it be truly said that he is renewed in the spirit of his mind, and that he has "put on the new man, which after God is created in righteousness and true holiness." Ephesians iv. 24. We are assured that those who arrive at this blessed state will find "the yoke made easy and the burden light," for there will be a spring of joy opened in their hearts, that will make every trial and affliction seem as nothing, for Christ's sake. The pleasures and honors of the world will, in their view, lose all their charms to please, and they will go on their way rejoicing in a living foretaste of those celestial joys which the world can neither give nor take away. But even in this state of mind, there is a continual need of reliance upon Divine aid, for "it is not in man that walketh to direct his steps." Jer. x. 23. And that solemn injunction of Christ should never be forgotten,—"Watch ye, therefore, for ye know not when the master of the house cometh, at even, or at midnight, or at the cock-crowing, or in the morning; lest coming suddenly, he finds you sleeping. And what I say unto you, I say unto all, Watch."—Mark xiii. 35.

(To be continued.)

New York, 4th mo. 19th, 1850.

Wm. W. Moore.—Dear Friend,—Finding the enclosed memorial of a much beloved friend among my papers, and thinking good service might result from a republication of it in the *Intelligencer*, I send it, at thy disposal.

Thy friend,

DOBEL BAKER.

A Memorial from the Monthly Meeting of Friends of Philadelphia, held at Cherry Street, concerning our dear deceased friend Rachel Rowland.

Under a feeling sense that the memory of the just is blessed, and believing that the pious and bright example of our departed friend, by being held up to the view of survivors, and especially to our beloved youth, may tend to raise in their minds a desire to follow her as she endeavored to follow Christ, we are engaged to give forth this Memorial of one whom we esteemed as a mother in Israel.

She was the daughter of John and Rachel Edwards, of this city, and was born on the 2d day of the Seventh month, 1766. Her father was a member of the Episcopal communion, and both her parents died when she was a child.

About the ninth year of her age, she was placed with a valuable Friend, and during her

residence in the family, she became convinced of the principles of truth as professed by us, and was received a member of our religious Society.

In the twentieth year of her age she was married to Isaac Buckbee, with whom she was united, until the awful visitation of yellow fever in the year 1793, which clothed the city of Philadelphia as in sackcloth and ashes, from the desolating effects of the pestilence, which walked in darkness and wasted as at noonday.

Her husband was removed by the epidemic, and in the same season her beloved friend, who had watched over her as with maternal care, was also taken away; and during her widowhood three of her children died.

Previously to this period, she had opened her mouth in the ministry in our public meetings, and as she was favored to abide in resignation, under her heavy trials, her religious experience deepened, and she became increasingly qualified to engage in the work whereunto she was called, so that it might truly be said of her "I have refined thee, but not with silver, I have chosen thee in the furnace of affliction;" and as obedience kept pace with knowledge, she was enabled to bear a living testimony to the gospel of Christ, which she had found to be the power of God unto salvation, and her anchor of hope and consolation, amidst the afflictions that were permitted to overtake her. The Monthly Meeting to which she belonged was prepared to acknowledge her gift, and she was recommended as a minister.

In the year 1799, she entered again into marriage with our friend, James Rowland. In the discharge of the interesting duties of wife and mother she was truly exemplary, and was remarkable for her care and tenderness towards all her household.

In her intercourse with her immediate friends and others, her Christian meekness and simplicity, combined with a soft and engaging manner, were peculiarly calculated to call forth the respect and esteem of those with whom she associated. By her neighbors she was much beloved.

Having drunk deeply of the cup of affliction, she was eminently qualified to administer the balm of consolation to those who were suffering either under bodily or mental trials, and her time was much occupied in following the example of our blessed Lord, in going about doing good.

Her labors of love were not confined to the precincts of our own religious Society, but her Christian benevolence extended towards all the children of one common Father. Hence, it was her meat and her drink, under the direction of her Heavenly Guide, to visit the abodes of sorrow, and in the chambers of sickness and death her ministering spirit was remarkably qualified to soften the anguish of the afflicted, and gently to point towards that divine source whence all consolation flows.

Having been an orphan herself, her heart was

opened towards this interesting portion of the community, and in her the young and inexperienced found a sympathizing friend.

She took great delight in reading the Scriptures of Truth to her children and other members of her family, and often quoted and applied them in a pertinent manner in her public communications.

She was diligent in her attendance of Meetings for worship and discipline, and manifested a continued concern for the promotion of truth, being remarkable for her solid and inward travail for the arising of that light and life which is the solace and crown of our religious assemblies.

Her public approaches to the throne of Grace were fervent and impressive, having a powerful tendency to solemnize the minds of the congregation, and to gather into the same deep and reverential feeling which influenced her exercised and devotional spirit.

She participated deeply in those trials through which Friends have recently passed, and long suffered in silence in the midst of many afflicting occurrences, which finally led to a division in our religious Society.

But having been preserved in a state of meekness and quiet suffering, she was again favored, in the renewed openings of truth, to stand as an instrument through whom the benign influence of gospel love flowed in our Meetings, to our encouragement and consolation, enabling us to raise thankful hearts to Him, who remains to be the Leader and Redeemer of his people.

In her last illness she was mostly confined for nearly five months, and although she passed through much bodily affliction, her mind was favored to experience resignation to the Divine will. She knew in whom she believed, and calmly reposed her confidence on that never-failing arm of Divine Power, which had supported her all her life long.

To a female friend who passed much time with her in her last illness, she stated that she had no prospect of recovering, and supposed it would be a satisfaction to her friends to know something of the state of her mind at that solemn period, and remarked that she had not left the work to be done at that late hour—that her day's work was finished, and she was patiently waiting for her change—that all was peace within and nothing in her way.

During the progress of her illness, she also expressed to the same friend, when speaking of the late division in our Religious Society, that she felt entire peace in the step she had taken in regard to this matter—that it was the result of much deliberate consideration—that she had never looked back at that act with regret, but on the contrary, the contemplation thereof was always attended with peace and satisfaction, and that her faith and hope remained firm and un-

changed in that divine arm of power which had been near and supported her through many trials.

After informing a friend who was sitting with her, that she had not been able to lie down for six weeks, owing to her cough and difficulty of breathing, the friend remarked that her nights must be trying; she answered, cheerfully, "Oh no—they are all peace. I often look round my chamber at night, and think it's all Heaven, although I have nothing to boast of. I have my low times, but it is a peaceful poverty, and this I consider a favor."

On another occasion she remarked to a friend and his wife who called to see her, "that she had experienced many long and tedious sicknesses, but never one in which she had been so uniformly favored with tranquillity and peace. And that during her illness she had been reminded of an expression of Samuel Emlen, 'That all was so calm there was not even a breeze to ruffle the surface.'"

A short time before her close, she expressed herself in substance that she was waiting to be released—that all was peace—and not a cloud in her way.

She quietly departed, as one falling into a sweet sleep, on the 9th day of the Second month, 1830, in the 64th year of her age. Her remains were followed to the grave by a large body of friends and fellow-citizens.

Thus it has pleased our great and Holy Head to remove one of his faithful laborers from the Church Militant on earth, and we humbly trust that her redeemed spirit, having been washed and made white in the blood of the Lamb, has been permitted to join the church triumphant in Heaven, and to receive the welcome sentence, "Well done, good and faithful servant, enter thou into the joy of thy Lord."

A parable by Krummacher.

THE REPRESENTATIVES.

A rich youth in Rome was suffering from a dangerous illness; at length he recovered and regained his health. Then he went for the first time into the garden, feeling, as it were, born again, and he was full of joy, and praised God with a loud voice. He turned his face to Heaven, and said, "O thou all-sufficient Creator, could man recompense thee, how willingly would I give thee all my possessions."

Thomas, who was called the herdman, heard this, and said to the rich youth, "All good gifts come from above; thither thou canst send nothing. Follow me."

The youth followed the pious old man, who took him to a dark hut, where there was nothing but misery and wretchedness. The father was stretched on a bed of sickness. the mother wept, the children were destitute of clothing, and crying for bread.

The youth was deeply touched. Thomas said, "See here an altar for thy sacrifice. See here the Lord's brethren and representatives."

Then the rich youth assisted them bountifully and provided for the sick man's wants. And the poor people blessed him and called him an angel of God.

Thomas smiled, and said: "Thus turn always thy grateful countenance first to Heaven and then to earth."

TANNERS'S LECTURES.

(Continued from page 103.)

There are repeated instances of another kind recorded both in the Bristol and Somersetshire minutes, in which parties to whom, on account of their misconduct, the permission to marry at meeting had been denied, persisted nevertheless in doing so. Expressions of regret from those who had prepared or signed certificates in such cases, were often recorded in the minutes. It is obvious that unless care had been taken to repress irregularities of this kind, there would have been an end to the orderly character of our marriage proceedings. In the Yearly Meeting's epistle of 1730, such proceedings are spoken of as being "of a clandestine nature," and are accordingly, advised against.

In 1692, a minute was adopted by the Bristol Two-weeks Meeting, requiring the parties who applied for leave to be married, to appear a second time before the meeting, to declare their intention of marriage. The object of this was, "to ennure them in speaking." complaint having been made that on marriage occasions the parties, and especially the woman, often spoke so low that what they said could not be "understood by half the meeting;" so that many Friends were "not free to subscribe as witnesses" to the marriage certificate. In the early part of the last century, the practice was adopted by the Somersetshire meetings, of appointing two Friends to attend marriages, to see that they were conducted in an orderly manner; but this practice was not adopted in Bristol until 1756. Among the early reports given to the Somersetshire meetings, by Friends so appointed, I find the following: "It was well, for what they saw." "Pretty well, considering the mix'd multitude." "Indifferent." "The people were very orderly, and things were well." In 1695, an intention of marriage is recorded in the Bristol minutes, between William Penn and Hannah Callowhill, daughter of Thomas Callowhill, of Bristol; and the publication of their marriage was reported to the Men's Meeting in the twelfth month of that year. In 1697, William Penn removed with his family to Bristol, where he resided about two years. A certificate of removal to Philadelphia was granted him in 1699, on the occasion of his going thither for the last time

There are some others of our Bristol minutes in which his name occurs, during his residence here. In 1697, he was appointed, with other Friends, "to visit our Latin schools, and give them counsel and advice as they shall see meet:" and a second minute appoints him, with other Friends, "to visit the schools of our Friends' children, to inquire into the order and manners thereof, (and) admonish against that they shall find amiss." In 1698, an intention of marriage is recorded between William Penn, Junior, son of William Penn, Esq. and Mary Jones, daughter of Charles Jones, merchant: William Penn, and Mary Jones' father and *grand-parents* being present gave their consent. In the second month of 1699, William Penn was appointed a representative to the Yearly Meeting in London.

It was probably during the period of William Penn's residence in Bristol, that he arranged the building of the streets to the eastward of the Friars' premises, which still bear the names of Philadelphia, Penn, Hollister, and Callowhill Streets. Hannah Callowhill, the mother of Hannah Penn, was a daughter of Dennis Hollister; and as the ground on which these streets were built adjoins the Friars, which Friends purchased of him, there is but little doubt that it formed part of his property. I believe also, as the result of an examination of a map of Bristol, in the office of our city treasurer, published in 1646, that some of these streets were built on the ground formerly occupied by the great orchard, in which the larger meetings of Friends were at first held. We have in our Monthly Meeting chest, the lease for a year of Pennsylvania, granted by William Penn and his son, preparatory to the mortgage on which several Friends of Bristol and other places advanced them, in 1708, the sum of £6,600: and also a trust deed relating to it.

It is well known to those who are acquainted with the history of William Penn's later years, what important assistance was rendered him in his unequal struggle with difficulties of various kinds, by the devotedness and sound judgment of his second wife. He also secured, whilst in Bristol, the services of another able helper, James Logan, whom he induced to accompany him to Philadelphia as his secretary. In the memoir of this remarkable man, published by Wilson Armistead, he is spoken of as possessing a powerful mind and extensive learning. Besides being appointed secretary to the province, he filled with great ability and integrity the offices of commissioner of property, chief justice, and for nearly two years, that of governor of the province, as secretary of the council. At his death he bequeathed a library of three thousand volumes, as a legacy to the new colony.* There is a remarkable paper at the end of the memoir, drawn up by James Logan, and addressed to *himself*,

which affords instructive evidence that his varied and engrossing public duties did not turn him aside from that still higher duty of walking with God, from which alone the ability is derived for the right discharge of our various stewardships.

The subject of the education and training of children in the early days of our religious Society, might well occupy more time and space than can here be devoted to it; my observations must be chiefly confined to a notice of our first Bristol and Somersetshire schools and schoolmasters. To those who wish to pursue the subject further, I would strongly recommend a perusal of the comprehensive and able statement upon this subject, contained in the papers read by the late Samuel Tuke, before the Education Society, at Ackworth. It is now nearly twenty years since the first of those papers was read, and having been a witness of the lively interest excited on that occasion, I regret that they are not better known. I must ask leave to refer to a few of the observations contained in them. After speaking of the evidence afforded by the memoirs of our early Friends, of the beneficial influence of the religious training then given, Samuel Tuke says, "It is not improbable, however, that some out of the very large number who joined the Society in early times, mistook the real character of the doctrine which they professed, in regard to the guidance of the Holy Spirit, so as to neglect the right use of means in the care and improvement of their families; and George Fox, who may be considered as the organ of the Society at that time, in several of his bold pastoral epistles, reproves this neglect in very strong terms." * Then follow extracts from these epistles, commencing from 1656. Writing in 1669, George Fox says, "Some among you breed up your children in such a rude, heady way, that when they grow up, they do not matter you, nor care for you: in many things they are worse than many of the world's, more loose, stubborn, and disobedient, so that when they come to be sent apprentice, they run quite out into the world." Ten years later, George Fox writes: "Now you having your food from Christ and God your Father, cannot you train up your children in the fear of God, and tell them from whence you have good things, that they may come to receive of all these good things from the good God, and Christ, the treasure of wisdom and knowledge; and that you may say, the children are the crown of your old men in the truth, and the glory of their fathers in God?" Again, in 1683, he says, "It is desired that all Friends that have children, families' and servants, may train them up in the pure and unspotted religion, and in the nurture and fear of God; and that frequently they read the Holy Scriptures, and

* Preface to Memoir, p. 6.

* Paper read in 1838, "Report, &c., of Friends' Education Society."

exhort and admonish them, that every family apart may serve and worship the Lord, as well as in public." Samuel Tuke says further, "It would not have been surprising if the religious and moral department of the subject of education had been the only one which occupied the particular attention of George Fox, but it was otherwise. In the year 1667, in the midst of various trials and persecutions, he mentions in his journal that he had recommended the establishment of two boarding-schools, one for boys and one for girls, in the neighborhood of London, for the purpose of instructing them 'in all things civil and useful in the creation.' This brief, but comprehensive phrase, is worthy of his large and enlightened mind."

I cannot undertake to decide how far the fatherly expostulations of George Fox were applicable to Friends of Bristol. Mention was made in my first Lecture, of the admirable constancy of the children in keeping up the meetings when their parents were in prison; but at that time, and for many years afterwards, constant reference is made to the disorderly conduct of some of the boys, both in meetings and in the neighborhood of the house during meetings; and committees were appointed month after month to repress these disorders. Many of these boys were probably the sons of those who were but slightly, if at all, connected with the Society; but in 1701, a paper was ordered to be drawn up on this subject and sent to all families of Friends, "for a caution to them." Another minute warns Friends, that if they neglect to restrain those under their care, from the folly and mischief practised during the time of meeting, "they must not take it amiss if they find their children and servants in Bridewell for such offence, since the Government is strict in this case for the suppression of vice and looseness."

The difficulties which had to be overcome in promoting school training among Friends, in the earlier days, were by no means slight. There was no lack of Friends well qualified to teach; but those of them who were willing to pursue this calling rendered themselves liable to prosecution if they did so; and in the event of a schoolmaster becoming a Friend, he would also be deprived of the support he had hitherto received, by the removal of pupils from his school. Many of the Friends again were too poor, and too much harassed by persecution to allow them to contribute much towards the education of their children. Under these circumstances the expedient was resorted to, in some meetings, of guaranteeing a certain sum from the funds of the Society; to which the condition was sometimes attached, that the children of poor Friends should be educated gratuitously in the schools so established. In 1668, one of the Bristol minutes states that a letter had been received from John Tappin, schoolmaster, signifying his willingness to come and

teach school on such terms and conditions for wages as Friends should judge meet. The minute proceeds, "It is ordered that he shall have £10 per annum out of the public stock, in consideration whereof he is to teach so many of poor children as shall be thought convenient by this meeting." In the following month these terms are repeated, with this addition—"It is concluded, that for the present he shall be allowed to teach in this room, provided that he be careful to have it made clean and ready for meetings every week, and such other services of truth as occasion may require."

(To be continued.)

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIFTH MONTH 7, 1859.

MARRIED, by Friends' ceremony, on 5th day the 28th inst., at the residence of the bride's father, J. GEORGE ORME, son of the late Edward H. Orme, to RUTH P. daughter of Richard Wilkins.

DIED, 4th mo. 23d, Sarah J. eldest daughter of Alexander S. and Lydia S. Truman, in her 9th year.

—, Suddenly, on the 17th of 4th mo. 1859, Azariah Brown, aged about 60, a member of Centre monthly meeting of Friends, Clinton County, Ohio.

—, In Philadelphia, at the house of Stephen Pancoast, on the morning of 20th inst. JANE H. BELL, eldest daughter of Thomas C. and Eliza H. Bell, of Flushing, Long Island, aged nearly 16 years.

Thus has another beautiful bud of promise been gathered from the parent stem, and transplanted in the garden of Paradise, to bloom in immortal beauty, free from the *briars* and *thorns* that so often wound and lacerate the young spirit that is bound to earth.

The death of this young and joyous child is calculated to touch the sensitive mind. She had been nearly three years a pupil of Friends' Central School in this City, beloved by her teacher and associated for her amiable and cheerful disposition, and at a time when her fond parents were looking forward to again having their beloved child with them, she is suddenly arrested by the messenger of death, and passed away to her eternal home.

After a solemn meeting she was interred in Friends' buryground at Flushing on the 22nd inst. M.

A WORD OF CAUTION.

During the travels of that eminent minister of the gospel Job Scott, he attended a youth's meeting held after the Quarterly Meeting at the Falls, 9th mo. 1st, 1786. The following remarks made on that occasion, are worthy of due consideration at the present day, and may have their use by being revived. H. P.

"We had in this meeting nine testimonies and a prayer. The Apostle says: "Let the prophets speak two or three, and let the others judge." Now though I have never thought that this by any means confines a meeting to two, three or four testimonies, yet I think it is worthy of serious consideration, whether Truth, strictly attended to, and its leadings deeply waited for, would, after two or three lively, powerful and moderately lengthy testimonies, often lead to

many further additions, and whether such additions are not, in general, as apt to hurt, as help the meeting. I would by no means limit to any number of appearances, nor cramp the right concern of any; but I do fear that out of the fulness of goodwill, and warmth of desire for the good and advancement of the hearers, meetings are sometimes hurt by unprofitable additions, and the savour under which they might have concluded in some degree taken off. Our God is a God of order, and if we keep to his leadings, *all things will be done decently and in order.*"

For Friends' Intelligencer.

LYDIA W. BLAKEY.

A short notice of the death of Lydia W. Blakey appeared some time since in the Intelligencer, a brief account at the time being thought most appropriate. It is with no view of praising one who never sought in her life to be known, and whose works alone praise her, that a little sketch is now given of her last sickness; but with a belief that that which has left so deep an impression with her friends, might be instructive to others. Her life and death add another, to the many evidences given of the sustaining power of faith, when the soul surrenders itself entirely to the Divine keeping. The subject of this notice was the daughter of James and Achsah Walton, of Byberry. She married, and after a few years she moved with her husband and young family to Fallston, Harford Co., Maryland. Throughout her life, she was ever gentle, modest and unassuming, and the same qualities continued to characterize her to the end. She occupied herself with her domestic cares and the training of her youthful charge, and in the unobtrusive performance of these duties she was the admiration of the few who had the privilege of knowing her intimately, but she was too diffident of herself, to be aware that she was regarded as an example. For more than a year before her death, her health was declining, and for many months it assumed a decided pulmonary form, showing the approach of the messenger that comes to all. But he came not an unwelcome visitant. Long an invalid, mingling with her family, she said but little of her prospects, yet doubtless was seeking strength to part with her earthly treasures.

That strength was found, for the tender and devoted mother surrendered her little ones, saying, "I give them up freely, freely." Her sick room was pervaded by an atmosphere of peace; the same meekness and quietness with which she seemed so peculiarly clothed while in her family, still was the covering of her spirit. It was a privilege to be with her, though she seemed not disposed to converse much, yet from the fulness of feeling, expression sometimes burst forth. At one time, while partaking of something which

she enjoyed, she said, "It is very good. I am so blessed, and my Heavenly Father has shed his richest blessings upon me;" every thing with her partaking of the hue of the spirit, which was indeed clothed with heavenly beauty. Upon another occasion, when something of an external character was brought into view which it was feared might agitate her, she said, "Nothing disturbs me now." Her soul was lifted above earthly things, and she was only quietly waiting for the veil of flesh to be removed, to enter into her home. At another time, when her cough was distressing, and expectoration very difficult, it was remarked by a friend, "It is hard work; I wish we could do it for thee;" she smiled and said, "No one can do our work for us." "No," it was rejoined, "but it is so comforting to know thy work is done." She said feebly, "But once in grace, not always in grace," meaning, it was supposed, she had still to watch, but added immediately what could only be heard in broken sentences, "Quietness and calmness—if I keep there,—peace." Again she said, "My faith—I laid up faith long ago, it has sustained me." The day before she died, she said, "I think the time has nearly come, and that I cannot last longer than this afternoon, as the phlegm is so hard to raise, but it makes no difference when"—the remainder of the sentence was not understood. When suffering greatly from oppression, the Scripture text was quoted for her encouragement, "Eye hath not seen, ear hath not heard, neither hath it entered into the heart of man to conceive the good things which the Lord hath in store for those who love him," she responded, "It is comforting, and there are many passages of Scripture that bear witness to our own feelings and experience, and they are a great comfort."—Yet it was not in what she said, for she did not seem disposed to give utterance much to her feelings, but quietly to commune with her own spirit, but in witnessing her calmness, patience and resignation, that she was to all around her so bright an example. Though stillness was the covering of the departing spirit,—yet the presence of Him who sustained her was felt to speak loudly to those who surrounded her, and who are prepared to respond to the language—

"The chamber where the good man meets his fate,
Is privileg'd beyond the common walks of virtuous
life,
Quite on the verge of Heaven."

It is not the quality of the meat, but the cheerfulness of the guests, which makes the feast.

Prosperity is no just scale; adversity is the only balance to weigh friends in.—*Plutarch.*

If a man cannot find ease within himself, it is to little purpose to seek it anywhere else.

A generous mind does not feel as belonging to itself alone, but to the whole human race.

From the Patent Office Report.

ON THE PRACTICABILITY OF THE TEA-CULTURE
IN THE UNITED STATES.

(Continued from page 108.)

MODES OF PACKING AND TRANSPORTATION OF THE TEAS.

The tea-farms in China are generally of small extent, no single one probably producing more than 600 chests of tea. What are called "chops," or parcels, are not made up by the small farmers, but in the following manner: A tea merchant, for instance, from Tsonggan or Tsin-tsun, either goes himself, or sends his agents, to all the small towns, villages, and temples in the district, to purchase teas from the priests and growers. When the teas so purchased are taken to his house, they are mixed together, keeping those of different qualities as much as possible apart. By this means a chop of 620 or 630 chests is made, and all the tea of this chop is of the same description or class; sometimes a chop is divided into two packings, consisting generally of 300 chests each. If it were not managed in this way, there would be several kinds of tea in one chop. The large merchant in whose hands it now is, has to re-fire it and pack it for the foreign market. When the chests are packed, the name of the chop is written upon each. Year after year, the same chops, or rather those having the same names, find their way into the hands of the foreign merchant. Some, consequently, have a better reputation, and command a higher price than others. It does not follow, however, that the chop of this year, bought from the same man and bearing the same name as a good one of last year, will be of equal quality; for it is by no means unusual for the merchant who prepares and packs the tea to leave his chests unmarked until they are bought by the man who takes them to the port of exportation. This man, knowing the chop names most in request, can probably find a good one to put upon his boxes; at all events, he will take care and not put upon them a name which is not in good repute.

A chop of tea having been purchased in the neighborhood of Woo-e-shan, for instance, by one of these merchants, a number of coolies are engaged to carry the chests northward, across the Bohea Mountains, on their way to Canton or Shanghae, the ports of exportation, by the way of Tsong-gan-hein and Hokow, or rather to the small town of Yuen-shan a few miles from Hokow, to which it is sent by boat. If the tea is of a common kind, each coolie carries two chests slung over his shoulders, on his favorite bamboo.

Whenever he rests, either on the road or at an inn, the chests are set down upon the ground, which is often wet and dirty, and consequently they are liable to get soiled. The finest teas, however, to preserve them from injury, are never allowed to touch the ground while on their journey, but are carried on the shoulders of the coolies in the following manner: Two bamboos, each about 7 feet long, have their ends lashed firmly

to the chest, one on each side. The other ends are brought together so as to form a triangle. By this means a man can carry the chest upon his shoulders, with his head between the bamboos in the centre of the triangle. A small piece of wood is lashed under the chest to give it an easy seat.

When the coolie who bears his burden in this way wishes to rest, he places the ends of the bamboos upon the ground and raises them to a perpendicular. The whole weight now rests upon the ground, and can be kept in this position without much exertion. This is very convenient in coming up the steep passes among the mountains, for in some of them the coolies can only proceed a few yards at a time without resting, and if they had not a contrivance of this description, the loads would have to be frequently put down on the ground. When stopping at inns or tea shops for refreshments, the chests carried in this way are set up against the wall, and rest upon the ends of the bamboos. * * * *

If intended for the Shanghae market, the tea boats proceed up the river King-keang in an easterly direction to the town of Yuk-shan. This stream runs very rapidly, and, upon an average, at least four days are required for this part of the journey. In coming down the river, the same distance is easily accomplished in a day. When the tea chests arrive at Yuk-shan, they are taken from the boats to a warehouse. An engagement is then entered into with coolies, who carry them across the country in an easterly direction to Chang-shan, in the same manner as they were brought from Tsong-gan-hein to Hokow. The town of Yuk-shan, it will be observed, is at the head of a river which flows west to the Poyang Lake, while that of Chang-shan is situated on an important river which falls into the bay of Hang-chow on the east. Travellers in chairs accomplish the distance easily in a day, but coolies laden with tea chests require two or three days. When the teas arrive at Chang-shan they are put into boats and conveyed down the river to Hang-chow-foo, occupying five or six days. At Hang-chow-foo the chests are transhipped from the river boats to those which ply upon the canals, and in the latter are taken on to Shanghae, which occupies about five days. * * * *

DYEING GREEN TEAS.

As many persons in this country, as well as in Europe, have a peculiar taste for "colored" green teas, the following account of the coloring process, given by Mr. Fortune, as practiced in the Hwuy-chow green tea district upon those teas which are destined for the foreign markets, may not prove uninteresting to the American reader. The following is extracted *verbatim* from Mr. Fortune's Note Book:

'The superintendent of the workmen managed the coloring part of the process himself. Having procured a portion of Prussian blue, he threw it into a porcelain bowl, not unlike a chemist's

mortar, and crushed it into a very fine powder. At the same time, a quantity of gypsum was produced and burned in the charcoal fires which were then roasting the tea. The object of this was to soften it in order that it might be readily pounded into a very fine powder, in the same manner that the Prussian blue had been. The gypsum, having been taken out of the fire after a certain time had elapsed, readily crumbled down, and was reduced to powder in the mortar. These two substances, having been thus prepared, were then mixed together in the proportion of four parts of gypsum to three parts of Prussian blue, and formed a light blue powder, which was then ready for use.

"This coloring matter was applied to the teas during the last process of roasting. About five minutes before the tea was removed from the pans—the time being regulated by the burning of a joss-stick—the superintendent took a small porcelain spoon, and with it he scattered a portion of the coloring matter over the leaves in each pan. The workmen then turned the leaves rapidly round with both hands in order that the color might be equally diffused.

"During this part of the operation the hands of the workmen were quite blue. I could not help thinking that if any green-tea drinkers had been present during the operation, their taste would have been corrected, and, I may be allowed to add, improved. It seems perfectly ridiculous that a civilized people should prefer these dyed teas to those of a natural green. No wonder that the Chinese consider the natives of the West to be a race of 'barbarians.'

"One day an English gentleman in Shanghai, being in conversation with some Chinese from the green tea country, asked them what reasons they had for dyeing the tea, and whether it would not be better without undergoing this process. They acknowledged that tea was much better when prepared without having any such ingredients mixed with it, and that they never drank dyed teas themselves, but justly remarked that, as foreigners seemed to prefer having a mixture of Prussian blue and gypsum with their tea, to make it look uniform and pretty, and as these ingredients were cheap enough, the Chinese had no objection to supply them, especially as such teas always fetched a higher price!

"I took some trouble to ascertain precisely the quantity of coloring matter used in the process of dyeing green teas, not certainly with the view of assisting others, either at home or abroad, in the art of coloring, but simply to show green-tea drinkers in England, and more particularly in the United States of America, what quantity of Prussian blue and gypsum they imbibe in the course of one year. To 14½ pounds of tea were applied 8 mace 2½ candareens of coloring matter, or rather more than an ounce. In every hundred pounds of colored green tea consumed in England

or America, the consumer actually drinks more than half a pound of Prussian blue and gypsum. And yet, tell the drinkers of this colored tea that the Chinese eat cats, dogs, and rats, and they will hold up their hands in amazement, and pity the poor Celestials!

"Two kinds of Prussian blue are used by the tea-manufacturers—one is the kind commonly met with, the other I have seen only in the north of China. It is less heavy than common Prussian blue, of a bright pale tint, and very beautiful. Tumeric-root is frequently employed in Canton, but I did not observe it in use in Hwuy-chow."

From the foregoing it would seem that we have a soil and climate possessing the conditions necessary for the production of the tea plant in a large portion of our territory, and that it only requires enterprise, capital, and intelligence to bring this branch of industry into successful competition with the Celestials. To meet the objection often raised against the profitable culture of tea in this country, of the very low wages in China as compared with our own, it may be stated that, with improved machinery and other appliances for manipulating and preparing the article, which would result from American skill, with the aid of a few Chinamen, at first; our facilities for transportation to a ready market, and the robust, well-fed laborers, there can be little doubt that we can out-rival, at least for local consumption, the primitive utensils, tedious manipulations, the want of railroads, canals, steam navigation, and even of common roads, and consequent expensive transport of the enfeebled and poorly-fed Asiatics, to say nothing of extra packing, transit and export duties, port charges, cost of putting on ship-board, freight, insurance, interest on capital invested, cartage, storage, commissions, profits of the importer and venders, as well as the cost of transportation to the place of consumption in the United States.

AGRICULTURAL SOCIETIES AND COLLEGES.

In the last Patent Office report there is a very interesting sketch of the origin, number, condition, &c., of the various county and State organizations in existence throughout the United States for the promotion of Agriculture, from which the following abstract is prepared:

The first agricultural association incorporated in this country was the "Society for the Promotion of Agriculture," established in South Carolina in 1785. In 1791 a "Society for the Advancement of Agriculture, Arts, and Manufactures" was founded in the city of New York, but it ceased to exist in about ten years. Next in chronological order is the "Massachusetts Society for Promoting Agriculture," which was incorporated in 1792, and contributed largely to the advancement of its objects. Some of its

members, residing in the county of Middlesex, afterwards organized the first county agricultural association formed in the United States. Several other societies of the same kind sprung into existence within a few years, and in August, 1810, Elkanah Watson of Berkshire, Massachusetts, was instrumental in getting up the first agricultural fair ever held in America. From that time efforts in behalf of agriculture received a new impulse, and associations were soon formed in most of the older States. The "American Institute of the City of New York" was incorporated in 1828, rendering efficient service; and four years after the New York State Agricultural Society commenced its useful career. At the present time societies or boards of a similar character have been incorporated in nearly all the most populous States, besides numerous county societies, all having the same objects in view, making an aggregate of about eight hundred distinct organizations.

Agricultural education is a subject which, until recently, has received comparatively little attention, and very little direct aid either from the national or State treasuries. In the year 1855 the citizens of Ovid, Seneca county, New York, succeeded in procuring the passage of an act by the Legislature incorporating the "New York State Agricultural College." This institution, it is thought, will prove a success. The act by which it was organized provides for loaning from the surplus of the United States deposit fund \$40,000 for twenty-one years, without interest, provided an equal amount should be obtained by private subscription. A farm of 680 acres has been selected, and the buildings are in progress. A kindred institution, known as the "People's College," was chartered by the State of New York in 1854, to be located in Havana, Schuylcr county. The buildings are in process of erection on a farm of two hundred acres.

The Legislature of Michigan has, at different periods, appropriated \$90,000 for the establishment of an Agricultural College at Lansing. A tract of seven hundred acres is connected with it. The first class of students was received in 1857.

The "Farmers' High School of Pennsylvania" was incorporated in 1855 under the auspices of the State Agricultural Society, and comprises, with the buildings in the course of erection in Centre county, a tract of four hundred acres. It has a capital of \$100,000, one-half of which was appropriated by the Legislature. It is expected to be open for instruction during the present year.

Maryland is also making an effort for the establishment of a similar institution, and a farm of four hundred and twenty-eight acres in Prince George's county, has recently been purchased upon which to erect the proposed buildings.

In addition to the above scientific schools, experimental grounds and agricultural professorships have been established in connection with many of the literary institutions of the country. — *Boston Journal*.

FARMERS' HIGH SCHOOL.

We find in a recent number of the *Lancaster Express*, the following interesting information relative to the "Farmers' High School:"

"It is generally known that the farm contains 400 acres. The soil is mellow calcareous loam, varying slightly in texture in different parts. There is no steep ground on its whole area; the general slope is a gentle inclination to the southeast. The site is one of the most elevated in this whole series of limestone valleys, being on the dividing plateau which separates the waters of the Juniata from those of the West Branch of the Susquehanna. It is nine miles Southwest from Bellefonte, a country seat and manufacturing town, which, in a few months, will have direct railroad communication with all the centres of trade and population. There is no swamp, nor source of atmospheric vitiation between it and the mountains, which sweep around at some miles distance. An act has recently passed, making it illegal for the Court to grant license for the sale of spirituous liquors within two miles of the institution.

The nursery covers about six acres. The work in this department will be especially adapted for the instruction and practice of students. The collections have been enriched by liberal contributions from Pomologists and Horticulturists in this and many other States and counties. There are over 21 acres planted in orchards on the north and west side of the barn. It consists of a peach orchard of five hundred trees, and an apple orchard of fall and winter sorts of four hundred trees, eighty autumn and winter pear trees, and vineyard. Behind the farm house are two small enclosures of 2 acres 32 perches, and 2 acres 100 perches, containing summer pears, mulberries, quinces, plumbs, duke cherries, nectarines, &c. All these orchards are fringed along the front with a handsome and symmetrical growth of large-leaved cherry trees, comprising a full assortment of the Heart and Bigereau classes. South of the buildings is an orchard of summer apples of one hundred and forty-four trees. The vineyard contains two acres, and is planted with 2,050 vines, of many sorts, about half being Isabellas. About two and three-fourths miles of hedge is already planted, consisting of different kinds of plants; shavings are used to choke down the grass and weeds. No particular part of the grounds has yet been laid out for an experimental department. One hundred and ninety-six experimental trials of processes and applications have been instituted, and regularly registered and numbered; the beds and rows used are conspicuously

labelled and described on the grounds as well as in the books; and if this department can be consolidated and systematised, visitors will be able to see for themselves what trials are under way, and can make their own examinations and deductions almost without a guide."

PROGRESS.

How quiet is the path of excellence!

Mark the still movement of a summer's day,

From early morning's dust of pearly gray,

To eve's rich glow of golden opulence.

Thoughtfully note its calm magnificence,

When there has been no jagged lightning's play,

No howling winds with thunder-clouds at bay,

The mind to stir with wild significance.

Ponder the marvels that in these days dwell!

What growth, what progress, in this radiant calm—

While raptured angels fill the air with balm

Their prone delight these days serene to tell.

Nations must learn this lesson of the skies—

Nations, as men, if they from chains would rise.

A. P. C.

LIVE FOR SOMETHING.

Live for something, be not idle—

Look about thee for employ!

Sit not down to useless dreaming—

Labor is the sweetest joy,

Folded hands are ever weary,

Selfish hearts are never gay,

Life for thee hath many duties—

Active be, then, while thou may.

Scatter blessings in thy pathway!

Gentle words and cheering smiles

Better are than gold and silver,

With their grief dispelling wiles.

As the pleasant sunshine falleth

Ever on the grateful earth,

So let sympathy and kindness

Gladden well the darkened hearth.

Hearts there are oppressed and weary;

Drop the tear of sympathy,

Whisper words of hope and comfort,

Give, and thy reward shall be

Joy unto thy soul returning

From this perfect fountain head,

Freely as thou freely givest,

Shall the grateful light be shed.

C. SWAIN.

CARPETS AND CARPET-MAKING.

Carpets were introduced into Europe from the East, where they were in use from the remotest times. So lately as in the reign of Queen Elizabeth, of England, the royal presence chamber was strewn with rushes. Her contemporary, Henry IV, introduced the carpet manufacture into France. Seventy years later, Colbert, the financial minister of Louis XIV, established a Government carpet-manufactory at Beauvais, which is yet in operation. A few years before this James I, invested nearly £3,000—a large sum in those days—as partner in a carpet-manufactory at Mortlake, in Surrey. Carpets are now made in many parts of England, and very largely in Kil-

marnock, in Scotland. They are manufactured in great quantities and of excellent quality, in Pennsylvania, New Jersey, New York, Massachusetts, Rhode Island, and Connecticut. The value of the carpets annually made in this country may be estimated at about \$6,000,000. Carpets are imported from England to the annual value of \$2,500,000. This makes a total of \$8,500,000 expended in the United States alone for carpets. It is worthy of notice, as showing how much more luxurious is American than English housekeeping, that while the great demand in this country is for the best carpeting, the English consumption runs much more largely upon second and third class qualities.

We have alluded to the antiquity of carpets, and to their Oriental origin. The process of manufacture can be very readily traced. At first, in the nomadic stage, the ground covered by tents was strewn with rushes, straw, or reeds. When permanent habitations were erected, the same process was continued, and the materials were plaited into matting. Where wool abounded, and the pastoral was the earliest way of life, that material (as subsequently in England) was woven into a coarse cloth for the floor. It is known that, in very remote times, this was done in Egypt, and that it had been carried to a great degree of perfection, in Persia and India, centuries before the process had been introduced into Europe. From the East, however, the conquering Greeks brought beautiful carpets, among other spoils of war, and used them, upon gala occasions, upon and beneath their couches. Sometimes adorned with the figures of wild beasts, whose skins were frequently strewn upon the floors, it is believed that they resembled tapestry rather than carpets, and were made by introducing tufts of woollen yarn into a warp stretched in a frame, each row of tufts being held down by a woof passed and tightly pressed down upon it by the shuttle. The tufts, which to this day are clipped to a proper length when the work was ended, are now uniformly shorn to the necessary extent by machinery. Even now, the Persian, Turkey, and other Asiatic carpets are thus made. Their size is rarely large; but the colors are bright, the patterns curious, and the texture so soft that the foot literally sinks into it, just as if the step fell upon the meadow sward. In some parts of India velvet carpets are made, the material being silk. Gold thread is sometimes introduced, but this is rare and expensive.

Within the precincts of Philadelphia alone, six and a half million yards of ingrain carpet, value \$2,600,000, are annually produced.

In the Glen-Echo Mills, where, besides working numerous looms, large motive power is required for auxiliary purposes, a steam-engine of forty horse power is in constant use. With that careful economy which saves money while it simplifies operations, the drying of the dyed yarn

takes place in a room erected over the furnace by which steam is generated. The gas and heat produced in the furnace, instead of being permitted to escape up the chimney, are conducted seven times round, by flues, between the roof of the furnace and the floor of the drying room.

The steam, having performed its work, in and for the engine, is what is called "exhausted," but still is made serviceable, instead of being allowed to escape. It is directed into the dye house, where it communicates sufficient heat to the water in the dye vats, after which, "pretty well used up," it is allowed to pass off, in a liquid form. We have, however, to begin at the beginning, and make our readers as wise—on carpet making—as we became in three hours' travel over McCallum & Co.'s manufactory. We commence, to do it properly, with the raw material. Whoever has seen the beautiful processes of cotton spinning, or of weaving cloth or linen, will readily understand how carpets are woven. For the many, however, we have to go into details.

Wool, the material for carpets, is almost wholly imported from Europe, Asia, and South America. A small quantity is of domestic growth. Of the European and Asiatic import, by far the greater portion passes through England. Spanish and Australian wool is not well adapted for carpets, but the very fineness which disqualifies it for that purpose, eminently fits it for the manufacture of broad cloth. The colder the climate, the longer the wool, and *vice versa*. Wool from the northern frontiers of Russia, for example, has a more hairy appearance than the soft wool from the temperate or warm climate of Australia and Spain. Russian wool, largely produced, is shipped at Odessa. Smyrna also supplies considerable quantities. The supply from South America is large.

Received into the mills, the wool is subjected to several successive processes. It is washed, carded, combed, spun, reeled, and woven into carpets. Each process, now executed by steam machinery, (which does the work of 1000 persons in the time one used to occupy, and yet increases the number of workmen,) was formerly done by hand, and, without any disrespect to our ancestors, was done very clumsily, defectively and expensively.

The wool, taken from the package, is washed, and put into machines, which pull it out, loosen it, disengage it from dirt and dust, and convert it into what is called roving. First, it is picked; then it is dusted; next it is oiled; then it is re-passed through the machine; then it is combed, whereby the long fibres are separated from the short; and here, from the combing machine, the wool flows out continuously, looking indeed, like an endless stream of water. The small or short wool is cast out at the sides of the combing machine, and comes out in front, in this continuous manner, winding itself into tin cans, the contents of many of which are repeatedly passed through

other machines, each passage at once attenuating it—making it firmer, as well as finer, and eventually taking the twist out of the fibre, so that each woollen thread becomes smooth and even, and thoroughly easy for working. By the time that the wool gets into roving it has passed through 1,250 distinct operations. From roving, it is converted into simple yarn, which, when doubled, forms the warp. For the information of some readers, we add that the threads which run the whole length of the carpet make the warp; those which run the breadth of the carpet, and constitute the filling, are called the woof.

The yarn, thus made, is next removed to the dye-house, where it obtains the various colors for which it may be destined. The pure atmosphere of our climate, more equable in Pennsylvania than in any other State, allows of the most beautiful and vivid tints being given to the woollen yarn.

The ingrain carpets (two-ply) are made with two sets of worsted warp and two of woollen woof. There is always a difference of texture in the warp and woof, the latter having a coarser wool. A two-ply consists of two distinct webs incorporated into each other at one operation, the warp threads passing from one to the other to bring the required colors to the surface. If the carpet were split, each web would appear as a separate cloth, with a coarse surface like baize. In the two-ply ingrain carpets (commonly called Kilmarnock, from the Scottish town where they were chiefly made) two colors only are used to best advantage, more tending to give the carpet a striped appearance.

After the ingrain carpets are manufactured, each piece is subjected, inch by inch, to minute inspection, for the purpose of removing knots, taking up fallen stitches, and obtaining general uniformity of surface. There can be very few serious defects in a well-made ingrain carpet, for when a thread breaks, the Jacquard loom immediately stops, and the weaver has to make a proper joining before he can go on.

This we say, on the authority of Mr. McCallum, that the readiest and most effective way for wearing out even the best carpets, is to spread newspapers or straw beneath them. Thereby the carpet is loose when first laid down, and gets looser and looser constantly—a fit state, indeed, for the shoe to run it into holes in double quick time. The proper way of laying down a carpet, so as to get the greatest quantity of wear out of it, is to have it strongly sewed, exactly adjusted to the size of the apartment, and laid down by straining it as tightly as possible, so that it may lie upon the floor perfectly even.

True prayer is not human, but a celestial gift; the fruit of the Holy Spirit praying in us and with us.

THE RACES OF ALGERIA.

At a late meeting of the Boston Society of Natural History, Dr. Bodichon, a resident of Algeria, in Africa, presented a paper on the races of that country, founded on his own observation. He stated that there were two white races; one inhabiting the mountains, the Numidians or Berbers, and the Arabs. The former were small in stature warlike, independent, democratic, and polygamous. They dwell in villages, and plant vineyards. They are fine soldiers, able to compete with Europeans. They are not governed by laws, but refer their difficulties to the first man that chances to pass by. Dr. B. considers them an indigenous race. The Arabs are a tall race, of dark complexion, equestrian, nomadic, warlike, religious, poetical and polygamous. They divide their time, about equally, between fighting and praying. He also referred to a mixed race of Turks, and the women of the different tribes of the country, which, not having the stamina of the parent races, are fast disappearing before the French. He found in the interior of Africa a Germanic race, with blue eyes and light hair, which are probably the descendants of the ancient Carthaginians. They are polygamous, and, unlike all other nations, the females are sovereign, both in family and state.

ACTION OF SUGAR ON THE TEETH.

M. Larez of France, in the course of his investigations on the teeth, has arrived at the following conclusions: First, that refined sugar, from either cane or beets, is injurious to healthy teeth, either by immediate contact with these organs, or by the gas developed owing to its stoppage in the stomach; second, that if a tooth is macerated in a saturated solution of sugar, it is so much altered in the chemical composition that it becomes gelatinous, and its enamel opaque, spongy, and easily broken; third, this modification is due, not to free acid, but to a tendency of sugar to combine with the calcareous basis of the tooth.

THE EARTHQUAKE IN ECUADOR—FROM 2000 TO 5000 LIVES LOST.

On the 22nd day of March, at half-past eight in the morning, an earthquake, which shook the mountain range of the Chimborazo for the space of four minutes, destroyed almost entirely the city of Quito, and killed from 2000 to 5000 persons.

The churches, Monasteries, convents and state edifices are almost all rent into fragments. The Convent of San Augustino, the Tabernacle de la Capilla, the Temple of the Segriara, the Cathedral, the Convent of Santa Catalina, the Palacio del Obispo, the Chapel of la Merced, the Chapels of the Compania, of the Hospital of Carnien Vajo, the cloisters of the Convent of Santa

Domingo, a part of the Couvictorio of San Fernando, are all partially or wholly in ruins. Also the Convents of San Diego, Santa Clara and Santa Barbara. There is scarcely a house in the city that is not badly damaged.

That portion of the Palace occupied by the Minister of Interior, a great part of the College of San Luis, the splendid mansion of Dr. Albuja, have also fallen. All the principal buildings of the neighboring towns of San Antonia, Cotocolla, Machacha, Chillogallo, and Magdalena have been destroyed. The loss of property is estimated at three millions of dollars; and from the poverty of the people it will be impossible to repair and rebuild any great number of the better class of edifices destroyed. The shocks were felt simultaneously in Tacunga, Ambato Alausi, and in Tinpullo the earth opened in various places. The earthquake was also felt at Guayaquil, but did no damage there.

The temples of San Francisco, del Sagario and Santa Clara were of beautiful architecture; the temples and convents of Santa Domingo, la Merced and San Augustin, all had fine stone facades and towers; the temples of Santa Catalina and Conception, and the hospital, had also stone facades.

Quito is said to contain about 50,000 inhabitants. It is built on an extensive plain, against the mountains of Panecillo and Pichincha, and is about 9,500 feet above the level of the sea. Most of the houses are two stories, some three and a part one story. Many are build of burnt brick, with handsome facades, but the greatest portion are unburnt brick or adobe.

The greatest distress and consternation prevailed at Quito when the mail left. Thousands of persons have been left houseless and the government and Church are not only too poor to afford relief to the houseless and destitute, but are without means to rebuild the public edifices. The poor sufferers will have to shift for themselves, unless relief is sent from abroad.

It is reported that quite a number of small towns to the north of Quito have also been destroyed, and in this city the shock was severely felt and did some damage to a few houses, but our buildings are so constructed as to withstand more than an ordinary shock of earthquake.—*P. Ledger.*

ITEMS OF NEWS.

THE Cincinnati *Gazette* says the latest advices in regard to the high water in the Lower Mississippi, are of an alarming character. The numerous crevasses have resulted in the overflow of large tracts of country and the destruction of stock, crops, and improvements to an almost incalculable amount. From Memphis down, the river is described as spreading on either hand like a sea, and the marks of desolation are everywhere visible. Scores of plantations and villages are either overflowed or rendered almost uninhabitable.

ARTESIAN WELL.—The artesian well in Kentucky discharges 230 gallons of water per minute, or about 330,000 gallons in twenty-four hours. The water flows with such force that it rises in pipes, by its own pressure, 170 feet above the surface. Its force is estimated to be equal to that of a steam engine of ten-horse power. The water is perfectly limpid, with an invariable temperature of $76\frac{1}{4}$ degrees.

THE TRUSTEES of the New York Inebriate Asylum have issued an appeal to the churches of the United States, and the American public, for assistance. Some of the statements are most startling, as for example, the following:

"Who can doubt the importance of such an asylum when, even before its first story is completed, applications have been made for admittance, many of which are from patients themselves? Among the applicants are twenty-eight clergymen, thirty-six physicians, forty-two lawyers, three judges, twelve editors, four army and three naval officers, one hundred and seventy-nine merchants, fifty-five farmers, five hundred and fifteen mechanics, and four hundred and ten women, who are from the high walks of life. Of the vocation of the remaining applicants we have no knowledge.

Within the past two years New York has lost by death two of her Supreme Court Judges, and one of her county judges, all of whom died by inebriety, and all of whom were applicants for admission to this asylum."

These facts are designed to show the necessity of an asylum adapted to the control, treatment, and cure of a diseased appetite. Then follow statements of another character to prove the feasibility of the undertaking, from a narrative of individual cures of inebriety effected in some asylums—concluding with the assertion that more than one hundred cases of this description might be mentioned.

SENATOR SUMNER.—The Washington correspondent of the *Commercial Advertiser* learns from a private source that the health of Senator Sumner of Massachusetts, is far from being restored, and that he is not likely to recover so far as to be able to resume his seat in the Senate at any time during the term for which he was elected.

TEA.—The export of tea from China to the United States shows a decrease of 807,000 pounds from the same time last year.

THE JAPANESE MINISTERS ON THEIR WAY TO THE UNITED STATES.—The names of the Japanese Ministers, on their way to the United States, are Nagaai Genbano-Kami, Governor of Accounts and Minister of the Navy, and Twa Say Higo-no-Kami, Imperial Inspector.

"The first is said to be an intelligent man, and well educated, having been instructed by some officers of the Dutch navy at Desima in algebra, mathematics, and navigation. In 1857, he conducted the steamer Soemting, the first ever possessed by the Japanese, from Nagasaki to Yeddo, with Japanese engineers and sailors, and without any Dutch or European aid. Twa Say Higo-no-Kami is also an intelligent man, and has acquired some knowledge of foreign politics from his intercourse with Mr. Harris especially, and from the Dutch and other foreigners."

WM. B. REED, late United States Commissioner to China, has arrived at London.

EMIGRATION.—A large number of colored people in Chicago are making preparations to emigrate to Hayti, having accepted an invitation from President Geffard to settle on the Island.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is inactive, and prices are unchanged. We quote sales of super-

fine Flour at \$6 25 a 6 50 and \$6 75 a 7 87 for extra family. The sales to the retailers and bakers are within the range of the same figures. Sales of Rye Flour and Corn Meal continue limited. The former at \$4 25 per bbl. Corn Meal is held at \$3 88, for Pennsylvanian.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 59 a 1 60 per bushel for fair and prime red, and \$1 65 a 1 75 for white in store. Rye is in demand, and sells at 89 cents. Corn is in demand; sales of yellow at 88 a 89 cents, Oats are in good request; sales of prime Pennsylvania at 55 a 56 cents, and of Southern at 54 cents. Barley is dull at 75 cts. per bushel, and Barley Malt at 95 cts. a 1 00.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,

Cheap School Book Depository, 1336 Chestnut st.

HIGHLAND DALE.—Charles and Catharine Foulke inform their friends that their house will be open for the reception of boarders, early in the 6th month. It is an elevated situation, one mile from Stroudsburg, and four miles from the Delaware Water Gap.

The cars leave Walnut Street wharf every morning for Stroudsburg.

The price of board in 6th and 7th months, will be \$6 per week, and in the 8th month, \$7 per week. Children under 12 years, half price.

4th month, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next session of this Institution, on the 2d of 5th mo. next. For reference and further particulars, enquire for circulars of Principal,

BENJAMIN SWAYNE.

London Grove, 22d of 3d mo., 1859.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON,

MAGGIE B. JACKSON,

Assistants.

Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER,

SUSANNA G. CHANDLER,

Proprietors.

3d mo. 19, 1859.—10 t.

Merrilow & Thompson, Prs. Lodge street, north side Penna. Bank

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIFTH MONTH 14, 1859.

No. 9.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of postage, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.
(Concluded from page 116.)

On Divine Worship.

John. In a former conversation the subjects of repentance and conversion were discussed, and we were shown the necessity of being "born again of incorruptible seed, by the word of God, which liveth and abideth forever." There is another subject of much interest which I desire to understand, and that is the right mode of worshipping the Divine Being.

Father. This is a subject of deep interest to every awakened mind, and I shall endeavor to state my views upon it for your serious consideration; not wishing you to adopt them any further than you may be convinced in your own minds of their truth.

James. There is a wide difference among Christians of various denominations in their manner of worship, and yet most of them profess to derive their views from the same source. The Catholics have their stated forms of prayer and praise, many of which are repeated in a dead language; the Episcopalians have theirs all written and repeated in the English language; the Presbyterians have no forms for their prayers, but their hymns are set to music, and sometimes accompanied by the organ; the Methodists and Baptists have mostly discarded the instrumental music, but still retain the vocal,—while the Friends, or Quakers, have relinquished both, and all set forms of prayer and preaching, deeming neither indispensable to Divine worship, which they believe may be acceptably performed in silence. Now, if the Bible be so perfect a rule as is generally stated, how is it that all these people

differ so much in their views, for they all appeal to it for authority?

Father. The Old Testament is very explicit in stating the form of worship and all the ceremonies enjoined upon the Jews, because that was an outward dispensation, intended to typify and lead to a spiritual dispensation; and its end being accomplished, it was abrogated by the coming of Christ. Now we may remember he said to the woman of Samaria, "The hour cometh and now is, when the true worshippers shall worship the Father in spirit and in truth, for the Father seeketh such to worship him. God is a spirit, and they that worship him, must worship him in spirit and in truth."

I have no doubt that this spiritual worship,—this communion of the soul with the Father of spirits,—has been, and still is performed at times by the pious and sincere worshippers in all the various sects of Christendom;—the question is, which of the various forms of worship is most consistent with the Christian dispensation, and best adapted to promote true spiritual worship.

John. I think it is much to be regretted, that the writers of the New Testament were not a little more explicit in regard to the manner of worship, for there has been a great deal of disputing about it among the professors of Christianity.

Father. I do not think so. For Christ said to his disciples, "I have yet many things to say to you, but ye cannot bear them now; howbeit, when he, the Spirit of Truth, is come, he will guide you into all truth: for he shall not speak of himself, but whatsoever he shall hear, that shall he speak: and he will show you things to come. He shall glorify me, for he shall receive of mine, and shall shew it unto you." John xvi. 12-14. Was it not much better to direct their attention to the teachings of the Spirit of Truth, (which he has promised to all those who wait upon him) than to give them verbal or written instructions about the manner of worship, which perhaps they were not in a state to receive?

John. Those who were to be guided by the Spirit of Truth, or indued with a miraculous gift of the Holy Ghost, did not need such particular directions, but if the apostles, while under the influence of this power, had written a more minute account of their forms of worship, it might have saved a great deal of controversy.

Father. True spiritual worship does not de-

pend upon any form, but upon the power or influence under which it is performed. "The kingdom of God is not in word, but in power." 1 Cor. iv. 20. It is not necessary that we should use the same form of worship that the apostles did,—but it is absolutely necessary that we should be governed and influenced by the same power, or spirit of truth; for without it we cannot even think a good thought, much less can we perform, acceptably, the solemn service of Divine worship. The apostle Paul said, "We are not sufficient of ourselves, to think anything as of ourselves, but our sufficiency is of God, who also hath made us able ministers of the New Testament; not of the letter, but of the spirit; for the letter killeth, but the spirit giveth life." 2 Cor. iii. 5, 6.

John. But would not the same spirit always lead into the same form?

Father. It will always produce the same fruits of holiness, but not always the same form of worship; for the Divine Being adapts his instructions and requisitions to the state of the people whom he visits. His mercy and his condescension to the children of Israel were so great, that he gave them an outward law, adapted to their weak, carnal state; and he made that law a figure, or shadow of good things to come, so that they might be led by the shadow to seek for the "substance, which is Christ." It is evident that the prophets and other holy men who lived under the law, did come to the knowledge of Christ; for the apostle Peter says expressly, that "the spirit of Christ was in them." 1 Peter i. 11. But in process of time, the Mosaic law became much corrupted by the traditions of the elders which the scribes had engrafted upon it, and the people became so dependent upon outward observances that they "omitted the weightier matters of the law, judgment, mercy, and faith." Matt. xxiii. 23. Then it became necessary to abolish that law, and Jesus Christ came to "take away the hand-writing of ordinances," and to introduce a more spiritual dispensation, which he exemplified in his life and sealed by his death. This law of the new covenant was predicted by the prophet Jeremiah, who says, "This shall be the covenant that I will make with the house of Israel: After those days, saith the Lord, I will put my law in their inward parts, and write it in their hearts, and will be their God, and they shall be my people." Jer. xxxi. 33. It is far superior to any outward law, because it is always adapted to the condition of each individual, and it is not limited in its application to our outward actions, for it condemns every evil thought which rises in the mind; and thus in the obedient, dedicated soul, it lays the axe to the root of the corrupt tree.

John. I acknowledge all this is consistent with the scriptures; but I have sometimes met with persons who say that all immediate revelation

has ceased, and that we have nothing to depend on now, but the scriptures and our reasoning powers.

Father. Yes, there are such persons, and some of them even pretend to be Christians. But the scripture tells us, "No man can say that Jesus is Lord, but by the Holy Ghost." Cor. xii. 3.

James I have often heard such persons speak on religion,—and I confess that I have so little knowledge on the subject, that I could not refute their reasonings. I should like to be certain that the Divine Spirit does operate upon man, and inform him of his duty, before we proceed further in the consideration of spiritual worship.

Father. The best way, and the only sure way for a man to be satisfied of this, is, to be obedient to every manifestation of duty in his own mind,—to keep all his passions in subjection, and to do every thing that he believes will be pleasing in the sight of God; and he will then find, as he continues to walk in this path, that his spiritual perceptions will improve; and he will see many things to be wrong, which he once considered indifferent, and will experience many joys to spring up in his heart, which before were unknown to him; until at length he may arrive at that state of "full age," which the apostle Paul speaks of, "even of those who by reason of use have their senses exercised to discern both good and evil." Heb. v. 14. That we have a sense of duty, or moral faculty, (by some called conscience) placed in our minds, which when divinely enlightened enables us to discern both good and evil, without waiting for the slow deductions of reason, must be acknowledged by every man that is acquainted with his own heart. This important truth, which is so plainly taught in the sacred writings, and so readily acknowledged by every unprejudiced mind, was long obscured, and even denied, in the false theology of the schoolmen, "who darkened counsel by words without knowledge;"—but it is now acknowledged by the most distinguished writers on moral philosophy; and it has been ably proved, that this "moral sense" is one of the earliest faculties developed in childhood; that it is capable of being improved by use, or impaired by neglect; and that on its use or abuse is dependent the happiness or misery of man.*

James. These facts are acknowledged even by those who deny the authority of the scriptures.

Father. Now, if it be admitted that we have a "moral sense," for discerning between good and evil, it follows as a necessary consequence, that there must be a medium by which this sense is brought into use: for the eye cannot see without light; nor can the ear hear without sound. The Divine Spirit is the medium which conveys

* See Stewart's Moral Philosophy.

to our conscience, or moral sense, the knowledge of spiritual things. It is called the light, because it is the medium of perception. It is called the word of God, because through this medium he speaks to the soul; and it is called the grace of God, because it is given freely, "without money and without price." Jesus refers to the conscience as the eye of the soul, when he says, "If thine eye be single, thy whole body will be full of light: but if thine eye be evil, thy whole body will be full of darkness." There is such a striking analogy between the effects of light upon the natural eye, and the operations of the Divine Spirit in the soul, that I am willing to pursue it further.

The first thing that strikes the attention of an infant is the light; yet it has no knowledge of the nature and properties of light, nor the uses for which it was designed;—it does not even know the distance, nor size, nor quality, of any thing it sees, until its senses are improved by exercise. Persons who were born blind, and have been restored to sight by a surgical operation, have at first to examine and handle every thing they see, like the infant does, until by experience they learn to judge of the size and distance of objects. All their first perceptions are imperfect and indistinct. Like the man who was restored to sight by our Lord, they see "men as trees walking." Yet none of these facts induce us to doubt of the qualities of light being the same in every individual; and even the man whose eyes are impaired by disease, so that he cannot direct his steps aright, must acknowledge, that on other men the light may be shining unimpaired.

It is thus that our mental vision becomes gradually accustomed to the influence of the Divine Spirit "in whom we live, and move, and have our being;" and as we are earnestly engaged in attending to its discoveries, and faithfully concerned to walk in the light, we shall become "children of the light and of the day," and will experience an advancement in the truth, and in the knowledge of the Lord; so that what was at first as "the light of the moon, shall become as the light of the sun, and the light of the sun shall become sevenfold, as the light of seven days;" for "the path of the just is as the shining light, that shineth more and more unto the perfect day."

James. I have long been acquainted, in some measure, with the effect of conscience in restraining me from doing evil, or reproaching me for it; but I had no idea that this was any thing extraordinary.

Father. It is not anything extraordinary, for all men have it; and the Divine light shines on the moral sense of all, but all men do not attend to it; for "men love darkness rather than light because their deeds are evil."

It is acknowledged by all, that man has no

thing good in his own nature, independent of the Divine Being. "There is none good but one,—that is God." Therefore, if we find any thing in our own hearts to condemn us for evil, it must be something that is good,—something that comes from God; for evil will not condemn evil. Satan is not "divided against himself." This pure principle of Divine Light not only condemns us for evil, and "sets our sins in order before us," but it likewise incites us to goodness; and when we are obedient to it, we are sensible of a holy joy, a heavenly serenity of mind, which the apostle Paul describes as the "love of God shed abroad in the heart."

John. I can bear witness to that; for I have experienced it in some measure, and I must acknowledge that it far surpasses all the joys this world can afford.

Father. These truths are admitted by the most pious and enlightened writers of every Christian denomination that I am acquainted with; and many of them have acknowledged, that at times they have been so influenced by Divine grace in their religious services that their words seemed to come to them unsought, and were accompanied with such convincing power and Divine energy, that all opposition was subdued, and many hearts were melted into love and tenderness. Almost every pious and experienced Christian will acknowledge, that he has often known something of this heavenly influence to pervade his mind, during his seasons of private devotion, when he has withdrawn his mind from the world, and prostrated his whole soul in silent adoration before that awful Being whose presence fills infinity, and whose power upholds the universe. Why then should there be so little of this power and this precious solemnity experienced in the religious worship that generally prevails in Christendom? Is it not because men have "forsaken God, the fountain of living water, and have hewn out to themselves cisterns, broken cisterns, that can hold no water?" Instead of waiting for his power to influence their hearts, to control their thoughts, and to enable them to worship in spirit and in truth, how many rush into forms and ceremonies, without waiting for any Divine influence to pervade their minds; forgetful of the apostolic declaration, that "we know not what to pray for as we ought, but the Spirit itself maketh intercession for us with groanings which cannot be uttered; and he that searcheth the heart knoweth what is the mind of the Spirit, because he maketh intercession for the saints according to the will of God." Rom. viii. 26, 27.

(To be continued.)

He who serves the Lord perfectly at the present moment, though it be in a small thing, such as the hewing of wood, or the drawing of water, does in reality glorify Him more than another

who is prospectively athirst and anxious for things of much greater consequence, but at the same time neglects or imperfectly performs his present duties.

THE RISE AND PROGRESS OF THE PEOPLE
CALLED QUAKERS IN IRELAND.

It seemed good to a half year's Meeting assembled in Dublin, in the Third month, 1700, that a faithful narrative should be preserved and transmitted to future generations, of what great things the Lord had done for a people within the compass of forty-five years then past, and not out of the memory of some elders then living. Accordingly such a narrative was by their advice compiled, being collected from divers authentic papers and certificates, from whence the following account was drawn by Thomas Wight, of Cork, a worthy elder, whose character is given in due course of time in the following history.

It is true, William Sewel did, in the year 1722, publish a general history of this people, who (in his own words) "began to take heed to a divine conviction in the conscience, and preached unto others the doctrine of an inward light wherewith Christ had enlightened man, and in the latter end of the time of King Charles I. began to increase in number and became a separate Society among men, distinguished by the scornful appellation of Quakers."

William Edmundson, born at Little Musgrove in Westmoreland, in the year 1627, having received truth in the love of it, and obtained mercy of the Lord to be faithful, was made instrumental for gathering and convincing some (by declaring what God had done for his soul) before any other ministering Friends came out of England in the message of the Gospel, of whom as also of his own inward exercises, trials and sufferings he kept an account in writing, which we shall therefore, in the first place, subjoin in his own words, viz:—

"It pleased the Lord in my youthful days to bring me often to a consideration of my soul's happiness, and when I was in the army in Scotland, under Oliver Cromwell, matters relating to my salvation came more close upon me; for the Lord was visiting me and striving with me both in judgments and mercies. In the year 1651, I came out of Scotland into England, and being in Derbyshire where the name of a people called Quakers was much talked of, and one George Fox to be the ringleader of them; various reports went abroad concerning them, some for good, and many for evil; but my heart was drawn towards them for good.

"Now about this time I married and left the army, and was about to settle in Derbyshire: in the interim my brother, John Edmundson, being then a soldier in Ireland, came over into England to visit his relations, and persuaded me to

go and live in Ireland: my wife being willing, we prepared for it, and taking with us one servant, some necessaries, and merchants' goods, we landed in Dublin, where I was strongly importuned to settle; trading being then very brisk, and houses upon easy terms, it being not long after the plague; but I was prevented by a secret hand that I did not then know, which preserved me from the deceitfulness of riches, with which, if I had given way to this temptation I had according to all probability, been laden as with thick clay, and thereby been hindered from the Lord's service, as some others are.

"So from Dublin we went into the North, and took a house in Antrim, and my brother lived with us, for the troop he belonged to quartered in and about that place: I soon sold off my goods and went for England to buy more, and going into the North, understanding George Fox and James Naylor (of whom I had heard) were come into those parts, I was glad of that opportunity, and went to a place where was James Naylor, who spoke of the things of God's kingdom, and work of regeneration; and though his words were not many, they were powerful, and reached God's witness in me, that had long strove with me, and my heart being then opened, as the Lord opened the heart of Lydia, I knew it to be the truth, and received it in the love of it; for I had longed after it, and was ready for the Lord's harvest: things appeared so plain, and concurred with so many Scriptures, which were brought to my remembrance, that I thought all that heard it declared must needs confess it was the very truth. In a very few days the Lord's power mightily seized on me, and hedged up my former way, and I was under great exercise of spirit on many accounts; so when I had done my business in England I intended by God's permission again for Ireland, bound to Carrickfergus, or near it; and at sea the Lord's hand was heavy on me, and great wrestlings and conflicts of spirit I had; under which exercises I landed at Carrickfergus; it was something late in the afternoon, yet I rode twelve miles to Antrim, where my wife and aforesaid brother were. He meeting me at the door appeared with his usual salutation, but the Lord's power so seized on me that I could not join in it, and I was broken into many tears. We went in, and sat down, and I was mightily exercised under the sense of the Lord's power, which begat in me a true godly sorrow, but mixed with comfort in his tender mercies. My wife and brother sat quiet, with no small admiration at the change; (this was in the year 1653.) Now I came to the entry of my goods which was no small exercise to get through, because at the Custom House an oath would be required, and when they required it of me, I told them I could not swear, for Christ had forbidden it. This was a strange thing to them, not having met with the like before; my deport-

ment, and speech in using the words thee and thou to them, and not putting off my hat was very offensive; but the Lord strengthened me, and my mind was towards him, which enabled me to stand in the cross, and despise the shame, and so according to my small measure I stood in my testimony for his truth, by which I got through that exercise, and received my goods and came home. By this time great discourses were about the Quakers; and I was yet under great exercise of spirit, the Lord's hand being mighty upon me in his judgments, yet, as I said before, mixed with his mercies, and my pain and trouble increased as a woman's in travail bringing forth her first born; and in the night season I wished for morning, and when the morning came, my travel and hard labor ceased not, and then I wished for night again, that my bed might give me ease; thus was I like one tossed, and afflicted in this spiritual warfare, wherein I could find none that could speak a word of comfort, that had trod in this straight path: many professors came to jangle and contend, and spake evil of the way of truth, which added trouble to my wounded heart, and broken spirit, but it wrought for good, for it raised discourses far and near what a people there was, and of their ways, manners, and behaviour; which settled so in the minds of sober people, that it put them upon an inquiry into the principles and faith of them.

"Now was my name much talked of abroad, and one Miles Bousfield, called a Major, who had received some conviction in England by George Fox, came soon away upon it into Ireland, and being about that part of the country I lived in, and hearing of me, and the great exercise of conscience I was in, came to see me, but it happened I was from home: he spoke much of religion, and the work of the inner man to my wife, and how glad he would be of my company, &c. When I came home, my wife informing me of him, and his discourse, I was very glad; for I would have gone far to find an experienced friend that could have informed or helped me in my great straits, for I saw my own poverty, and weakness, and the enemy as a strong man armed making war within and without: so I rode to see Major Bousfield twelve miles, and abode with him all night; he talked much of the work of God in man; spoke well of the way of truth, and of George Fox, and James Naylor, and exhorted me to be cheerful and merry, and not to be cast down with those troubles, for it was the enemy's work to drive me into despair; for I had the tokens of God's love, that he would love me to the end, and nothing in me could hinder his work, &c. I gave attention to his words, being low and dejected in my spirit; his would answer me in that which pleased self; for something in me would have enjoyed the Lord without bearing his righteous judgments, or living in the daily cross of Christ:

and this I found Major Bousfield was a stranger to, but made me easy over God's witness in my conscience, and healed my hurt too fast; for in a few days after I left him, it broke out again, the Lord's hand pursuing me, in whose light I saw and felt something yet in me that withstood the work of God, which must be slain and crucified by the Lord's judgments, and the daily cross of Christ Jesus. Then my wound was opened, and I saw there was no physician but the Lord alone, and I also saw where Bousfield was, and all of that spirit; that they took up their rest and satisfaction in a talk and notion of religion, without the true cross of Christ, that should mortify their lusts, wills, and vile affections, and crucify them to the world, and the world unto them, being at ease in a form of godliness without the real work of the power."

At that time, William Edmundson was removing his habitation from Antrim to Lurgan, and soon after his brother came and dwelt with him, and a meeting was kept at his house in Lurgan, which was the first settled meeting of the people called Quakers in Ireland. This meeting was but small at first, but as their minds were kept inward, waiting in stillness upon God, they felt his presence to comfort and strengthen them in time of great sorrow and weakness, and their number increased; for the name of Friends and fame of truth did spread, and divers sober people that sought after the knowledge of God joined with them, as William Soulden and his wife, John Hendryn, William Lynas, and several others: and the Lord was pleased to give William Edmundson a part in the word and testimony of his kingdom and gospel of salvation, which he labored in according to his measure in much weakness and fear. He was moved to go to the public worship house, belonging to Lurgan, to declare truth in the time of their worship, and was much beaten there by Colonel Stewart, but his testimony reached the hearts of some, particularly Mark Wright and Mark Sawyer, who followed him out of the said worship house and joined with Friends.

(To be continued.)

For Friends' Intelligencer.

Jonathan Clark, the subject of the following memoir, was a member of West Lake Monthly Meeting, Canada West. He was drowned while crossing a ferry a few miles from Pieton, on the evening of the 11th of 10th month, 1835. He was in the 38th year of his age, beloved and esteemed by all who knew him, and his loss deeply lamented, even by those who had but a transient acquaintance with him. "The memory of the just is blessed."

This, our beloved friend, was an example of meekness and piety, fearing God and walking uprightly before Him. He was a living minister of the pure Gospel of Christ, and preached

the word of God freely, and with that power with which he was endued by the allwise Teacher that teaches as never man taught, and who now, as in the days of the apostles, condescends to strengthen the faithful laborers of his vineyard, and in the riches of his mercy waters the thirsty plants, that the branches may bring forth good fruit to the honor of his great and adorable name. How the showers of heavenly dew have flowed through that faithful servant of the Lord, will never by many be forgotten, but is "as bread cast upon the waters, found after many days."

About a year before his death he was moved of the Lord to visit the families of Friends belonging to the Monthly Meeting of which he was a member, which labor he performed with such humility, that the solemnity of his countenance when sitting in silence tended to soften the hearts of those present and prepared them to receive the message of the Lord. He was one that spared no pains to gather the scattered sheep of Christ's flock, that all might come to the true fold of rest, where they may feed in green pastures beside the still waters of life. He was not one who labored to lay up the fleeting treasures of this world, which perish and are gone we know not where, but, on the contrary, labored diligently to lay up treasure in Heaven, where neither moth nor rust doth corrupt nor thieves break through and steal. Although the place of his residence was fifty miles from the Monthly Meeting of which he was a member, he was seldom absent; many times performing much of the journey in the night, when circumstances would not admit of long absence from home. He bore a faithful testimony against using the products of slavery, by example as well as precept.

As the Lord has seen meet in wisdom to try us, by removing as it were a pillar out of his church, may he be pleased in mercy to raise up faithful servants and handmaids, enabling them to go forth into the vineyard and labor for the advancement of his glorious cause in the earth, to the honor of His great and excellent name.

Canada West, 1st Month, 1836.

The following letter, written by him, exhibits his religious concern, as well as humility. E. B.

Dear Sister: I can assure thee that such has been my tried and proved situation for some time past, that I could scarcely claim to be an object of divine regard; yet at times I have been sensibly made to witness the consolation of the living presence of my Lord and Master, so as almost to forget my many trials; and am made to acknowledge that his tender dealings with me have been sanctified to my everlasting good. The trying dispensation which has attended me has been in order that I might see the necessity of living redeemed from the earth and all earthly enjoyments, however near and dear they may be, as I

find many things which my soul delighted in were much nearer to me than I thought them to be. I found it required of me to part with them, at least for a season; but such was the weight of the duty required of me, that when I thought of neglecting it, my very life seemed a burden, and at length, I was enabled to adopt the language of my Lord and Master, "not my will but thine be done," and have in a good degree, as far as I have been faithful and obedient, received the sure reward of all the obedient sons and daughters of God, which is that peace which passeth all understanding, and which cannot be described by those who have not come into the enjoyment of it, by yielding obedience unto God's requiremings, as they are made known in the secret of their souls. And, my beloved sister, I have often groaned for thee in my secret and retired moments that thou mightest come into the full enjoyment of that which I have had a little experience of; believing it is that only which will beautify and adorn us, and make us happy in this life and in that which is to come, which ought to be our first and greatest concern, and which, if we neglect, our loss is irreparable indeed. My beloved sister, often when my mind has been turned toward thee, and in tenderness of spirit has sought after thy welfare, my soul has been clothed in mourning, being then very sensible that thou art putting aside the tender visitations of a merciful God and Saviour, wherewith He is visiting thee in order to gather thee into the fold of eternal rest. I feel desirous that if this still remains to be thy situation, that thou art still waiting for a more convenient season, and a time when it will not be so much of a cross to attend to the calls of Infinite Wisdom, I would revive to thee the language of the sacred record, "I have heard thee in a time accepted, and in the day of salvation have I succored thee; behold, *now* is the accepted time, behold *now* is the day of salvation." For I feel as if thou hadst at seasons entered into solemn covenants with thy God; and through weakness hast broken these precious covenants, and again and again gone counter to the divine commands. O! saith my soul, that thou my dear sister, come to a stand, and consider thy situation, and inquire of thyself how would it fare with my poor soul, if in this state of inattention to his requiremings my God should call me to leave time and enter into eternity! Am I prepared? Is the lamp of the Lord trimmed and burning in my bosom? Have I the oil of faithful dedicated obedience flowing in my vessel, that thereby I am ready to go forth at the midnight cry to meet the bridegroom of souls? Bear with me, dear sister, for great is and has been the exercise of my soul for thy well-being; and if thou shouldst find thou art still unprepared for thy final change, then I beseech thee give not sleep to thine eyes nor slumber to thy eyelids, until thou hast an evidence

that the work is begun that will place thee in a state of acceptance with thy God ; for I long to feel and know this to be thy blessed condition ; for I feel thee to be a sister as to the outward, and I want to feel thee to be a sister nearly and dearly united in the fellowship of the everlasting gospel, that we may be united in a living concern and travail, not only for our own welfare, but also for the welfare of the ever blessed truth. Were we willing to part with our own wills and everything that is near and dear unto us, we should enjoy the living presence of our dear Lord and Master, now, henceforth and forevermore ; which that thou mayst come to know, is the desire of thy brother and tribulated friend and well-wisher in the truth.

JONATHAN CLARK.

2d month, 1853.

THE CHRISTIAN SPIRIT.

Perhaps at no period known was that declaration of Scripture more fully remembered than at the present time : " And when ye shall hear of wars and rumors of wars see that ye be not troubled, for these things must come to pass ; but the end is not yet." The advent of Christ in the flesh was ushered in by angels, saying, " Fear not, for behold I bring you good tidings of great joy, which shall be to all people ; for unto you is born this day, in the city of David, a Saviour which is Christ the Lord ; and suddenly there was with the angel a multitude of the heavenly host, praising God and saying, glory to God in the highest, and on earth *peace, good will toward men ;*" in agreement with the prophecy of Isaiah, " Unto us a child is born, unto us a Son is given, (unto us in all ages,) and he shall be called Wonderful, Counsellor, the Mighty God, the Everlasting Father, and the Prince of Peace, and of the increase of His government and peace there shall be no end ;" and I believe there is that at work which will order and establish it.

The spirit of Christianity is the spirit of peace ; many who profess Christianity know, in their own experience, that " the wolf shall dwell with the lamb, and the leopard shall lie down with the kid, the calf and the young lion and the fatling together, and a little child shall lead them ;" the child born, the Son given—a birth of the Divine life in the souls of men—and it is for all Christians to pray that wonders and signs may be wrought by the holy child Jesus, a Saviour to save us from our sins, *not in them*. When we recognise this Saviour, who is the Saviour of all those that believe ; who came, and still cometh in the flesh, that he may condemn sin in the flesh ; who still says to those who are in rebellion, I am Jesus whom thou persecutest, the Lamb slain from the foundation of the world ; and are brought into that state the Apostle was, when

the light shone about him brighter than the sun, causing him to say, " Lord, what wilt thou have me to do?" then we shall see that if it was wrong for Cain to slay his brother, it is also wrong for us to slay one another.

Believing that all wars come as testified, " even from your lusts that war in your members," these being the source of *all war*, let the potsherd strive with the potsherd of the earth, but let us consider that the Almighty rules and overrules, to bring about the purposes of his own will, and it is for us to have faith in Him, that all things shall work together for good to those who love him, knowing that he can do for us more abundantly than we can either ask or think. This begets in us a firm reliance on His sovereignty, His divine providence, who seeth " with equal eye a hero perish or a sparrow fall," and he will in his own time, and in his own way, be a " Judge among the nations, and rebuke many people, and they shall beat their swords into plowshares, and their spears into pruning hooks ; nation shall not lift up sword against nation, neither shall they learn war any more."

J. W.

Canada West, 4th mo. 27, 1859.

" Set a watch upon thy lips, that thou sin not with thy tongue."

It is always well to avoid saying everything that is improper ; but it is especially so before children. And here parents, as well as others, are often in fault. Children have as many ears as grown persons, and they are generally more attentive to what is said before them. What they hear, they are very apt to repeat ; and as they have no discretion, and not sufficient knowledge of the world to disguise any thing, it is generally found that " children and fools speak the truth." See that boy's eyes glisten while you are speaking of a neighbor, in a language you would not wish to have repeated. He does not fully understand what you mean, but he will remember every word ; and it will be strange if he does not cause you to blush by the repetition.

A gentleman was in the habit of calling at a neighbor's house, and the lady had always expressed to him great pleasure from his calls. One day, just after she had remarked to him, as usual, her happiness from his visit, her little boy entered the room. The gentleman took him on his knee, and asked, Are you not glad to see me, George ? " No, sir," replied the boy. " Why not, my little man ?" he continued. " Because mother don't want you to come," said George. " Indeed ! how do you know that, George ?" Here the mother became crimson, and looked hard at her little son. But he saw nothing, and therefore replied, " Because, she said yesterday, she wished that old bore would not call here again." That was enough. The gentleman's hat was soon in requisition, and he

left with the impression that "great is the truth, and it will prevail."

Another little child looked sharply in the face of a visitor, and being asked what she meant by it, replied, "I wanted to see if you had a drop in your eye; I heard mother say you had frequently."—*N. York Observer.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIFTH MONTH 14, 1859.

MARRIED, at the house of the bride's father, by the approbation of Fishing Creek Monthly Meeting, held at Millville, on the 31st of 3d mo. last, WILLIAM M. REESE, to ANNA EVES, all of the former place.

DIED, after several years of sickness, at her residence in Harford County, Md., on the 12th of 4th mo., 1859, RACHEL KINSEY, relict of the late Seth Kinsey, in the 73d year of her age, a member of Fawn Particular and Deer Creek Monthly Meeting. She bore her sufferings with Christian fortitude, frequently expressing resignation to the Divine will, and thankfulness that she had been called to suffer, since through that medium her spirit had been brought into closer communion with the Father of Spirits. She had become much weaned from the things of this world, often saying to her children they were the only tie that bound her to earth. A friend having remarked that her family would miss her very much, she answered "Yes, but their loss will be my gain." A short time before she expired, having expressed her belief that her end was very near, she said "I do not fear to die." She retained her mental faculties in full vigor to the last, peacefully sinking to rest in the full confidence of a blessed immortality. Her walk in life was in humility, never making an ostentatious display of religion; but when the storms came, and the winds blew, they prevailed not against her, for she was founded on the Rock of Ages.

—, On the 3d of 4th mo. last, Chalkley Eves, son of J. Parvin and Anna Eves, in the 16th year of his age.

—, At Dunning's Creek, on the 27th ult., HIRAM B. CLEAVER, son of Thomas and Ruth M. Cleaver, aged 5 weeks.

—, On the 27th ult., MERCY C., wife of Mark Hains, of Fulton township, Lancaster Co., Pa., in the 50th year of her age.

Her lingering disease, which was pulmonary, she bore with a remarkable degree of patience and resignation, evincing that the Christian's faith was her support, and at last her crowning hope in death. She was an affectionate wife and a careful mother, whose tender counsel expressed to her family, even to the latest hour, manifested her concern for their well-being.

—, At his residence at Branch Hill, Clermont Co., Ohio, on the 29th ult., after a short but painful illness, JOHN WILLIAMSON, in the 67th year of his age.

The deceased was an exemplary member of Cincinnati Monthly Meeting of Friends, and has left a beloved wife and a large circle of friends to mourn their loss, leaving the undoubted evidence of a peaceful and happy close.

On the 6th inst., in the 59th year of his age, ISAAC MECHEM, a member of Little Falls Monthly and Forest Particular Meeting, Harford Co., Md.

HISTORICAL SKETCHES AND REFLECTIONS.

BY S. M. JANNEY.

No. 6.

The progenitor of the Hebrews, first named Abram, and afterwards Abraham, migrated from a country east of the Tigris called "Ur of the Chaldees," and sojourned at Haran, or Charon, in Mesopotamia. It is believed that he there mingled with a people well advanced in civilization, and that he was a man of improved mind as well as deeply imbued with religious sentiments. The Chaldeans were, from an early period, close observers of celestial phenomena; but their astronomical studies were unhappily directed chiefly to the purpose of astrology, or foretelling future events by the aspects of the stars. This chimerical science was also associated with a veneration for the heavenly bodies as the imagined abodes of the deities who governed the world, and hence the worship of the sun, moon and stars was probably the earliest form of idolatry.

From this idolatrous worship Abraham was required by divine command to abstain, and being instructed in the doctrine of the unity and spirituality of the Supreme Being, he was called to leave his home and his country, and to go to a land that God would show him, receiving, at the same time, a promise that he should be the father of a great people, and that in his seed should all the families of the earth be blessed.

Abram, accompanied by his wife Sarai, and his nephew Lot, removed with their flocks and herds and pitched their tents at Sechem, in the land of Canaan and afterwards on a mountain to the east of Bethel. On account of a grievous famine in the land they were induced to remove to Egypt and to sojourn there; for Egypt was then occupied by an industrious agricultural population, and being irrigated by the annual overflowing of the Nile, was less subject to a scarcity of food than the surrounding countries.

Being apprehensive that the Egyptians would become enamored of his wife, who was remarkable for her beauty, and that they would kill him in order to obtain possession of her, he adopted a weak and unjustifiable expedient, pretending that she was his sister, and advising her to participate in the artifice.

According to the Mosaic account, as generally understood, she was his half-sister, but according to Josephus, who doubtless gives the Jewish interpretation of the text, she was his niece, being the sister of Lot, and daughter of Haran. The Egyptian monarch, who by the Hebrews was always called Pharaoh, being misled by the artifice of Abram, made him rich presents on account of Sarai, and took her to his house.

A pestilence soon after broke out in the house of Pharaoh, and the monarch having learned the connection which existed between Abraham and

Sarai, restored her to her husband, reproaching him, at the same time, for his dissimulation.

Abram being dismissed from Egypt, returned to Canaan "very rich in cattle, in silver and in gold."

Lot, who still accompanied him, was also possessed of flocks and herds and tents. There being a strife between the herdsmen of the two relatives, Abram evinced his pacific disposition by saying to Lot, "Let there be no strife, I pray thee, between me and thee, and between my herdsmen and thy herdsmen, for we be brethren. Is not the whole land before thee? Separate thyself, I pray thee, from me; if thou wilt take the left hand, then I will go to the right, or if thou depart to the right hand then I will go to the left." From this we may conclude that the land of Canaan was then very sparsely settled, and perhaps some parts of it divested of inhabitants by the recent famine.

Lot, casting his eyes upon the rich and well watered valley of the Jordan, determined to pitch his tents there in the vicinity of Sodom and Gomorrah. And Abram removed his tent and dwelt in the plains of Mamre, near the ancient city of Hebron.

The cities in the valley of the Jordan had been for twelve years tributary to Chedorlaomer, king of Elam or Elymais, supposed to be situated near the Persian Gulf. In the thirteenth year they rebelled, and the following year they were invaded by the king of Elam, and three other kings from the region of the Euphrates and the Tigris. These confederate kings, called by Josephus the Assyrians, ravaged the country, defeated the troops raised to protect the cities on the Jordan, and carried off many captives, among whom was Lot.

The intelligence of this calamity being brought to Abram, he armed his trained servants, "born in his own house, three hundred and eighteen," and pursued them. He fell upon them by night, and was successful in rescuing his nephew and other captives, some of whom were women. On his return from this successful expedition he was met at a place called the Kings' dale, by the King of Sodom, to whom he delivered up the captives and the spoil, reserving nothing for himself, and evincing by this magnanimous course that he had not drawn the sword to promote his own aggrandizement. At the same place he was met by "Melchisedec, king of Salem, and priest of the Most High God." Concerning this mysterious personage, there has been much conjecture and various opinions.

Some suppose that he was the patriarch Shem, the son of Noah, and progenitor of Abraham; for it appears that Shem was then living, and the place of his residence may have been Salem, the city of peace, afterwards called Jerusalem. The author of the epistle to the Hebrews refers to Melchizedec as a type of Christ, who was to

be a "high priest forever after the order of Melchizedec." As Abram gave him the tenth of the spoils and received his blessing, it is argued that he was greater than Abram, and must have been either his progenitor or a personage more exalted by rank or enlightened by divine wisdom. It has been suggested by an eminent minister of the gospel, now deceased, that the blessing of Melchizedec to Abram consisted in instructing his understanding in the nature of the gospel, which is the power of God unto salvation, and from that time he was a warrior no more.

— And then it was that he occupied the position commemorated by the Holy Jesus: "Your father Abram rejoiced to see my day, and he saw it and was glad.*"

Abram being childless, he and his wife earnestly desired that they might have an heir, to transmit their name and inheritance. His petition was heard by the Most High, who said to him, "Look now toward Heaven and tell the stars, if thou be able to number them; so shall thy seed be. And when the sun was going down, a deep sleep fell upon Abram, and the voice of the Lord came to him, saying, "Know of a surety that thy seed shall be a stranger in a strange land that is not theirs, and shall serve them; and they shall afflict them four hundred years, and also that nation whom they shall serve will I judge; and afterwards they shall come out with great substance. And thou shalt go to thy fathers in peace, in good old age. But in the fourth generation they shall come hither again; for the iniquity of the Ammonites is not yet full."

In a subsequent divine communication the name of Abram was changed to Abraham, which signifies the father of a great multitude.

Abraham had faith in the divine promise, but Sarah, despairing of its fulfilment to her, induced her husband to adopt the eastern custom of taking a secondary wife, or concubine. From this connection with Hagar, an Egyptian woman, sprung Ishmael, the progenitor of the Bedouin Arabs, whose traditions corroborate the Mosaic account, and whose mode of life to this day remarkably illustrates the prophecy concerning his race recorded in Genesis: "He will be a wild man, his hand will be against every man and every man's hand against him."

The most remarkable instance of divine condescension to Abraham was the visit of the angels, to announce the impending doom of Sodom and Gomorrah. As he sat in the door of his tent in the heat of the day, he saw "three men approaching, whom he ran to meet, and bowing himself toward the ground he besought them to abide with him, that a little water might be brought to wash their feet, and a morsel of bread

*Memoirs of Edward Stabler, p. 224.

to comfort their hearts." They halted, and the patriarch, with true eastern hospitality, ran to the herd and fetched a calf, tender and good, which he gave to a young man to dress, and he directed Sarah to hasten and make ready three measures of fine meal to bake cakes upon the hearth. After the repast was finished, the three guests renewed the promise of a son to be born to Sarah, which she heard with a laugh of incredulity, and then they proceeded towards the cities of the plain. Abraham went with them "to bring them on the way," and as they journeyed, one of them disclosed to him the awful retribution that awaited the guilty inhabitants of Sodom and Gomorrah. The affecting appeal of the patriarch that the innocent might not be destroyed with the guilty, was patiently listened to, and it was conceded that even if ten righteous persons were found in a city it should not be destroyed. It appears, however, that so utterly depraved were the inhabitants of those cities, that none of them, except Lot and his family, were saved from destruction.

Two of the heavenly messengers became the guests of the hospitable Lot, and witnessed the revolting immorality of the Sodomites. In order to save him and his family, they urged them to hasten their departure,—to look not behind them,—and to escape to the mountains lest they should be consumed.

The plain, on which the guilty cities were situated, was impregnated or underlaid with bitumen and sulphur, which are still very abundant there, as modern travellers attest. A combustible substance called slime, or bitumen, being dug from pits in the plains was probably used in their buildings, and when by means of lightning the cities were set on fire, they were rapidly consumed. In addition to this the plain must have sunk below its former level, so as to form the lake Asphaltites, or Dead Sea. Many instances have occurred of the sinking of land and the formation of lakes by earthquakes. Even in our own country where such convulsions are rare, there has been one instance in which a considerable tract of land in one of the western States sunk below its former level and is now covered with water.

The destruction of Sodom and Gomorrah with their inhabitants is not more remarkable than the ruin of Pompei and Herculanium, but in the latter case, so far as we are informed, there has been no divine revelation concerning the motives which induced the Ruler of the universe to overwhelm them with sudden destruction.

Lot, with his two daughters, escaped first to a small city, called Zoar, and afterwards to the mountains, but his wife, looking back and lingering by the way, was suffocated by the sulphurous vapors. It has been conjectured by a modern writer of high reputation, that her body was "incrusted with saline particles that floated in the

atmosphere," and that "later tradition, founded on a liberal interpretation of the Mosaic account, pointed to a heap or column of salt, which bore, perhaps, some resemblance to a human form and was believed even by the historian Josephus, who had seen it, to be the pillar into which she was transformed.* The traditions of the country, reported by Strabo, Tacitus and other ancient writers, kept alive the remembrance of that awful catastrophe," by which the cities of the plain were overthrown." "In the account of the latter, the number of the cities destroyed is magnified to thirteen."

In the narrative of the U. S. Expedition to the river Jordan and the Dead Sea, by W. F. Lynch, the author says, in relation to the geographical features of the country. "Everything said in the Bible about the sea and the Jordan, we believe to be fully verified by our observations."

Near the southern end of the lake they saw, in a conspicuous place on the shore, a pillar of rock salt about forty feet high, capped with carbonate of lime, which may be the pillar seen by Josephus, and associated by tradition with the overthrow of the cities and the death of Lot's wife.

The author last quoted thus describes the appearance of the Dead Sea: "It was, indeed, a scene of unmitigated desolation. On one side, rugged and worn, was the salt mountain of Usdom, with its conspicuous pillar, which reminded us at least of the catastrophe of the plain; on the other were the lofty and barren cliffs of Moab, in one of the caves of which the fugitive Lot found shelter. Farther south was an extensive flat, intersected by sluggish drains, with the high hills of Edom semi-girdling the salt plain, where the Israelites repeatedly overthrew their enemies; and to the north was the calm, motionless sea, curtained with a purple mist; while many fathoms deep in the slimy mud beneath it lay embedded the ruins of the ill-fated cities of Sodom and Gomorrah. The glare of light was blinding to the eye, and the atmosphere difficult of respiration. No bird fanned with its wing the attenuated air through which the sun poured its scorching rays upon the mysterious element on which we floated, and which alone, of all the works of its Maker, contains no living thing within it."†

SOMETHING ABOUT CHILDREN.

Children are taught to tease, very much as they are taught to cry. With all his little wants, real or imaginary, the child runs to its mother. They are matters of importance to him. He wants a definite and decisive answer—one which will settle the question—and his mind will be

* Millman's Hist. of Jews, i, 16. Josephus, Book 1, ch. xi.

† Lynch's Expedition, p. 310.

on the rack until he has it. It is not in the nature of the child to feel otherwise. He will have no peace himself, and will therefore give his mother no peace, till he understands and knows that the point is settled, and how it is settled. If you give him no answer till he has spoken ten times, he will speak ten times; and then, if he has any reason to suspect that speaking twenty times more will obtain an answer more favorable to his wishes, he will speak twenty times more. And this will soon grow into a habit. But give him an answer the first time he speaks, and he will not be obliged to speak a second time to obtain one; and never alter a decision for his teasing, and he will soon give it up as of no use. If you have leisure, and the occasion seems a proper one, you may let him argue his case before you decide it—but not afterwards. Indeed, if he has learned by experience that your decisions are final, he will seldom, if ever, attempt it. He will consider an answer as an answer. His mind will be at rest on that point, and soon find something else with which to amuse himself.

TANNER'S LECTURES.

(Continued from page 120.)

The next reference I find to schools, in the Bristol minutes, is in 1676, at which time the Friar's meeting-house had been erected: this minute is as follows: "It being proposed to this meeting, to spare the void room over the meeting-house to Lawrence Steel, for a school-room, this meeting doth, with one accord, give consent that he shall have it for the use proposed." I take the following particulars from the account of Lawrence Steel, related by John Whiting, who speaks of him as one whom he dearly loved, and was well acquainted with. He was born in London, in 1644. His parents, who were zealous Independents, devoted him to the ministry from his birth, and spared no pains in his education. Strong religious convictions led him to seek for help and guidance among the Presbyterians, and after that among the Independents. Although not satisfied to occupy the position of public teacher among them, he accepted a situation in a gentleman's family in Dorsetshire, in which he was expected "to tutor children, and pray and preach in the family." When the time came for him to receive his stipend, he felt that it would be wrong for him to accept payment for his religious services; and shortly afterwards he decided that he could not continue to conduct these stated services. Though he had received a strong prejudice against the newly established Society of Friends, yet his convictions on these points being in accordance with theirs, he was led to make inquiry respecting them. Having parted from his employers with feelings of mutual love and regard he returned to his family. After attending the meetings of Friends for twelve months he spoke as a minister among

them, and he afterwards became eminent in that calling. About three years after leaving his situation in Dorsetshire, he came to Bristol, kept school "in the great meeting-house at the Friars," and was very serviceable in that city and the country adjacent. Being imprisoned in Newgate, for attending one of the meetings in Bristol, his health became impaired by the close confinement, and he died not long after his release, in 1684: "laying down his head in peace with the Lord." John Whiting says further, "He was a preacher of righteousness in that great city, in which he walked as a stranger and pilgrim on the earth; but hath finished his course, and kept the faith, and received the crown of life."

The following mention of another schoolmaster is from a minute made in the fourth month, 1690: "Paul Moone acquaints this meeting that Patrick Logan, a friend, late of Ireland, and now at London, a good scholar, and an apt schoolmaster to instruct youth in Latin, &c., is at present out of employment, and, upon some discourse of it among Friends at London, is in some expectation that he may be serviceable to Friends' children in Bristol, upon consideration of which this meeting is desirous to promote it, in hope it may be serviceable to our youth," &c. In the ninth month following the treasurer was desired to hand Patrick Logan "£50, and to pay Jno. Harwood's note of carpenter's work for the said school." There seems very reason to suppose that this Patrick Logan was the father of James Logan, before mentioned as the Chief Justice of Pennsylvania. Wilson Armistead states that he "was educated for a clergyman, receiving the benefit of a good education in the University of Edinburgh, where he received the degree of Master of Arts. But though educated for the 'Church,' and having served some time as a chaplain, he relinquished his clerical profession, and returned to Ireland, where he afterwards joined in religious Society with the Quakers." In 1694 another schoolmaster had to be chosen, and in a minute on the subject reference is made to a young man aged twenty-two who had been proposed, a good scholar for Greek and Latin, and a good hand in writing; but he was thought too young, Friends "being desirous to have a grave, sober man, his wife a good motherly woman, fit to table, and cherish up lads, and the master able in Latin, writing, and mathematics, if can be had." James Logan, who appears to have succeeded his father in the care of the school, consented to continue it awhile longer.

The next appointment of a schoolmaster took place in 1699 (the year of James Logan's removal to Philadelphia), when Alexander Arscott, who is described as "a scholar lately convinced," was established in the workhouse as master of the school. From the particulars of his life given by Gough,* I find that he was born about 1677.

* History of the Quakers, Vol. IV. p. 307.

His father was a clergyman of the Church of England, incumbent of Southmolton, in Devonshire, and designing his son for the same vocation, he sent him to Oxford to complete his studies. Alexander Arscott seems to have felt, at an early period of his life, that he must relinquish the prospect of worldly advantage which was opened before him by the education which he had received, and by the expectation of preference which his father's connections and influence held out to him. The difficulty which he experienced in adopting this conclusion was greatly increased by the affectionate entreaties with which his parents sought to divert him from it. He wept with them in their distress, and his understanding became clouded for a time by doubts respecting the propriety of his conduct. But during this season of spiritual conflict, he prayed earnestly for right direction; and in answer to his prayers the conviction was brought home to his mind that if he would be Christ's disciple, he must be willing to forsake father and mother at His requirement. He had afterwards the satisfaction of finding his parents more reconciled to the change; and his interest with Friends enabled him to become serviceable to other members of his family, by procuring them situations. Alexander Arscott came to Bristol when he was about twenty-two years of age; and his subsequent course must have convinced Friends that they did well to waive the objection which was expressed in a former case to engaging so young a man. Not only as an instructor of children, but in the work of the ministry to which he received a call; by his zeal for upholding Christian discipline in a Christian spirit; as well as by the means of the sound judgment and diffusive benevolence which gave him a high position among his fellow-citizens in general, he appears to have exerted an influence for good which continued to be felt till the period of his decease. He died in 1737, in the sixty-first year of his age, in a peaceful frame of mind.

Passing into Somersetshire, we find in the Quarterly Meeting minutes of 1697, a reference to an epistle received from Friends in London on the subject of education, &c.: and in the following year Long Sutton having been proposed as a suitable situation for a school, John Banks, Jasper Batt, and Elias Osborne, were desired "to act for the procuring a schoolmaster, and to let him know for encouragement, that if there do not scholars enough come to him to make up £20 per annum, that Friends of this county will make up so much as doth fall short, for two years, so that he may be sure of £20 per annum for two years." At the following Quarterly Meeting it was mentioned that the Friends so appointed "did desist the matter, finding there was an objection did arise in the north division of this county: doubting how the place proposed might agree with their children's health; and

they now proposing Sidcot for the setting up of the school, this meeting consents that it may be there." In the fourth month, 1699, the following minute occurs: "William Jenkins, of Hertford, pursuant to an invitation from Friends of this county, offering himself to this meeting for a schoolmaster, and he being approved of as one fit for that employment, have agreed with him for two years, to commence from the first of sixth month, next. For teaching Greek, Latin, writing and arithmetic, after the rate of 30s. per annum. For teaching reading, writing, and arithmetic, after the rate of 20s. per annum. To reside at *Sithcott*, a very healthy, serene air, about twelve* miles from Bristol, in the road to Exon. Friends of this county to assure him as many scholars as will amount to £30 per annum, for teaching. The £9 per annum is proposed for boarding as many scholars as he shall board." In the following year subscriptions were brought in from the different Monthly Meetings, to defray the outlay incurred in repairing the house at Sidcot, in which the school was established. A later minute contains an offer from William Jenkins, "to teach such children for nothing, as shall be sent to him from the Monthly Meeting's Charity, they paying for their tabling, (and the like for any Friend, in case of inability to give the rates agreed on) for one year next ensuing, if he continues teaching school." The amount charged for boarding the scholars seems to have been thought somewhat extravagant, and a minute of the Middle Division, in 1701, complains of it as being too high, provisions being low in price.† In that year, William Jenkins informed the Quarterly Meeting that he had been presented at the Assizes, for keeping school, and a copy of the presentment was ordered to be sent to the correspondents in London, for their advice in the case. No report is given of the result of this prosecution; but it probably ended in the same way as a similar proceeding against Richard Claridge some years later. Whilst engaged in conducting a school at Tottenham, where he went to reside in 1707, Richard Claridge was cited to appear at Doctors' Commons, "to answer to certain interrogatories concerning his soul's health, and the reformation of his manners, and especially for teaching and instructing boys." A prohibition having been obtained to stay the proceedings, the cause was removed into the Queen's Bench. Chief Justice Holt, who presided on the occasion, gave it as his opinion that the statutes of James the First against Popish recusants, under which the prosecution had been instituted, did not apply to the defendant; and the jury accordingly brought in a verdict in his favor.

* The miles were long in those days.

† In 1728, the charge at David Hall's school, at Skipton, was only £8 per annum, for board and tuition.—*Life of James Gough.*

For Friends' Intelligencer.

Review of the Weather, &c., for FOURTH Month.

	1858.	1859.
Rain, during some portion of the 24 hours,	15 days.	9 days.
Rain, all or nearly all day,	3 " "	3 " "
Snow,	1 " "	2 " "
Cloudy without storms,	5 " "	11 " "
Ordinary clear,	6 " "	5 " "
	30	30

TEMPERATURES, &c.

Mean temperature of the month per Pennsylvania Hospital,	51.80 deg.	50.80 deg.
Highest do. during month do.	81. " "	76. " "
Lowest do. do. do. do.	33. " "	33. " "
Rain during the month,	4:64 in.	5:61 in.

Deaths during the month, counting four current weeks for 1858, and five for 1859,

1858	61
1859	900

The average of the mean temperatures of this month for the past seventy years has been 51.08 deg., while the highest during that period occurred in 1826, '28, '35 and '44—56 deg.; and the lowest in 1794 and 1798—44 deg.

Much more rain has fallen this year so far than is usual, the aggregate for the four months having reached 22.92 inches; 1858, for the same period, 10.60 inches; and 1857 12.93 inches. The comparison might be carried still further back with the same kind of results.

Philada., 5th mo. 7, 1859.

Selected.

WHAT IS A LETTER?

What is a letter? let affection tell;
A tongue that speaks for those that distant dwell;
A silent language utter'd to the eye,
Which envious distance would in vain deny;
A link to bind where circumstances part,
A nerve of feeling stretched from heart to heart,
Formed to convey, like an electric chain,
The mystic flash—the lightning of the brain—
And thrill at once, through each remotest link.
The throb of feeling, by a pen and ink.

THE EVERLASTING ARMS.

Pilgrim on the road to glory,
Pressing toward the heavenly prize,
Mid the ills that now annoy thee,
Mid the dangers that arise;
When thy way is dark and lonely,
Ruffled, filled with loud alarms,
When preplexed, exhausted, weary,
Trust the Everlasting Arms.

When the waves of trouble heighten,
When the billows fiercely foam,
All thou see'st conspires to frighten,
Friends and helpers fail to come;
When of human aid despairing,
And no voice the tempest calms,
Think of this, that underneath thee
Are the Everlasting Arms.

When corroding cares oppress thee,
When the tempter's doubts assail,
When thy inbred foes distress thee,
When they threaten to prevail;
When thou fear'st the thought of yielding,
When thou'd rather die than sin;
When thy hopes seem just expiring,
Everlasting Arms sustain.

And, when all below is closing,
When thou tread'st the swelling flood,
When thou feel'st the waters rising,
Thou shalt find the promise good;
Timid Christian! venture on it,
Bid farewell to all alarms;
'Tis enough, that underneath thee
Are the Everlasting Arms.

JAPAN.

Additional evidence is constantly accumulating that the opening of Japan, accomplished through the agency of Commodore Perry's expedition, will prove more real and of more value in a commercial point of view than was at first supposed. The intercourse between the Japanese and foreign nations assumes every day a more liberal character. Already, by a marked departure from the long-established usages of the empire, European women have been allowed to take up their residence in Japan. The Russian Consul-General at Hakodadi, and also his Secretary, have their wives with them, and at Nagasaki the Dutch commanders who took out the two steamers built in Holland, one for the Emperor, the other for the Prince of Fizen, have been granted a residence, along with their wives. It is a proof of the advance which has been made by the Japanese in European arts, that these steamers, immediately on their arrival, were placed under the exclusive control of Japanese officers and crews.

Another great step toward bringing Japan into community with the Western World is the appointment of Commissioners, under the provisions of the recent treaty, to proceed to the United States. A judicious selection appears to have been made for this purpose. One of the Commissioners is stated to be a man of intelligence, well versed in mathematics and navigation, who, in 1857, conducted from Nagasaki to Yeddo, with the sole aid of Japanese engineers and sailors, the first steamer which came into possession of the Japanese. Both he and his colleague were Commissioners for negotiating the late treaty.

At the last accounts from Hong Kong, the steamer Mississippi had proceeded to Yeddo Bay, for the purpose of taking these Commissioners on board, with their suite of fourteen persons. The steamer was to sail for Panama, by way of the Sandwich Islands and San Francisco, and the Japanese were to be sent over the Isthmus, in charge of Lieut. Habersham. Their arrival here, unless delays should occur in their embarkation, may be expected in the course of a month or six weeks.

The only other embassy ever sent from Japan to any prince of Christendom was one in 1584 to the Pope, during the flourishing period of the Portuguese missions in Japan—not, indeed, by the Emperor, but by three converted princes in the neighborhood of Nagasaki. It consisted of

two young princes scarcely sixteen years old, attended by two counsellors, and conducted by three Jesuit missionaries. They sailed from Nagasaki for Macao, which they reached in seventeen days; but, the season of sailing for Malacca being passed, they were obliged to wait there six months. When at length they did sail, they encountered great perils from storms in a twenty-nine days' passage, and, after recruiting for eight days, sailed again for Goa, then a splendid city, the capital of the Portuguese possessions in the East. In this voyage, they were cast away on the Island of Ceylon, and, though it was in January that they left Macao, it was September before they reached Goa, and nearly a year more elapsed before, by the way of Good Hope, they arrived at Lisbon, whence they proceeded to Rome. The benefit of steam will secure, we trust, to these new Japanese adventurers in the diplomatic line a much shorter and more comfortable passage.—*N. Y. Tribune.*

TIMBER AND ITS DECAY.

The present century has been marked by very active inquiry into the nature of wood, the structure of its fibres and cells, the derangements to which the fibres are subject, the effect of these derangements on carpentry and ship building, and the best mode of removing the evil. There have been many curious facts ascertained concerning the qualities of different kinds of timber, and especially in relation to its decay. The explanation of dry rot may be stated as follows: all the trees contain within their pores a kind of albumen, which contributes to the sustenance of the growth; but when the tree is felled, and the trunk and branches converted into timber, this albumen becomes an evil, instead of a good. When the albumen is moist—which it always is before the timber is seasoned—it has a tendency to enter into a sort of fermentation; if this state commences, the albumen becomes a favorite relish for certain minute animals, who forthwith bore for themselves invisible passages through the wood, to attain the object of their search; these passages admit air and moisture, which so act upon the chemical constitution of the sap as to afford a kind of soil in which minute parasitical plants grow; these plants, sprouting out, force holes for themselves through the wood, and appear on the surface as dry rot. Attempts innumerable have been made to find out some chemical mode of protecting timber from ruinous decay. Sulphate of iron has been recommended, also sulphate of copper, as a steep preservative of wood. Col. Congreve proposed the adoption of a coating of oil of tar, afterwards, a mode was brought forward of extracting the air from the pores of wood, and forcing chemical agents into the pores thus vacated, then came a multitude of proposals respecting the substance to be employed,

coarse whale oil, oil of birch bark, unslaked lime, pyroligneous acid, etc. But the albumen cannot be driven out; and if dried it has a tendency again to absorb moisture. Hence, chemists have recommended, and practical men have adopted, modes of rendering the albumen insoluble, by combining it chemically with some other substance; being made insoluble, it defies moisture.

VALUE OF CHARCOAL TO MAN AND BEAST.

One of the most simple and excellent medicines for any derangement of the stomach of human beings, is finely pulverized, fresh burnt charcoal. For this purpose it should be closely corked up in a bottle as soon as it has been burnt and ground; a teaspoonful taken in a wine glass of water once a day will frequently be found worth more than all the quack nostrums with which the country is flooded.

But our object was to speak of the value of charcoal to domestic animals in fattening them. A half pint of it finely pulverized and mixed with corn meal and water to each animal once or twice a week, will be found extremely beneficial in aiding digestion and preventing any derangement of the stomach arising from overfeeding, as is liable to be the case with that hoggish animal. Besides serving as a medicine, it is also extremely fattening, either in itself or rendering the food eaten more available by correcting and stimulating the digestive powers.

Charcoal has also been known to work wonders in fattening poultry, geese, ducks, &c. It may be given in the same way as recommended for swine. Fowls that have accidentally been confined for a long time where they had access to no food except charcoal, when discovered, were found not only to have sustained themselves but to have actually fattened.—*Valley Farmer.*

From the London Daily News.

DEATH OF THE SLAVE-HUNTING KING.

We have this morning to announce the death of a sovereign. A black, woolly-headed potentate was he, it is true, but nevertheless a notable Monarch—a trained and experienced warrior—a King whose deeds resounded far and wide. It is the demise of Gezo, the Slave-King of Dahomey, that we record. The exact date when the event occurred is not given in the letter before us, but the news is brought with such particulars, by the last mail from the West Coast of Africa, that no doubt can be entertained that Gezo is gathered to his fathers, and that his son reigns in his stead.

Gezo deserved the odium and detestation which he so abundantly obtained; all the more that he was both able and sagacious. For upwards of five-and-twenty years he supplied the demands of the Spanish and Portuguese slave-dealers who infested the Bight of Benin; ravaging and de-

vastating the interior far and wide by his slave-hunts to obtain victims for his European customers. He organized and led these forays and cruelties on the largest scale Africa has known, and annually sold without remorse or scruple his own countrymen in tens of thousands for exportation. His horrible cruelties arrested the progress of Africa, fed the wretchedness and mortality of the middle passage, and, by depopulating Negroland, promoted the immense material prosperity of Cuba and Brazil. His policy, and the wealth he derived from it, excited the cupidity of his neighbors, and from Whydah to Lagos the slave trade became the business of the whole population. When Gezo succeeded to his patrimonial throne, the adjacent country was inhabited by independent communities, of the Egbas, and it was on them he perpetrated his earlier atrocities. He attacked them, burned their towns, carried off their choicest people, and, when his own violence was unsuccessful, his intrigue introduced civil war, which completed their ruin.

While, however, the interior without the limits of Dahomey suffered by these slave wars, disorganization and anarchy, the towns on the coast for a season flourished. Whydah, Porto Novo, Badagry and Lagos rose in population, carried on a great commerce in human flesh, were the seats of large establishments, and grew rapidly in wealth. But their ill-gotten riches and fictitious prosperity brought their own ruin; they were nests and dens of robbers, thieves and pirates; scenes of tumult, disorder and violence were of constant occurrence. Badagry, which boasted of 10,000 inhabitants, was burnt down in a cut-throat affair amongst its own lawless population; the whole Bight was closely blockaded by English cruisers; and Lagos was destroyed by a British bombardment. The liberated Africans of Sierra Leone founded the town of Abeokuta, established in the interior an anti-slave trade interest, were encouraged by English missionaries, and supported by English assistance. This brought on Abeokuta the wrath of Gezo; again and again he attacked the new community; as often his assaults and sieges were repulsed; until at last, in 1851, the Slave-King was completely routed under its mud walls, and from that time his power declined. British policy prevailed on the coast; Lagos, under the influence of our Consuls, Beecroft and Campbell (both remarkable men), became the seat of a large and profitable lawful commerce; roads were opened up into the interior; peace being established, industry took to honest courses, and from Whydah to Lagos the commerce in palm oil superseded the slave trade and increased at a rate nothing less than marvellous; and then Gezo sought, however grimly, to regain his diminished revenues by participating in it.

Gezo was, however, never converted or reconciled to legitimate commerce; he repulsed all

our diplomatic advances, rejected an anti-slave treaty, denounced our cruising system, complained that we had deprived him of his revenues, and was ever on the alert to revive the traffic.

At last his dismal reign is over; and his death has been mourned and his funeral celebrated by the entire slave trade interest of the coast and the interior. His obsequies were performed at Abomi; all the slave-traders of Whydah attended and assisted at them; each carried thither his contribution of slaves to be sacrificed to his memory, and of merchandise to be presented to his successor. It had been proposed to facilitate Gezo's admission into the other world by the slaughter of 2,000 Africans, but, whether from the difficulty of procuring that number or from their greatly increased value to the Spaniards, the massacre was happily limited to 800. Gezo's European agent at Whydah as usual displayed his magnificence on the occasion. He offered to the new sovereign a large silver salver filled with bright new dollars, and he provided for the enjoyment of his old master, in the Paradise whither he is supposed to have betaken himself, the model of an oak tree in frosted silver, from the branches of which hung, for his use, when disposed to the fragrant weed, the choicest of Havana segars. The mournful and terrible ceremonies over, the new King proclaimed his policy to be that of his father; report adds that he at once left Abomi at the head of a large army on a slave-hunting expedition.

I find all sorts of people agree, whatsoever were their animosities, when huddled by the approaches of death; then they forgive, then pray for, and love one another: which shows us, that it is not our reason, but our passion, that makes and holds up the feuds that reign among men in their health and fullness. They, therefore, that live nearest to that state in which they should die, must certainly live the best.

Love is the hardest lesson in Christianity; but for that reason, it should be most our care to learn it.—*Penn.*

ITEMS OF NEWS.

THE EUROPEAN WAR.—Europe is palpably on the very eve of a great war. The Niagara, reports that on the 20th ult., Austria addressed to Piedmont an ultimatum to whose demands an affirmative answer was required by the 24th. These demands are that Piedmont shall immediately disarm, and especially shall dismiss the volunteers who have been gathering to her standard in considerable numbers from all parts of Italy within the last two months. If these conditions are not complied with in the time specified, Austria will at once declare war; and this menace is supported by the movement of a force of 80,000 men upon the Piedmontese frontier, in addition, it is said, to those already collected there. This army is of course intended for the immediate invasion of Piedmont, and will proceed to cross the line the instant war is formally proclaimed.

FAILURE OF THE AFRICAN GROUND-NUT CROP.—Late advices from the ground-nut districts on the Coast of Africa informs us of a great deficiency in the yield of this crop in Goree and Senegal, and at Gambia it is supposed the crop will not exceed 8,000 tuns, or 600,000 bushels, against 14,000 tuns, or 1,050,000 bushels last year. Prices on the coast had advanced considerably in consequence.

INDIANS.—Dr. Forney, Superintendent of Indian Affairs in Utah, is busy visiting the several tribes within the jurisdiction, in order to counteract the evil influence of those white men who were endeavoring to incite them to hostilities, and to lay the foundation for their being gathered on Government reservations and taught the arts of civilized life.

CANALS.—The number of miles of canals in the United States now in use is about 50,088; the total cost is about \$175,000,000. In the three States of Vermont, New Hampshire and Massachusetts, there are not ten miles of canals now used for purposes of navigation. In New York and Pennsylvania, canals perform most important functions, both in the local and general trade of those States.

SLAVERY.—The *Journal of Commerce* has information that a cargo of 600 slaves was landed at the mouth of the Mississippi about fifteen months ago, unknown to the United States authorities.

HAYTI.—A missionary from Hayti is in New York at present. M. D. Bird, who for twenty years has resided in Hayti, as a Wesleyan missionary, preached in the Shiloh African Presbyterian Church on 1st of this month. He spoke very encouragingly of the condition and prospects of the Haytian people, and reminded his hearers that it is not more than fifty years since Hayti emerged from a state worse than that of barbarism, and that in that short time she has made wonderful progress. Her revolutions are but proofs of the intelligence of the people and their constant desire for a better state of government. Mr. Bird had personally known President Geffard for a number of years, and believed him to be an honest, upright magistrate, and a truly Christian man, who was devoted to the welfare of the country over whose Government he presided.

The republic of Hayti has commissioned two colored men, Touissant and Merdon, as ministers to London, where they have been received officially.

During the sitting of the Court of Oyer and Terminer of Kent Co., Delaware, Elijah Prattis, (colored) was sentenced on the 2nd inst., to pay a fine of five hundred dollars, and to be sold to the highest bidder, for the term of seven years; to leave the State, never to return; and to pay the costs of prosecution in this case. And what for? Because, he was convicted, during the present sitting of the Court, of aiding a slave to escape named Albert Calvin Jackson, said slave being aged *eighteen months*, and claimed as the property of James R. Lofland, late Secretary of State for the State of Delaware. The sentence will be enforced on the 14th inst., and a free man thus reduced to a life of slavery on a Southern Plantation for fulfilling the command to "love one another."

He has property, a wife and eight children; but all must be offered up on the altar of American Slavery.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is inactive, and prices are firmer. We quote sales of superfine Flour at \$6 70 a 6 75, and \$7 25 a 8 25 for extra family. The sales to retailers and bakers are within the range of the same figures. Sales of Rye Flour

and Corn Meal continue limited. The former at \$4 25 a 4 50 per bbl. Sales of Pennsylvanian Corn Meal at \$3 88.

GRAIN.—The receipts of Wheat are light, with fair demand. Sales of Southern and Pennsylvania at \$1 69 a 1 70 per bushel for fair and prime red, and \$1 80 a 1 85 for white in store. Rye is in demand, and sells at 90 cents. Corn is in demand; sales of yellow at 91 a 92 cents. Oats are in good request; sales of prime Pennsylvania at 57 a 58 cents, and of Southern at 56 cents.

The season for Cloverseed is over; we quote at \$4 75 a 5 25 per 64 lbs. Nothing doing in Timothy or Flaxseed.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,

Cheap School Book Depository, 1336 Chestnut st.

HIGHLAND DALE.—Charles and Catharine Foulce inform their friends that their house will be open for the reception of boarders, early in the 6th month. It is an elevated situation, one mile from Stroudsburg, and four miles from the Delaware Water Gap.

The cars leave Walnut Street wharf every morning for Stroudsburg.

The price of board in 6th and 7th months, will be \$6 per week, and in the 8th month, \$7 per week. Children under 12 years, half price.

4th month, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next session of this Institution, on the 2d of 5th mo. next. For reference and further particulars, enquire for circulars of Principal,

BENJAMIN SWAYNE.

London Grove, 22d of 3d mo., 1859.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON, } Assistants.

MAGGIE B. JACKSON, }

Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER, } Proprietors.

SUSANNA G. CHANDLER, }

3d mo. 19, 1859.—10 t.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIFTH MONTH 21, 1859.

No. 10.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

(Continued from page 131.)

On Divine Worship.

John. But it will not be safe, from this, to conclude that all vocal utterance of prayer or praise is inconsistent with true spiritual worship; for Christ himself prayed with his disciples, and gave them a form of prayer at their request. It is also said, that they sang a hymn after eating the passover.

Father. I would by no means restrict divine worship to entire silence; for it does not consist in outward silence alone, any more than it does in words. The apostle Paul says, "I will pray with the spirit and with the understanding also: I will sing with the spirit and with the understanding also." 1 Cor. xiv. 15. From this, it is evident he thought the understanding alone was not sufficient without the aid of "the spirit" of divine grace, to dictate prayer or praise to God. In his epistle to the Ephesians, he tells them to "take the helmet of salvation, and the sword of the Spirit, which is the word of God; praying always with all prayer and supplication, in the spirit, and watching thereunto, with all perseverance, and supplication for all saints." In nearly all the instructions of the blessed Jesus and his apostles respecting prayer, the duty of watching is carefully enjoined; for the hearts even of the faithful, are not always in a state suited to pray or sing praises to God. It is the duty of all to watch thereunto, as the "sick and the impotent folk" waited at the pool of Bethesda, until "an angel came down and troubled the water," and then "they stepped in," and "were healed of whatsoever disease they had." John v. 4.

"Watch and pray," said Jesus, "for ye know not the hour when the Son of man cometh." "Blessed are those servants whom the Lord, when he cometh, shall find watching: verily, I say unto you, that he shall gird himself, and make them to sit down to meat, and will come forth and serve them." Luke xii. 37.

As to the hymn which they sang after eating the passover, I have no doubt it was dictated by the "power and wisdom of God," which dwelt in Jesus; for he told them on several occasions, "Whosoever I speak, even as the Father said unto me so I speak." "I can of mine own self do nothing; as I hear I judge." Therefore a hymn, dictated and sung under this Divine influence, must have been highly edifying. When he promised his disciples that the "Comforter, which is the Spirit of Truth," should come and teach them all things, he certainly did not intend to limit its operations by confining them to a set form of prayer or praise.

The prayer known by the name of the Lord's prayer, was also dictated by the same Divine wisdom, and was exactly adapted to the occasion on which it was given; but it does not follow that it will suit all occasions; for we have no account of its being used afterwards by the apostles, although their praying is often mentioned.

"The Lord's prayer is remarkably short, and yet very comprehensive; and it appears to have been designed to show his disciples, that they must not be like the heathen, who thought "to be heard for their much speaking." His parable of the publican who smote his breast, and said, "God be merciful to me a sinner," and came down justified rather than the Pharisee, who made a long profession, was also intended to show, that it is not the formal hypocrite, but the humble, contrite heart, which is acceptable in the Divine sight. God looks at the heart; the form of prayer or praise is nothing in his sight; but the influence under which it is performed is every thing. Our Lord says, "Your Father knoweth what things ye have need of before ye ask him." He knows what will be good for us better than we do ourselves; and if we set about asking him for whatever we may deem right in our own eyes, we shall often "ask amiss," and then it will be an evidence of his mercy not to grant it.

James. What is the use of praying, then?

Father. The object of prayer is not to change the Divine purposes, but to conform our wills to

his. His will and his purposes are always the same and always right; for in him is neither variability nor shadow of turning. One object of religious worship is, to seek for light from him to know our own states and conditions; and when we are thus brought to see what we stand in need of, he gives us ability to ask it; he extends to us his holy sceptre, and grants the prayer that is made according to his will. This is the prayer of faith that is always availing, whether it be uttered vocally, or only breathed in the secret of the soul. The man whose heart is devoted to God will be always "watching unto prayer," and may therefore be said to "pray without ceasing," for he will be often engaged in mental supplication, or in songs of praise, "making melody in his heart unto the Lord." Nor will his prayers be confined to supplications for his own soul. As all the members of the true church are one in spirit, being baptized by one spirit into one body, and thereby made to sympathize one with another; so each member will be at times dipped into a feeling of near unity with the brethren, and may feel himself constrained, by the influence of Divine love, to offer up a petition on their behalf, either vocal or mental, which will be acceptable in the Divine sight; and being accompanied by the influence of his Holy Spirit, cannot fail to do good. He who prays, preaches, or sings, without this influence, is like one who shoots his arrows at a venture, and, unless his rashness be overruled by Divine Providence, he is more likely to do harm than good. But even when we think ourselves clothed with ability for religious services, it is well to remember the caution of the royal preacher, "Keep thy foot when thou goest to the house of God, and be more ready to hear than to give the sacrifice of fools: for they consider not that they do evil. Be not rash with thy mouth, and let not thy heart be hasty to utter any thing before God: for God is in heaven and thou upon earth; therefore let thy words be few. Ecc. v. 1, 2.

John. Does not our Lord promise that "whatsoever ye shall ask in my name, that will I do?"

Father. Yes; there is such a promise frequently repeated; but we are not to understand that merely taking the name of Jesus Christ into our mouths, will insure acceptance to our prayers; for the wicked can do this as readily as the righteous, and even those who are comparatively good may do it improperly. The name of the Lord is often used in the scriptures to signify the power, spirit, or presence of the Lord. Thus, when he promised to send his angel to go before the Israelites to keep them in the way, he told them "Beware of him and obey his voice, provoke him not; for he will not pardon your transgressions, for my name is in him." Ex. xxiii. 21. "In all their afflictions he was afflicted, and the angel of his presence saved them; in his love and in his pity

he redeemed them, and he bare them and carried them all the days of old." Is. xiii. 9. The prophet Jeremiah, in speaking of the coming of Christ, says, "This is his name whereby he shall be called, the Lord our Righteousness." And it is also said, "They shall call his name Emanuel, which, being interpreted, is God with us." Mat. i. 23.

The name Jesus (a saviour) and Christ (anointed,) was given to him, because in him dwelt a full manifestation of the power and "wisdom of God," who is the only Saviour; for he says by the mouth of the prophets, "I, even I, am the Lord, and besides me there is no Saviour." Isa. xli. 3 and 11. Hosea xiii. 4. Now if this name is intended to signify the power, spirit, or presence of God, do not those who invoke the name without feeling the power, take the name of the Lord in vain? They who pray under the influence and direction of this holy name or power, will ask for nothing inconsistent with the Divine will, and therefore their prayers will be always availing.

John. But are we not required to pray for all men? and yet we believe that all men are not saved, for many continue to live in wickedness.

Father. God has no pleasure at all "that the wicked should die, but that he should return from his ways and live." Ezek. xviii. 23. He furnishes every man with the means of salvation; for "the grace of God, which bringeth salvation, hath appeared to all men." He who loves God, will love all God's creation; and this feeling of universal love will be found to arise in mental supplication for all men, that they may come to the knowledge of the same blessed truth: and sometimes these aspirations will become so earnest as to give rise to the utterance of vocal prayer, which may, under the divine blessing, produce in others the same kind of feelings. But these precious feelings may spread from heart to heart, and rise into dominion, without the use of words; for there is in divine love a sympathetic influence, which pervades the minds of those who worship aright; and when they are assembled together in worship, it brings them into the "unity of the spirit, in the bond of peace," and they seem to live and breathe in an atmosphere of love. This holy influence may be felt in such a degree as to surpass the power of utterance; for human language has no terms by which to convey it to others, and it can only be conveyed in that "language in which we were born," which is the language of impressions made upon the heart by the finger of God. The same kind of holy solemnity is described in the Revelations, as the highest degree of religious worship; for, after the opening of the sixth seal, the apostle "saw a great multitude which no man could number, of all nations, and kindreds, and people, and tongues, who stood before the throne and before the Lamb, clothed with white robes and palms in their hands, and cried with a loud voice, saying, Salvation to our

God which sitteth upon the throne, and unto the Lamb." But when the seventh and last seal was opened, every tongue was mute—every soul was prostrate in the presence of the living God, and there was "silence in heaven about the space of half an hour." Rev. viii. 1. This state of mental silence, in which the active powers of man are all at rest and waiting upon God, was also prefigured in the institution of the Jewish, or Seventh-day Sabbath, which the apostle Paul expressly says, was "a shadow of things to come." Col. ii. 17. And, in another place, after speaking of the Seventh-day, he says, "There remaineth therefore a rest to the people of God;" for he that hath entered into his rest, hath ceased from his own works as God did from his. Let us labor therefore to enter into that rest. Hebrews iv. 9—11.

They who have ceased from their own works, from the "will-worship and voluntary humility" of the natural man, are then prepared to enter into the closet of the heart, and shutting the door upon the world, to offer up their prayers in secret to the Father of spirits; and "he who seeth in secret, will reward them openly," by granting them ability to overcome every temptation that may assail them.

James. This doctrine would seem to exclude from public worship, not only instrumental music, but even the singing of hymns. Yet it appears to me, that there are directions somewhere in the New Testament for singing hymns and spiritual songs.

Father. Instrumental music is entirely without example or precept in the New Testament; and there is good reason to believe it never was used among Christians until the church became corrupted. It was much used in the worship of the Israelites under the old law, and was well suited to an outward, shadowy dispensation, when the Deity, in condescension to the ignorance and weakness of the people, was pleased to manifest himself in an outward temple, made with hands. But we live under a spiritual dispensation, and are taught to believe, that "the Lord of heaven and earth dwelleth not in temples made with hands, neither is worshipped with men's hands, as though he needed any thing; seeing that he giveth to all life, and breath, and all things; that they should seek the Lord, if haply they might feel after him and find him; though he is not far from any one of us, for in him we live, and move, and have our being." Acts xvii. 24—28.

Music may have a tendency to allay the passions, and to quell for a moment the unsanctified desires of the human heart; but its influence is only temporary; for no sooner have its sounds ceased to vibrate on the ear, than the appetites and passions awake from their slumbers with unabated strength. Even the melody of David's harp, could only soothe for a while the evil spirit

of Saul—it had no influence in changing his heart. The object of Christ's reign is not to send peace on earth, by soothing the passions of men, but a sword, to subdue them and bring them under right government. He comes to slay, that he may make alive again; to subjugate the will of man, in order that his divine will may be done in us, and to bring all our faculties, desires, and affections, under the government of his Holy Spirit. The pomp of ceremonies, the splendor of decorations, and the "pealing anthems" of the organ, are not consistent with the simplicity of spiritual worship, nor with the character and precepts of the meek and lowly Jesus.

It appears that the primitive Christians did sometimes sing psalms or spiritual songs, but the scriptures do not inform us whether it was always a part of their public worship, nor do they mention whether more than one person at a time was engaged in the service. It seems, from some expressions of the apostle Paul, that their mode of worship in the church of Corinth was different from any that now prevails in Christendom. He says, "When you come together, every one of you hath a psalm, hath a doctrine, hath a tongue, hath a revelation, hath an interpretation. Let all things be done unto edifying. If any man speak in an unknown tongue, let it be by two, or at most by three, and that by course, and let another interpret. But if there be no interpreter, let him keep silence in the church, and let him speak to himself and to God. Let the prophets speak two or three, and let the others judge. If anything be revealed to another that sitteth by, let the first hold his peace; for ye may all prophesy one by one, that all may hear, and all may be comforted." 1 Cor. xiv. 26—31.

He also mentions singing, in two other of his epistles. He says, "Be not drunk with wine, wherein is excess, but be filled with the spirit, speaking to yourselves in psalms, and hymns, and spiritual songs, making melody in your hearts unto the Lord." Eph. v. 18, 19. Again he says, "Let the word of Christ dwell in you richly in all wisdom; teaching and admonishing one another in psalms, and hymns, and spiritual songs; singing with grace in your hearts to the Lord." Col. iii. 16. In these passages it is observable that he is careful to mention that they must be filled with the spirit or word of Christ; and I think there is no doubt that their songs of praise and thanksgiving were dictated by it, just as much as their praying and prophesying. Every act of worship that proceeds from the influence of the Holy Spirit, is spiritual worship; and every act that proceeds from the will and wisdom of man, is "will worship;" the former is enjoined upon us; but the latter is expressly forbidden. Col. ii. 23.

We are recommended in the scriptures not to neglect the assembling of ourselves together; and Christ has declared, "Where two or three

are gathered together in my name, there am I in the midst of them." He also says, "Without me ye can do nothing." Now, does it not follow that when we are assembled together, we must wait in silence until we feel his power and presence to direct and assist us? For "obedience is better than sacrifice, and to hearken than the fat of rams." They who act upon any other principle than this, appear to me to be like those who urged Jesus to go up to the feast: but he replied, "My time is not yet come: your time is always ready. The world cannot hate you, but me it hateth, because I testify of it that the works thereof are evil." John vii. 6, 7.

[To be concluded.]

RISE AND PROGRESS OF THE PEOPLE CALLED QUAKERS.

(Continued from page 133.)

The next Friend that came out of England was John Tiffin, who came and sat with the above mentioned Friends in their meeting, and did sometimes speak a few comfortable and edifying words among them. William Edmundson and he travelled together to several places and had good service for truth, and discoursed and had disputes with professors, and many began to listen to them and inquire into their faith and principles, and truth began to spread, though through great opposition; for now the priests and people began to be alarmed and in a rage, and Friends were exposed to great sufferings upon several obvious accounts, particularly, as the testimony of truth was against all hireling teachers and their forced maintenance; these made it their business to incense the magistrates and rulers against Friends as holding damnable doctrines, led away with the delusions of Satan, &c., and their conscientious scrupling to swear, in obedience to Christ's command, "Swear not at all," was a strange thing to the people, as was also the use of the plain and proper speech of thou and thee to a single person, and refusing to take off their hats, as being a testimony of honor and respect due to Almighty God only; and few could suffer these things, but frequently on these accounts treated them with abusive words, and sometimes with blows or throwing stones.* The keeping to one price in selling of goods and to the first demand without abatement, was also a great stumbling block to most, and made them

* These practices of theirs were not the result of humor, or of a framed design to declare or recommend schism or novelty, or to distinguish themselves as a party from others; but God having given them a sight of themselves, they saw the whole world in the same glass of truth, and sensibly discerned the affections and passions of men, and the rise and tendency of things." See Penn's "Rise and Progress of the people called Quakers." And in a treatise of the same author, entitled "No Cross, no Crown," these matters are discussed at large, and particularly the true honor excellently distinguished from the vain and worldly.

decline dealing with them for some time, until they saw into the justice* thereof. But to return to John Tiffin.

He and William Edmundson went to Belfast, (a town of great profession) where there was but one of all the inns and public houses that would lodge them; here John Tiffin lodged, and often endeavored to get an entrance for truth in that town, but they resisted, shutting their ears, doors and hearts against the publishers thereof † Near this town there dwelt one Laythes, who promised to let them have a meeting at his house, but through some slavish fear failed of his promise and disappointed them; yet this did not hinder them, viz.: John Tiffin, William Edmundson, &c, from holding a meeting in the open air; for there being a little way from the said Laythes' house three lanes' ends that met, they sat down and kept their meeting there, and were a wonder to the people who came about them; and something was spoken to direct their minds to God's spirit in their own hearts. These exercises, though in much weakness and fear, spread the name and fame of truth, and occasioned many honest people to inquire after it, and some were added to the meeting at Lurgan. ‡ John Tiffin having spent five or six weeks with Friends, returned for England.

Thus at the beginning was the way straight and difficult, but yet truth gained ground and prevailed, and the number of Friends increased, and they had a godly care over their words and actions, that they might give no occasion to the adversaries of truth, who were many; but as Friends kept low in the fear of the Lord, they were preserved, and God's witness in the people was reached; of which it may not be impertinent to mention one instance, viz. John Shaw, of Broad-Oak, near Lisnegarvy, (who with his family were convinced about this time) often said that William Edmundson's words and deportment were a means to convince him of the truth.

The next Friend that came out of England in the Ministry was Richard Clayton, who came to William Edmundson's house, by the Lord's direction, as he said; so he and William Edmundson travelled together on foot in the Lord's service, (for then it was not easy for travellers to ride, or get lodging at inns, the people, being prejudiced against Friends by the instigations of the priests, throwing stones and dirt at them as they passed along;) they went through several towns and villages to Coleraine, and there published the truth in their streets, and put a paper upon their worship-house door, for the inhabitants would not receive them, nor let them lodge in the town, but banished them out of it, so they lodged at a cabin in the mountains, and next day they went to Londonderry, where one Evans hospitably received and entertained them; they had two meetings there, and he and his wife and

† Edmundson's Journal, sec. 2. ‡ Ibid. sect. 3. § Ibid.

two sons and one daughter were convinced of the truth: the governor was at both meetings, and he and several others acknowledged the truth declared by them, showing themselves kind and affectionate. From thence they travelled to Strabane and Newtown-stewart, Omagh, Dunganon and Charlemont, and to the house of Margery Atkinson (near Killmore, where William Edmundson had been once before,) a widow and a worthy woman, who received the truth with gladness, and lived and died in the Lord, and her memorial is blest. They had a meeting at her house upon the first day of the week, at which meeting Richard Clayton was very serviceable, and several tender people received the truth at that time in the love of it. Now the truth began more to spread and its friends increased, and they had meetings in several places. Not long after this, a meeting was settled at the Grange below Antrim, at the house of Gabriel Clark, an honest, religious, ancient man, who received truth, as also his wife and family. Another meeting was also held at Toberhead, at the house of Archibald Scott, who also received truth, (a religious, honest-hearted man,) and people more and more were convinced, insomuch that the priests and professors still raged, many tender people leaving them; and to revenge themselves they cast William Edmundson into prison in Ardماغh, the county-goal not being repaired after the war: he was put into a little room in the goaler's house, where although he was weak in his own eyes, the Lord was his strength, and his power comforted him, and he was made a terror to the goaler and wife, although he said nothing.

This year James Lancaster and John Tiffin came over from England, in the ministry a second time: they landed in the north, and being at meeting on the green in Lurgan near the market place, many rude persons came thither, and beat the said two Friends and William Edmundson very sorely, and drove them to the town's end, thinking to drive them out of it, but the more sober sort of people rose up against them and prevented it.

In the beginning of this year also came over, and landed in Dublin, Elizabeth Fletcher and Elizabeth Smith, who having the testimony of truth to declare, published the same both at the public worship-house called St. Audeon's, and at a meeting of the Baptists; for the first they were committed by order of Richard Tigh, Lord Mayor of the city, to Newgate prison, and the Baptists rejected the testimony of truth. After they were released from Newgate, they had a meeting at the chamber of Richard Fowkes, a tailor, near Polegate, which was the first meeting that can be remembered to have been kept in Dublin, and the first settled meeting was at George Latham's near Polegate. Their service was also great in the southern parts, particularly at Youghall, where divers were convinced by

their ministry, viz.: Captain James Sicklemore, Robert Sandham and several others, and the same two women were the first of the people called Quakers that came to the city of Cork, in the same year, 1655, and with Edward Burrough and Francis Howgil, who also arrived the same year, were instrumental to the conviction of many in the province of Munster, and particularly in Cork.

Not long after this several were convinced, as Elizabeth Gardner, (a faithful, zealous woman who lived and died in the truth,) Samuel Claridge, James Fade and William Wadman.

The aforesaid Elizabeth Fletcher visited Ireland a second time about two years after,* and Francis Howgil recommended her by the following testimony addressed to the Friends of Ireland: "I am glad that my dear and well beloved sister, Elizabeth Fletcher, (who is a helper and worker in the Lord's vineyard,) is moved to come to you again, who is sound, honest, precious, and of good report in the family of God, who I know will be serviceable to the Lord and to you, in this his day wherein he is spreading his name through the nations." FRANCIS HOWGIL.

The said Elizabeth Fletcher having declared truth in the market place at Youghall, after she had had a large and satisfactory meeting, James Wood, an independent teacher, opposed women's preaching; but she, having spoken largely before, and particularly among other things, of the Lord's pouring forth his spirit upon sons and daughters according to the prophet Joel, and recommended the people to the grace of God, was not forward to answer his cavils; but James Sicklemore and Edward Laundy took up the argument in her behalf, and in the conclusion truth prevailed over the opposition then raised against it.

About this time, W. E., relates in his journal that he had some drawings on his spirit to go for England, and see George Fox, whom he had not yet seen; and accordingly went over, and met with him at Badgeley in Leicestershire, and that George Fox took notice of him, and they went into a retired place, where George Fox kneeled down and prayed, and that the Lord's heavenly power and presence was there: he told George of several being convinced in Ireland, and of the openness amongst people in the North of that nation to hear the truth declared, and of the want of ministering Friends in the gospel there, who hereupon wrote the following epistle to Friends of Ireland, and sent it by William Edmundson, viz.:

*As this record of the Friends of Ireland may be relied on as authentic, the person called Elizabeth Fletcher, who in Sewel's History, p. 91, is said to have died soon after the abuse she received in the year 1654, must either have been another of the same name, or else it must have been a mistake that she died soon after that time.

"Friends,—In that which convinced you, wait, that you may have that removed you are convinced of, and all my dear Friends, dwell in the the life and love, and power, and wisdom of God, in unity one with another, and with God; and the peace and wisdom of God fill all your hearts, that nothing may rule in you but the life, which stands in the Lord God. G. F.

And W. E. upon his return to Ireland read the foregoing epistle to Friends in a meeting, whereupon he further relates that the power of the Lord seized on them, whereby they were mightily shaken and broken into tears.

(To be continued.)

It is a severe rebuke upon us, that God makes us so many allowances, and we make so few to our neighbor; as if charity had nothing to do with religion; or love with faith that works by it.

I find all sorts of people agree, whatsoever were their animosities, when humbled by the approaches of death; then they forgive, then they pray for and love one another; which shows us, that it is not our reason, but our passion that makes us hold up the feuds that reign among men in their health and fullness.

THE CHARMS OF LIFE.

There are a thousand things in this world to afflict and sadden, but Oh! how many that are beautiful and good! The world teems with beauty—with objects which gladden the eye and warm the heart. We might be happy if we would. There are ills we cannot escape—the approach of disease and death, of misfortune, the sundering of earthly ties, and the canker worm of grief; but a vast majority of the evils that beset us might be avoided. The curse of intemperance, interwoven as it is with all the ligaments of society is one that never strikes but to destroy. There is not one bright page upon the record of its progress, nothing to shield it from the execration of the human race. Do away with all this, let wars come to an end, and kindness mark the intercourse between man and man. We are too selfish, as if the world was made for us alone. How much happier would we be were we to labor more earnestly to promote each other's good. God has blessed us with a home that is not dark. There is sunshine everywhere—in the sky, upon the earth—there would be in most hearts, if we would look around us.

The storms die away and a bright sun shines out. Summer drops her tinged curtain upon the earth, which is very beautiful, even when autumn breathes her changing breath upon it. God reigns in heaven. Murmur not at a being so bountiful, and we can live happier than we do.—*Lawrence Sentinel.*

TANNER'S LECTURES.

(Continued from page 140.)

In 1707, William Jenkins informed the Quarterly Meeting that his continuance at Sidcot was uncertain, as the tenant under whom he rented the house was about to leave the estate. A committee was appointed to confer with him, but their report was not recorded. I have, however, been able to trace the issue of this difficulty, by applying to Joseph Davis. The deeds of Sidcot School, which he has kindly examined for me, show that the property on which the present school has been erected, was conveyed to William Jenkins in 1709. This is all the more interesting, as leading to the inference that William Jenkins conducted his school from 1709, if not before, in the house in which John Benwell kept school many years afterwards, and which partly served the purposes of the present institution, up to the year when the new house was erected. In 1708, the following answer was given by the Quarterly Meeting of Somerset, to the Yearly Meeting, to a query which had been adopted on the subject:—"Our godly care is continued in the good education of Friends' children, insomuch that many people who are of different persuasions send their children to table at a Friends' school, and allow them to go to meetings constantly." William Jenkins sold the property in 1729, at which period he removed to Bristol. His name appears for some years after this in the book in which the names of the Bristol *ministers* were entered.

Another Friend, in the station of minister, had opened a school within the compass of the North Division, a little before William Jenkins left Sidcot. This was Jonah Thompson, from Westmoreland, who removed to Yatton in the year 1728, and conducted a school there up to 1735, when he married and went to reside in Dorsetshire. In 1756, he came to Bristol, and conducted the school at the Workhouse for about three years. Returning again into Dorsetshire, he established the school at Compton, afterwards conducted by his son Thomas, at which a large number of Friends in this part of the country received their education. The celebrated Dr. Thomas Young, a native of Milverton, was among the Compton scholars. Jonah Thompson was extensively engaged in the work of the ministry, and his representations of Gospel truth are said to have been acceptable to persons of various denominations.* He paid two religious visits to North America; the first of these was in 1750. The Monthly Meeting of Sherborne and Bridport, to which he then belonged, was very small, and Jonah Thompson was accustomed to relate that on the occasion of his proposing to his friends to visit America, those who were present expressed their entire approval; but that after

* *Piety Promoted*, Vol. iv. p. 100.

some time had been spent in deliberation, one of the friends said, "Jonah, there is no one among us that can write a certificate but thee, and thee must draw it up thyself." This he accordingly did. Through the kindness of his grandson, Jonah Thompson of Hitchin, from whom I received this anecdote, I have had a sight of this certificate, which is in Jonah Thompson's hand-writing. The anecdote certainly points to the need there was in those days, for the labors of the schoolmaster to be further extended. Soon after Jonah Thompson left Bristol, the school was placed under the care of James Gough, who had been an usher under Alexander Arcott, and had subsequently settled in Ireland, whither he again removed at a later period. James Gough was another of the vigorous minded and well educated men who came from Westmoreland in the early days of our Society, and took up their residence in the south of England. Like several others of the schoolmasters of whom I have spoken, James Gough labored extensively as a minister of the Gospel.*

Reference is made in the Somersetshire minutes, to schools established during the last century at Long Sutton, Glastonbury, &c., which received more or less pecuniary assistance from the Society. The school established by John Benwell, at Yatton, in 1790, and afterwards removed to Sidcot, on account of the situation being considered more healthy, appears at first to have been under the notice of a Monthly Meeting's Committee. Friends in Bristol were for some years accustomed to send their boys to a school at Gildersome, in Yorkshire. On the occasion of the establishment of Ackworth school, in 1779, the Quarterly Meeting of Somerset sent a contribution to its funds, of £114 : 10 : 0. From this period until 1808, when our Sidcot school was established, many scholars were sent to Ackworth, from this Quarterly Meeting.

In speaking of the schoolmasters who resided in this neighborhood, I must not omit the name of Anthony Purver, the translator of the Bible. He was for some years a member of Frenchay Monthly Meeting. He lived as tutor in a Friend's family, at Hambrook, and whilst there he translated some of the minor prophets. He subsequently kept a boarding-school at Frenchay, and removed thence to Stapleton. John Player, who was one of his scholars, remembered hearing him speak of his having been able, when a boy, to commit six chapters of the Bible to memory in an hour.† His translation of the Old Testament is, I believe, considered to have the merit of keeping very close to the original. An attempt which he made to publish portions of his translation in Bristol, was unsuccessful; but the whole

was afterwards published in London. In a sketch of his life, by Joseph Gurney Bevan which Paul Bevan has kindly lent me, the question is raised whether Anthony Purver does not stand alone in having completed the translation of the whole Bible into English. In 1758, he removed to Andover, where he died in 1777, aged seventy five. Arduous as were his literary engagements, they did not prevent his laboring and travelling as a minister of the Gospel.

The early Meetings for discipline do not appear to have been usually preceded, as at present, by a joint meeting for worship of men and women Friends; but Monthly Meetings for worship were held at different places. In 1694, one of the minutes of the Bristol Meeting recommends its members to encourage Kingsweston Friends, by attending their Monthly Meeting, which was held on first days, "they being declining, and weak, and few in number."

In 1694, it was concluded to appoint a Yearly Meeting in Bristol, for the south western counties; such meeting to be held a little before the time of the Yearly Meeting in London, to which it was made subject. In an epistle issued by the Men's Meeting in Bristol, inviting Friends of other counties to attend this meeting, allusion is made to the "cloud of darkness which had been over the city for some years past," by reason of the persecution from without, and the trials from within, to which Friends had been exposed: and this being now in great measure removed, they call upon their friends to come and rejoice with them. The object of this gathering is further described in the words, "to the end that we in this Gospel day, after the enjoyment of so many evangelical privileges, may know the restoration of, and keep the holy feast of unleavened bread (in) sincerity and truth, together; and that for the time to come our holy and heavenly relation in Christ Jesus may be increased and continued," &c. Mention is also made of the number of ministering Friends who could not attend the Yearly Meeting in London, as a reason for establishing this Bristol Meeting. These meetings occupied three days: one morning was devoted to a meeting of ministering Friends, and the Temple Street meeting-house was appropriated to the use of women Friends, if they should incline to meet. Queries were adopted by the Bristol Yearly Meeting, to be answered by the Quarterly Meetings composing it, in relation to Friends travelling as ministers without certificates; to the keeping up of meetings; the prevalence of love and unity among Friends; and the spreading of their principles. Suggestions were at different times made, to the effect that this Yearly Meeting should be held alternately in the different counties composing it, and in 1720, it was decided to hold an Annual Meeting for Worship, in addition to the Yearly Meeting in Bristol, which from its being held at different

* Life of James Gough.

† There is now in the possession of Fanny and Mary Player, of Tockington, a Cambridge concordance, which belonged to Anthony Purver.

places in turn, was called the Circular Meeting.* These Circular Meetings were often held in places where there were but few, if any, Friends, and were largely attended, both by Friends from a distance, and by persons not belonging to the Society.

An anecdote of Samuel Bownas, connected with one of these meetings (held, I think, at Ilminster) was related to me by the late Young Sturge. Samuel Bownas had the habit of pausing between his words and sentences, when he stood up to preach, but usually became more fluent as he proceeded. On the occasion referred to, a lady who had been accustomed to attend the Circular Meetings when they were held in her neighborhood, interrupted Samuel Bownas soon after he began to speak, by remarking that she thought it would be well for him to sit down, as many other ministers were present. Samuel Bownas, looking towards her, said, "Have patience, woman, 'twill be better bye and bye." Having in the end preached a very remarkable sermon, the lady in question came to him after meeting, and apologised for the interruption she had caused him. Young Sturge also mentioned to me the accounts he had heard of the kind and fatherly care which Samuel Bownas was accustomed to extend to younger ministers, and that being present on one occasion when some Friends were complaining of the mistakes which a young man had made in his ministry, and fearing they would deal with him in a manner which would prove discouraging, he put them by from their intention of speaking to him, by saying, "Leave the young man to me." The account of Samuel Bownas's own experience, in the early period of his ministry, is as interesting as it is instructive. During his first visit to the West of England, he felt it to be his duty in attending the funeral of a deceased Friend, to take his pocket Bible with him, and to preach with it in his hand: turning to various texts in support of the doctrine which he preached, and pressing earnestly on his hearers the duty of reading the Bible carefully, and of seeking the Lord by prayer, for the assistance needed to enable them to practise what they read. It afterwards transpired that several ministers of other denominations, with many of their hearers, were present; and that one of these ministers had some time before publicly charged Friends with denying the Scriptures, and not making use of them to prove that which they preached.†

It would be easy to give many interesting

* In the Somersetshire minutes, there are references to the expenditure incurred on different occasions, on account of the Circular Meetings:—in 1743, for seating the Town Hall, at Wells; and on another occasion for a booth erected at Bridgwater. In 1764, Friends were appointed to acknowledge Earl Pawlett's kindness in allowing the use of Crewkerne Market-house for a like purpose.

† Life of Samuel Bownas, pp. 22 to 25.

extracts from Samuel Bownas's Journal. Apart from its value in a religious point of view, that book may be safely said to exhibit more originality and liveliness of mind than are to be found in many volumes, the authors of which have made these characteristics their prominent object. Like his friend Jonah Thompson, with whom he sometimes travelled, and to whom he left some of his manuscripts, and his travelling gear, Samuel Bownas was a native of Westmoreland, and like him he afterwards resided in Somersetshire and also in Dorsetshire.

I find the name of Samuel Emlen, of Philadelphia, among those of the ministering Friends who resided for a time in Bristol, during the last century. Many traditions have been handed down of his extraordinary gifts as a minister, and his remarkable spiritual discernment.

(To be continued.)

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIFTH MONTH 21, 1859.

Philadelphia Yearly Meeting of Friends commenced its sittings on the 13th inst. As we shall publish full extracts from the printed minutes, it seems unnecessary to give a lengthened detail of its proceedings.

There were no subjects laid over for consideration from the minutes of last year, and no new business was sent forward in any of the reports. The meeting was unusually well attended, and among the large body of Friends who participated in its interesting proceedings, many among the young and middle aged were noticed.

The subject of education, and the necessity for a school where teachers in membership with the Society can be qualified to assume the responsibilities of instructing our youth, called forth much expression from Friends in different parts of the Yearly Meeting, and though no action was taken this year, the minds of Friends are evidently preparing to embrace and carry out some well digested plan, by which this important end can be accomplished. The meeting closed after one session on Sixth-day morning.

We insert a communication from a friend who was present at the Women's Yearly Meeting.

DIED, 3d mo. 30, 1859, at Locust Valley, L. I., ELIZABETH COCK, relict of Samuel Cock, in her 90th year, a member of Westbury Monthly Meeting.

—, On the 29th of 4th month last, MARY PAUL, in the 53d year of her age, a useful member of Richland Monthly Meeting. Her sufferings were great, but her mind was preserved in quiet resignation to the Divine will, and she was favored to make a peaceful and happy close.

DIED, in Mendon, Monroe Co., N.Y., on the 3d inst., of typhoid fever, CHARLES G. son of William and Sarah Ann Cornell, aged 11 years, 11 months and 10 days.

For Friends' Intelligencer.

The business of Philadelphia Yearly Meeting of Women Friends, whose sessions closed on the 13th inst., has been of a deeply interesting character.

The epistles from other Yearly Meetings introduced some topics of importance. Among these was the necessity of evincing by our life, and works the influence of the right spirit, and mothers were directed to the importance of home duties; by conscientiously performing these, they would be better qualified to enlarge their sphere of usefulness, and to stimulate their children to the cultivation* of their highest powers.

The epistles from Genessee warned against the undermining influence of tale-bearing and detraction. The subject of suitable reading, and the advantage to be derived by the young from an acquaintance with the Scriptures, was introduced by the Baltimore epistle. The cause of the colored race and the Indian claimed sympathy from them, and Friends were recommended to faithfulness toward their brethren, whose wrongs are known in their midst.

Whilst the answers to the first query show a deficiency in the attendance of some of the meetings, several circumstances were related to show that such omissions were no evidence of neglect of this testimony. A Friend from Canada appealed to the older members to make our meetings attractive. It always gladdened her heart to be surrounded by the young whose feelings are fresh and pure.

Members were reminded not to be satisfied with the performance of this single duty, but to give evidence of entire consistency by visiting the widow and the fatherless in their affliction, and by sympathy with the wronged of all classes. Those whose time is at their own disposal were encouraged to cherish the feeling that would lead them to visit the smaller meetings where there are those who are glad to partake of the crumbs that fall.

The fifth query introduced remarks upon the importance of assisting the necessitous in business, and preparing their children for a useful life. This beautiful order was alluded to, and Friends were reminded that such as are capable should be equally desirous to administer to the spiritual wants of the suffering, and to give balm to the erring; thus would greater sympathy exist throughout the body and no injury be given to the feelings of any one.

The answers returned to the sixth query from most of the quarters, alluded to the indulgence in the use of slave produce. The reading of these was followed by an affecting acknowledgement from an aged Friend, of her having quenched

the living conviction of her own mind, in relation to abstinence from slave produce more than thirty years ago. In a conversation with a valued Friend, she was induced by his reasonings to compromise the conviction, and refrain from thus bearing her testimony against the wickedness of slavery. She made an appeal to the consciences of the young around her, to mind the light, whilst she declared her regret that she had been thus unfaithful, and thereby had suffered great loss. The sentiment was also expressed that a strict testimony be borne against priestcraft as a slave and war sustaining principle.

In reference to the eighth query, it was urged that offenders be visited with a spirit full of love, seeking their restoration in the spirit of true charity.

The second annual answer informs the meeting, that there are 43 schools of the description queried after, under the care of committees appointed by the Preparative or Monthly meetings. The subject of education thus brought before the meeting, induced appeals to counteract the tendency to extravagance, so apparent everywhere, by encouraging the spirit of simplicity in home training, that simplicity which recognizes the dignity of labor, in cultivating the independent and useful habits of domestic economy and activity.

A friend from Baltimore, introduced a concern she had long felt, that our Society should have an Institution for the liberal and guarded education of its members, especially for such as had the ability and desire to enter the profession of teachers. She reminded the meeting, of the labors of William Penn, Isaac Pennington, John Stubbs, and others, who so nobly and effectually contributed to the dissemination of the views of George Fox; their learning enhanced their usefulness, and so far from inducing a spirit of pride, their acquirements only served to humble them in a sense of their own unworthiness.

The Friend expressed her desires that an association be formed of the members of the Yearly Meetings of New York, Philadelphia and Baltimore, for the establishment of such an Institution, with an endowment which would afford full advantages to all. These views claimed the attention of the meeting, and the hope was expressed that the importance of the subject would be deeply felt; it was urged that the present is the time for action, and as many are now suffering for want of a suitable boarding school, it was suggested that unnecessary delay would unavoidably deprive many of our youth of the advantages such an establishment would afford. On the last sitting, a wish was expressed that Friends' might promote the cause of education in their own neighborhood by a liberal support of their smaller schools. The close of the meeting was marked with deep solemnity and feeling. G.

A strong man never changes his mental characteristics, or a contrast between the Apostles Paul and John. By T. H. HEADLEY.

There is no error more common than to erect a single standard by which to judge every man. Temperament and mental peculiarities do not change with moral character. The man of fierce and ardent nature, who loves excitement and danger, and enjoys the stern struggle and field of great risks, does not become a lamb because his moral nature is renovated. His best energies will pant for action as much as ever, but seek different objects, and aim at nobler results. Half the prejudice and bigotry among us grows out of the inability or unwillingness to allow for the peculiar temperament or disposition of others. The world is made up of many varieties, and our Saviour seems to have had this fact in view when he chose his Apostles. As far as we know their characters, they were widely different, and stand as representatives of distinct classes of men. The object of this doubtless was to teach us charity. Take three of them, Peter, John and Paul, (the latter *afterwards* chosen, but by divine direction,) and more distinct, unlike men cannot be found. Peter, like all Galileans, who resembled very much the Jewish nation in character, was rash, headlong and sudden in his impulses. Such a man acts without forethought. When Christ appeared on the shore of the lake, Peter immediately jumped overboard and swam to him. On the night of the betrayal, when the furious rabble pressed around his Master, he never counted heads, but drew his sword and laid about him, cutting off an ear of the High Priest's servant. Such a man loves to wear a sword; we venture to say he was the only apostle who did. When Christ said, "All of you shall be offended because of me this night," Peter was the first to speak, declaring confidently that, though all the others might fail, yet he would not. Said he, "though I should die with thee, yet will I not deny thee." A few hours after, under an equally sudden impulse, he not only denied him, but swore to the lie he uttered. Paul could not have done this without becoming an apostate. He acted deliberately, and with forethought and decision. Peter's repentance was as sudden as his fault—one reproachful, mournful look, and he went out and wept bitterly.

But the contrast we love to contemplate most of all, is that exhibited by John and Paul. In the former, sentiment and sympathy predominated over the intellectual powers, while the latter was all intellect and force. The former was a poet by nature—kind, generous and full of emotion. He loved to rest in the Saviour's bosom, and to look up into his face. His was one of those nature's which shun the storm and tumult of life, and are happy only when surrounded with those they love. Perfectly absorbed in affection for Christ, he had no other wish but

to be near him—no other joy but to drink in his instructions, and receive his caress. Even if he had not been a Christian, he would have possessed a soul of the highest honor, incapable of deceit and meanness. He betray, or deny his Master! every faculty he possessed revolted at the thought.

No threats nor torture can unwind a mother's arms from her child; if torn from it, she goes through danger from which the boldest shrink, to embrace it again. So when the Roman soldiery and the clamorous rabble closed darkly around the Saviour, Mary was nearer the cross than them all, and heeded not their scoffs, feared not their violence. There too stood John by her side, rivalling even the mother in love. He forgot he had a life to lose, he did not even hear the taunts that were rained upon him, nor see the finger of scorn that pointed at his tears. Christ, in the midst of his sufferings, was struck with this matchless love, and bade him take his place as a son to his afflicted mother.

Throughout his life he exhibits this warm and generous nature; his epistles are the outpourings of affection; and love, love is his theme from first to last. Place him in what relations you will, and he displays the same lovely character. When banished to Patmos, he trod the solitary beach, lulled by the monotonous dash of waves at his feet, he was placed in a situation to develop all the sternness and energy he possessed, yet he is the same submissive, trusting spirit as ever. When addressed by the voice from heaven, he fell on his face as a dead man; and when the heavens were opened on his wondering vision, and the mysteries and glories of the inner sanctuary were revealed to his view, he stood and wept at the sight. In strains of sublime poetry, he poured forth his rapt soul, which, dazzled by the effulgence around it, seems almost bewildered and lost.

And when the lamp of life burned dimly, and his tremulous voice could hardly articulate, he still spoke of love. It is said he lived to be eighty years of age, and then too feeble to walk, was carried into the church on men's shoulders, and though scarce able to speak, would faintly murmur: "Brethren, love one another." Affection was his life, and it seemed to him that the world could be governed by love.

But while he was thus breathing forth his affectionate words, Paul was shaking Europe like a storm. Possessing the heart of a lion, he too could love, but with a sternness that made a timorous nature almost shrink from his presence. Born on the shores of the Mediterranean, with the ever-heaving sea before him, and an impenetrable barrier of mountains behind him, his mind early received its tendencies, and took its lofty bearing.

In Jerusalem, he had scarcely completed his studies before he plunged into the most exciting scenes of those times. The new religion, pro-

fessing to have the long promised Messiah for its founder, agitated the entire nation. To the proud young scholar, those ignorant fishermen, disputing with the doctors of the law, and claiming for their religion a superiority over his own, which had been transmitted through a thousand generations, and been sanctioned by a thousand miracles and wonders, were objects of the deepest scorn. Filled with indignation, and panting for action, he threw himself boldly into the struggle, and became foremost in the persecution that followed. Arrested by no obstacles, softened by no suffering, he roamed the streets of Jerusalem like a fiend, breaking even into the retirement of the Christian's home, dragging thence women and children, and casting them into prison. One of those determined men, who, once having made up their minds to a thing, can be turned aside by no danger, not even by death, he entered soul and heart into the work of extermination.

As in imagination, I behold him in that long journey to Damascus, whither his rage was carrying him, I often wonder whether, at night, when exhausted and weary, he pitched his tent amid the quietness of nature, he did not feel doubts and misgivings creep over his heart, and if that stern soul did not relent. As the sun stooped to his glorious rest in the heavens, and the evening breeze stole softly by, and perchance the note of the bulbul filled the moonlight with melody, it must have required nerves of iron to resist the soothing influences around him. Yet young as he was, and thus open to the beauties of nature, he seemed to show no misgivings.

But the wonderful strength of his character is exhibited nowhere more strikingly, than when smitten to the earth and blinded by the light and voice from heaven. When the trumpet arrested the footsteps of John, on the isle of Patmos, he fell on his face as a dead man, and dared not stir or speak till encouraged by the voice from on high, saying, "Fear not!" But Paul, or Saul, as he was then called, though a persecutor and sinner, showed no symptoms of alarm or terror. His powerful mind at once perceived the object of this strange display of divine power, and took at once its decision. He did not give way to exclamations of terror, or prayers for safety, but, master of himself and his faculties, said, "Lord, what wilt thou have me to do?" Something was to be done he well knew; this sudden vision and voice were not sent to terrify, but to convince; and ever ready to act, he asked what he should do. The persecutor became the persecuted, and the proud student, the humble, despised disciple of Jesus of Nazareth, and leaving the halls of learning, and companionship of dignitaries, he cast his lot in with the fishermen.

This was a great change, and religion effected it all, yet it could not alter his mental characteristics. He was just as determined, and resolute, and fearless as ever.

He entered Jerusalem, and made the Sanhedrim shake with his eloquence. Cast out of the city, he started for his native city—for the home of his boyhood—his father's house—his kindred and friends. Thence to Antioch and Cypress, along the coast of Syria to Greece and Rome, over the known world he went like a blazing comet, waking up the nations of the earth.

John, in giving an account of the revelations made to him declares, that he wept at the sight. Paul, in his calm, self-collected manner, when speaking of the heavens opened to his view, says simply that he saw things which were not lawful for man to utter. From the top of Mars Hill, with the gorgeous city at his feet, and the Acropolis and Parthenon behind him, on the deck of his shattered vessel, and in the gloomy walls of a prison, he speaks in the same calm, determined tone. Deterred by no danger, awed by no presence, and shrinking from no contest, he moves before us like some grand embodiment of power.

His natural fierceness often breaks forth in spite of his goodness. He quarrelled with Peter, and afterwards with Barnabas, because he insisted that Mark should accompany them in their visit to the churches. But on a former occasion, Mark had deserted him, and he would not have him along again. Stern and decided himself, he wished no one with him who would blench when the storm blew loudest, and so he and Barnabas separated. Paul had rather go alone than have ten thousand by his side, if they possessed fearful hearts. So when the High Priest ordered him to be smitten, he turned like a lion upon him, and thundered in his astonished ear, "God shall smite thee, thou whited wall!"

He would not submit to wrong unless made legal by the civil power, and then he would die without a murmur. When his enemies who had imprisoned him illegally found he was a Roman citizen, they in alarm sent word to the jailor to release him. But Paul would not stir. "They have seized me wrongfully," said he, "and now let them come themselves and take me out publicly." He was stern but not proud, for he said, "I am the least of the saints, not fit to be called an apostle."

Bold, but never uncourteous, untiring, undismayed, and never cast down, love to God and man controlled all his acts. A truer heart never beat in a human bosom. What to him was wealth! What the smiles or frowns of the great, and the triumph of factions! With a nobler aim, enthusiastic in a worthier cause, sustained by a stronger soul, he exclaimed, "I glory in the cross." The sneering world shouted in scorn, "the cross! the cross!" to signify the ignominious death of his Master. "The cross! the cross!" he echoed back, in tones of increased volume and power, till the ends of the earth caught the joyful sound. The united world

could not bring a blush to his cheek or timidity to his eye. He could stand alone amid an apostate race, and defy the fury of kings and princes. Calm, dignified and resolved, he took the path of duty with an unflinching step. No malice of his foes could deter him from laboring for their welfare, no insult prevent his prayer in their behalf, no wrongs heaped on his innocent head, keep back his forgiveness.

One cannot point to a single spot in his whole career where he lost his self-possession, or gave way to discouragement or fear. An iron man in his natural characteristics, he was nevertheless humble, meek, kind and forgiving. And then his death, how indescribably sublime! As a war-worn veteran, battered with many a scar, though in spiritual warfare, looking back not with remorse but joy, not clinging to the earth, but anxious to depart. Hear his calm, serene voice, ringing above the storms and commotions of life: "I am now ready to be offered, and the time of my departure is at hand. I have fought a good fight, I have finished my course—there is laid up for me a crown of righteousness."

Thus passed away this powerful man. I have spoken but little of his moral character, of his faith, or religious teachings, but have confined myself chiefly to those natural traits which belong to him as a man, independent of that peculiar power and grace given him by God. Hence, I have treated him with a familiarity which might seem unwise, had I spoken of him as an inspired apostle. I wished to show how widely apart in their characters men equally good may be.

THE TIME FOR PRAYER.

From "the Eglantine," by Georgiana Bennet, a volume of unpretending, but sweet and graceful poems.

When is the time for prayer?
With the first beams that light the morning's sky,
Ere for the toils of day thou dost prepare,
Lift up thy thoughts on high;
Commend the loved ones to His watchful care:—
Morn is the time for prayer!

And in the noontide hour,
If worn by toil, or by sad cares oppress,
Then unto God thy spirit's sorrow pour,
And he will give thee rest:—
Thy voice shall reach Him through the fields of air:—
Noon is the time for prayer!

When the bright sun has set,—
Whilst yet eve's glowing colors deck the skies;—
When with the loved, at home, again thou'st met,
Then let the prayer arise
For those who in thy joys and sorrow share—
Eve is the time for prayer!

And when the stars come forth—
When to the trusting heart sweet hopes are given;
And the deep stillness of the hour gives birth
To pure, bright dreams of heaven,
Kneel to thy God—ask strength, life's ills to bear:—
Night is the time for prayer!

When is the time for prayer?
In every hour, while life is spared to thee—
In crowds or solitude—in joy or care—
Thy thoughts should heavenward flee.
At home—at morn and eve—with loved ones there,
Bend thou the knee in prayer!

[From the Knickerbocker.]

THE MARRIAGE VOW.

Look how they come—a mingled crowd
Of bright and dark, but rapid days:
Beneath them, like a summer cloud,
The wild world changes as ye gaze! BRYANT.

Speak it not lightly!—'tis a holy thing,
A bond enduring through long distant years,
When joy o'er thine abode is hovering,
Or when thine eye is wet with bitterest tears;
Recorded by an angel's pen on high,
And must be questioned in eternity!

Speak it not lightly!—though the young and gay
Are thronging round thee now, with tones of mirth,
Let not the holy promise of to-day
Fade like the clouds that with the morn have birth;
But ever bright and sacred may it be,
Stored in the treasure-cell of memory,

Life will not prove all sunshine; there will come
Dark hours for all: O will ye, when the night
Of sorrows gathers thickly round your home,
Love as ye did, in times when calm and bright
Seemed the sure path ye trod, untouched by care
And deem'd the future, like the present, fair?

Eyes that now beam with health, may yet grow dim,
And cheeks of rose forget their early glow;
Languor and pain assail each active limb,
And lay, perchance, some worship'd beauty low;
Then will ye gaze upon the altered brow,
And love as fondly, faithfully as now?

Should fortune frown on your defenceless head,
Should storms o'ertake your bark on life's dark sea—
Fierce tempests rend the sail so gaily spread
When Hope her syren strain sang joyously;
Will ye look up, though clouds your sky o'ercast,
And say, "Together we will bide the blast"?

Age, with its silvery locks, comes stealing on,
And brings the tottering step, the furrow'd cheek,
The eye from whence each lustrous gleam had gone,
And the pale lip, with accents low and weak:
Will ye then think upon your life's gay prime,
And smiling, bid Love triumph over Time?

Speak it not lightly! Oh! beware, beware!
'Tis no vain promise, no unmeaning word:
Lo! men and angels hush the faith ye swear,
And by the high and holy ONE 'tis heard:—
O then kneel humbly at His altar now,
And pray for strength to keep your marriage vow
New York May, 1840. M. N. M.

KIND WORDS.

They never blister the tongue or lips. And we never heard of any mental trouble arising from this quarter. Though they do not cost much, yet they accomplish much. They help one's own good nature and good will. Soft words soften our own souls. Angry words are fuel to the flame of wrath, and make it burn more fiercely. Kind words make other people good-natured. Cold words freeze people, and hot words

scorch them, and bitter words make them bitter and wrathful words make them wrathful. There is such a rush of all other kinds of words in our day, that it seems desirable to give kind words a chance among them. There are vain words, and idle words, and silly words, and hasty words, and spiteful words, and empty words, and profane words, and boisterous words, and warlike words. Kind words also produce their own image on men's souls. And a beautiful image it is. They soothe, and quiet, and comfort the hearer. They shame him out of his sour, morose, unkind feelings. We have not yet began to use kind words in such abundance as they ought to be used.—*Pascal.*

THE NEGRO CREW.

Our brig left the sickly shores of Africa on a mid-summer's afternoon. It was the rainy season, and though the sun shone upon our departure through a sky of dazzling blue, yet rain had been pouring down in torrents during the forenoon. Our vessel seemed to be in a dilapidated condition, albeit she had left England in good repair. She had been up the river for wood, and was much battered about whilst taking in a cargo of African teak and mahogany, for the loading of which there were no proper conveniences in such an outlandish part of the world. These species of wood are of greater specific gravity than water, in which they sink like a piece of lead, so that the brig was very heavily laden. The shipping of the cargo, and the intense heat of a tropical sun, had peeled the paint off the ship's side, and gave her a most ungainly appearance; but she was water-tight, which was not always the case with vessels leaving this fiery region in the *dry* season. If proper attention be not then paid to wetting the deck and sides, the solar beams open their planks and burn up the caulking, so that they have sometimes been in danger of foundering on their voyage homeward. We were detained in the river by matters concerning the crew, most of whom were sick, and some were obliged to be left behind. There were, therefore, few white hands fit for working, and the authorities required the captain to take several black sailors, more, indeed, than he was willing to employ.

As we were leaving, two additional seamen were put on board as passengers to England. They belonged to a schooner, which had been recently wrecked on the African coast. The crew of the ill-fated vessel had sailed in good health, with the usual bright anticipations of soon reaching their native land, but they were detained on the sultry coast by calms and baffling winds. Unable to get out to sea, and oppressed with the sickly atmosphere which reached them from the shore, they had fallen victims, one by one, to the African fever. Two only remained alive, and they were in a weak condition, so that, being un-

able to manage the vessel, it drifted ashore, became a wreck, and was plundered by the natives, who nevertheless assisted the survivors of the crew to reach the nearest British settlement, whence they were forwarded homeward by the government. The feelings of these poor fellows may be better imagined than described when they saw their shipmates daily dying off, and at last found themselves alone, drifting about on a lee-shore, without the possibility of helping themselves. Morning after morning they mustered up courage to throw the dead body of a friend into the sea, and turned away in disgust from the sight of the greedy sharks contending for their prey. Morning after morning the same tropical sun poured her vertical rays upon them, as the ship lay helpless like a log upon the waters, and the sultry, vitiated atmosphere dried up body and soul, and warned them of a coming doom. But the breeze, which drove their vessel upon the breakers, saved them from destruction. They then seemed so depressed in spirits that one would have thought they would never go to sea again; but such is the elasticity of the human mind that it soon rises above its distresses, and again braves similar dangers to those in which it had well nigh sunk.

We almost feared that we should meet with the same fate as the crew of the schooner, and that the two rescued ones would experience a second tragedy. Our brig was too unwieldy to make any headway by tacking against the light sea-breeze, which usually blows in the day time, and the night land-breeze was very faint indeed. However, we gained a few miles before morning. It was then that I first knew the whole of our perilous circumstances. The captain came to consult me about two of the men who were "down again." The African fever first assails the body in a violent form; but if this "hot stage" can be broken, it becomes intermittent, and is more manageable, the only danger being that of a relapse. When an early intermission can be obtained, the disease is quickly conquered by quinine (which is our sheet-anchor in West Africa), especially if aided by wine and good nursing. These men had come on board from the hospital, being convalescent, and they ought to have remained quiet till fairly out at sea; but having wrought with the others in getting the brig under weigh, eaten heartily of sailor's fare, and slept in a close cabin on a suffocating night, they were now likely to have a severe relapse, being already in a burning fever. The first prescription was "five and fifteen," with plenty of hot gruel. Every sailor knows what is meant by "five and fifteen;" but lest any landsman should be curious in such matters, we may inform him that it implies five grains of calomel and fifteen of jalap, a dose of no small potency. These means had their desired effect, and by the next morning the fever was "broken."

All day we were stationary on the water, panting under cover of an awning. After another oppressive night, I rose with daylight, and, huddling on some clothes, went on deck to see what progress had been made during the night. The low shore of Africa still loomed astern, and we seemed destined never to leave the "white man's grave." Whilst brooding upon it with some melancholy, the captain came up saying, "Another hand down!" and, putting on a long face, he informed me that his medicine chest was very low, as he had been unable to get his bottles replenished in Africa. I believe that he had never tried, or that he grudged the expense, for the authorities would never have sent him away, or allowed him to depart, at such a season and with a sickly crew, without sufficient medicine. But he was a regular niggard. Fortunately for us all, this part of his imprudence was of no evil consequence as I had a good supply of physic, and a quantity of wine had been put on board for my use, being the only cabin passenger. Under these circumstances I forthwith took charge of the sick, having had some practical experience of African fever. That morning, to our great joy, a spent tornado helped us seaward, and in a few days we reached the Cape Verde Islands. This is the point aimed at by vessels leaving that part of Africa, for here they fall in with the trade wind. Our brig was now like a hospital; and if it had not been for the blacks, there would not have been hands enough to trim the sails. But these sable fellows, whom I directed the captain to feed well, wrought incessantly and with the utmost good humor, and a stout negro lad, in my own service, lent a helping hand.

The sun was setting gloriously in a cloudless sky whilst we leaned over the bulwarks, gazing upon the first of the Cape Verde Islands. We did so with intense interest, wondering if the flapping sails would enable us to clear the point, or if we should be condemned to spend another night in the same oppressive atmosphere. The point was at length gained, and, as we saw the ocean on the other side of the land, we suddenly caught a whiff of the open sea breeze. It was as life to the dead. I stood inhaling the pure breath of heaven, which I had not tasted for a long time, and felt it to be like a zephyr from Paradise; for though during the larger part of the year the air in Western Africa is dry, yet it has then a very sultry feeling. It appears to be always either devoid of moisture or soaked with it—either roasting or stewing. The continent of Africa is so vast that its atmosphere is felt two or three hundred miles out at sea. Quantities of fine sand have fallen upon vessels two hundred miles from the coast; and during the rainy season ships' crews have been seized with fever without having landed. Seamen do not consider themselves in a healthy latitude till they have passed to the westward of Cape Verde Islands, where they catch the

trade wind. This wind obliges them to steer northward, usually till they reach the western isles, nearly half way between England and America, where they fall in with westerly breezes. Sailing in the trade wind is delicious, so steady is the vessel, so pure the atmosphere, so bright the heavens; and at night the deep blue sea sparkles with fire, from countless millions of phosphorescent animalcula. In one night after this change, the invalid crew, became convalescent and in a few days they all recovered. So steady is the trade wind that the sails did not require to be shifted for many days, and the men had plenty of time to recruit their strength, being only engaged in mending the gear of the vessel.

The negro sailors had now their holiday. The captain had many disputes with me concerning their character, for he was a selfish and prejudiced fellow; and though he had some good samples of the African race before his eyes, sufficient to controvert all his arguments against them, yet still he persisted in abusing this unfortunate people.

"I tell you," he exclaimed, "they are all cheats and rogues."

Upon being asked if he had ever tried to make them better, he acknowledged that he had not.

"Well, suppose they were to follow your example," said I, putting some emphasis upon the word *your*, "and that of the whites who go up the rivers for wood and ivory, would they be any better than they are?"

He hesitatingly confessed that the example of many Europeans would not improve the negroes.

"I tell you what, captain, these poor blacks have learned the white man's tricks and vices, and now you cannot cheat them so easily as you used to do, for they pay you back in your own coin; and so you are inconsistent enough to abuse them because they are ready learners of your own roguery."

Guessing that I might have heard something about his own ways and doings, he thought it most prudent to make no reply, except by a shrug of the shoulders.

The conduct of our negroes on board told greatly in favor of their race, and even the captain sometimes relented in his anathemas, and even praised their fidelity. Though he often bantered my black servant, and teased him in every possible way, the lad was always ready to lend a hand at the ropes or capstan, even without being solicited.

"That lad would risk his life for mine, captain, and you could not say this of all your countrymen."

"Would he?" replied he, doubtfully.

"Yes, in truth. Jack, come here. Suppose I were to fall into the water, would you jump in and pull me out?"

"Master, I would try," was the ready answer.

The captain seemed thoughtful, and as he gazed upon the strong frame and sparkling eyes of the

swarthy youth, he almost seemed to feel the force of the sentiment, "O, virtue, how amiable thou art!"

"It reminds me," said he, "of the negro crew, and their melancholy voyage, which occurred some years ago.—One of the very men is now on board this vessel—that blackey at the foremost. Come here, Joe."

Joe ran to know what was wanted.

"Tell this gentleman about your first voyage to England."

Joe blushed through his black skin, and tried to begin, but hesitated and could not find English words ready enough for the narrative. But from the captain and man I gathered the following account:

Joe was one of several negroes put on board an English vessel, under circumstances similar to those in which we had sailed. They were raw sailors, having only been accustomed to navigate small craft up the river or along the coast. They could pull a rope, and hoist or reef a sail, and they understood enough English to obey such instructions—and little more. Some of them had learned to read the compass, and to steer the vessel by it, according to orders. Only one could take any management of the ship's tackling.

It was the first time that Joe had gone out to sea, and seen the wonders of the mighty deep. The voyage was a melancholy one. Through calms and contrary winds, the vessel could not get away from the fatal coast of Western Africa. The white sailors sickened, one after another, and died. The mate soon perished; and as they at length proceeded on their voyage, the crew diminished until the captain and negroes alone survived. The former had spent himself with superintending the vessel, and tending his sick comrades; and having caught the fever from some of his dying crew, he was unable to rally. Daily sinking under the disease, he felt that he must soon die. It was well for the negroes that he maintained his mental faculties to the last, and could still instruct them how to guide the ship. But his final hour was approaching. He then called around him the disconsolate crew, and addressed them with tears: "I must soon die. My poor fellows! I am very sorry to leave you alone in the middle of the sea, as you don't know how to sail to England. But it can't be helped. Steer the vessel north for days, and then east, by compass, and that will bring you somewhere near England. You will probably meet some ship coming out; then hoist the union-jack upside down as a signal of distress: they will board you and take you into some port. And may God Almighty preserve and bless you, poor fellows!" After bidding each a long farewell, the captain retained the best-informed of the negroes, and gave him his keys and the ship's papers. "And there is a box of gold-dust which belongs to the owners: you will give it to them; and here is a bag of

dollars, which belongs to myself: if ever you get to England you will give it to my wife!" "Yes, massa," replied the sailor, "me gib him with me own hands. God bless massa!"

What strange thoughts at that moment possessed the heart of the gallant captain! The negroes—the ship in mid-ocean, without a pilot—his home and family in England—his grave in the sea—and the wide expanse of eternity on which he was launching! What thrilling subjects for a dying hour! He breathed his last, and was entombed, as he had directed, in the watery abyss.

When the negro crew had performed their last sad office for their gallant master, they felt themselves alone, indeed. The prospect before them was cloudy and cheerless. But they had health and strength, and they could keep the vessel a-going. They steered in the direction that had been pointed out to them, and day after day strained their eyes, looking for an unknown land, or for a strange sail to heave in sight. At last, to their great joy, a vessel was discerned in the distance. They bore down upon it, hoisted the signal of distress, and made all other signs possible to attract attention. Providence had directed them aright. They were near England, and the vessel which they saw had come out of one of the southern ports, and now approached and hailed them, in answer to their signals. "What's the matter? What do you want?" The blacks shouted, "We for Massa Fossa, Lonnon! we for Massa Fossa, Lonnon! which way we go?"

The English could not understand them, but soon perceived that there were none but negroes on board a British vessel. "None but blacks! unable to speak English! Who were they? Were they pirates, who had killed the crew and seized the ship?" Still the negroes shouted "We for Massa Fossa, Lonnon!" They were boarded, and the log-book and ship's letters soon disclosed the real state of things. A mate was left on board to take them into the nearest port. Here the same astonishment was excited; and, after quarantine had been performed, the vessel was thronged by curious persons who came to see the black crew, and hear their strange jargon. A gentleman soon came down from the owners in London, to take possession of the ship and its valuable cargo, and bring it up the Thames.

The negro to whom the captain had given his dying orders then produced everything committed to his care. He gave the box of gold-dust, untouched, and then mentioned the bag of dollars. "Give them to me," said the gentleman, "and I shall hand them over to the captain's widow." "No," said the faithful negro; "when Massa Captain die, he told me to gib em to him wife, and me gib em to no one else." When, therefore, they reached London, the widow was sent for, and she received the bag of money, and everything else that had belonged to her hus-

band, with the account of his death, (as well as they could give it), and his last message of love to her.

"Well, captain," said I, when the narrative was ended, "how many *white* sailors would you trust with a box of gold, a bag of silver, plenty of good clothes and other traps, and hope that they would be honestly delivered without having been fingered?"

Finding that I had again caught him with a fact in favor of the negro character, he turned away with an angry smile, and called his monkey to play with — *Leisure Hour*.

ITEMS OF NEWS.

LATER INTELLIGENCE FROM EUROPE.—Later intelligence from Europe has been received. The war plot thickens: Actual hostilities have commenced. The Austrians have invaded the territories of Sardinia, driving the forces of the latter before them. Meanwhile, the troops of France have hurried to the protection of their ally. A protracted war seems inevitable. England and Prussia are preparing for it. Europe has never been so profoundly agitated since the downfall of the first Napoleon. The result of the English elections had been favorable to the Derby Ministry. Breadstuffs and provisions have advanced in price, while cotton has declined.

"INCREASE OF TELEGRAPHIC BUSINESS.—Among the evidences given of the increasing business of the country, especially of a mercantile character, it is stated that the number of messages daily sent over the various telegraph lines is vastly greater at the present time than ever before. The three printing telegraph lines of the American Telegraph Company, located in Wall street, known as the Boston, Washington, and National wires, transmitted on 11th inst., respectively, 437, 336, and 442 private messages, and about six thousand words of public news reports, and that too through the very disagreeable storm which lasted the whole day.

DEPARTURE FOR LIBERIA.—The Bark Mary Caroline Stevens sailed on the 12th inst., from Baltimore for Liberia, having on board one hundred and fifty-three emigrants, most of whom are manumitted slaves.

MAPLE SUGAR.—Twelve Farmers in Greenfield, Conn., have made 12,175 pounds of maple sugar the present season. The total number of trees tapped was three thousand four hundred and twenty-two. The greatest yield per tree was four pounds, and the smallest a trifle less than three pounds. The average was about three and half pounds per tree.

THE MECHANICS,—of Green Bay, in Wisconsin, last year built a vessel for ocean navigation, which they sent, via the lakes and the St. Lawrence, to the ocean. The operation proved so successful, that they intend this year to increase the business, with the conviction that it may be made one of the permanent pursuits of the place.

CALIFORNIA.—The bill forming the six lower counties of California into a new territory, to be called Colorado, has been passed by the Senate and sent to the Governor for approval.

TELEGRAPH.—The use of the electric telegraph is rapidly extending in France. There are two hundred telegraph offices superintended by officers of the Government, besides a large number of secondary importance, under the control of the railway companies. The receipts in the Government telegraphic offices during the past year amounted to £140,000, of which £60,000 were taken in the Paris offices.

A ST. PETERSBURG letter says:—"There is some idea of establishing a new commercial port in the west of the Gulf of Finland, to be united by a canal to the waters of Cronstadt. It is also proposed to put the new port in communication, by means of a railway, with the Neva near St. Petersburg.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is still unsettled, but the excitement of the last day or two is somewhat abated. We quote sales of superfine Flour at \$8 a 8 25, and 8 50 a \$9 50 for extra family. The sales to retailers and bakers are within the range of the same figures. Rye Flour and Corn Meal are scarce, and holders have advanced prices for the former to \$5 12 a 5 25, and for the latter \$4 12 per barrel.

GRAIN.—The receipts of Wheat are light, with fair demand. Holders have put up prices correspondingly with the advance of flour—say 10 a 15 cents. Sales of Southern and Pennsylvania, at \$1 90 a 1 95 per bushel for fair and prime red. 2600 bushels inferior red Western sold at \$1 60 a 1 65c, and \$2 05 a 2 08 for white in store. Rye is in demand, and sells at \$1 07 cents. Corn is in demand; sales of good yellow at \$1. Oats are in good request; sales of prime Pennsylvania at 60 cents, and of Southern at 58 cents.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address

WM. HICKLEN,
Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,
Cheap School Book Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
4th mo. 9—3m.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON, } Assistants.
MAGGIE B. JACKSON, }
Address Kennet Square P. Office, Chester Co. Pa.
WILLIAM CHANDLER, } Proprietors.
SUSANNA G. CHANDLER, }
3d mo. 19, 1859.—10 t.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIFTH MONTH 28, 1859.

No. 11.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

(Continued from page 148.)

On Divine Worship.

John. I should think it very uncharitable to say, that nearly all the worship that now prevails in Christendom is evil; for I am certain that there are many pious men in every Christian sect.

Father. I do not say their worship is evil; for I hope and believe much of it is accepted in the Divine sight. He who beholds the hearts of all men, has graciously promised, "To that man will I look, even to him that is poor and of a contrite spirit, and that trembleth at my word." There is a dead form of silence, as well as a dead form of words; and it is equally offensive in the Divine sight. They who merely sit in outward silence, pretending to present their bodies before the Lord, while their hearts are far from him, and their thoughts wandering in pursuit of earthly objects, are assembling in a dead form.

John. Is this dead form as dangerous as the other?

Father. In one respect I think it is not so dangerous; it does not encourage the practice of using improperly the words of holy men, and the promises of scripture. That which was true in the mouth of a saint, may be a falsehood in the mouth of a sinner.

James. Yes; I have often been struck with the impropriety of that practice, and I believe it not improbable, that many a well-meaning man utters more falsehoods in time of worship than in all the week besides.

Father. There are some hymns of such a

general character, that almost any pious man may join in them without a breach of veracity; but it does not follow that they will always suit the state of his mind. There are other hymns and psalms which describe particular states of mind, and contain the expression of particular feelings and desires, which can only be sung with truth by those who are in the same state of mind. For instance, when David says, "As the hart panteth after the water-brooks, so panteth my soul after thee, O God. My tears have been my meat day and night, while they say unto me continually, Where is thy God?" Psalms xlii. 1, 3.

Now, how many singers are there in most congregations that can sing this psalm without departing from the truth? For those who are mourning, to sing the songs of joy, and for those who are rejoicing, to join the wail of sorrow, is equally inconsistent. He who joins a choir to sing in public, is expected to sing every thing that is selected for them; no matter how discordant his feelings may be, if his voice be harmonious, nothing more is required: and what is worse than all, persons who have musical talents are often induced to join the choir, while their hearts are unrenewed, and sometimes even while their moral characters are notoriously impure.

How offensive must it be to that omnipresent and holy Being, "who is of purer eyes than to behold iniquity," when he looks upon this solemn mockery, this approaching with the lips, while the heart is far from him! Will he not say to such persons, as he did to the Jews formerly, "Who has required this at your hands, to tread my courts? Bring no more vain oblations, incense is an abomination unto me, the new moons and sabbaths, the calling of assemblies I cannot away with; it is iniquity, even the solemn meeting." Under the old law, he who had touched a dead body, or an unclean beast, was not allowed to come into the congregation until he was purified; much less could he participate in an act of worship: and shall they who are "living in pleasures, and who are dead while they live," take an active part in public worship, under a more spiritual dispensation? It is evident that such cannot drink of the cup that Christ drank of, nor are they baptized with his baptism; and if they partake of the outward form while they deny and reject the life and substance, do they not drink unworthily to their

own condemnation? These remarks will not apply to those sincere and pious worshippers who are really hungering and thirsting after righteousness; for unto them there always will be a blessing. But to this class I would seriously address the inquiry, whether that worship which is offered up in the will and wisdom of man, is not calculated to keep alive that will and to nourish that wisdom by which it is performed? Now we know that our wills must be subjected to the Divine will, and we are taught that "the wisdom of man is foolishness with God," when applied to spiritual things." "The kingdom of God is within you," says Christ; and it is altogether reasonable that he should be known, and obeyed, and worshipped, in his kingdom. If he veils his presence from us,—as he often does,—then we must wait upon him. "I wait for the Lord," says the psalmist, "my soul doth wait—my soul waiteth for the Lord, more than they that watch for the morning." Psalms cxxx. 5, 6. The psalms of David, the writings of the prophets, the discourses of Jesus, and the epistles of Paul contain a great many exhortations to wait upon the Lord, and learn of him. And John, the beloved apostle, writes to the Christians of his day, and tells them, "The anointing which ye have received of him abideth in you, and ye need not that any man teach you: but as the same anointing teacheth you of all things, and is truth and is no lie, and even as it hath taught you ye shall abide in him." 1 John ii. 27.

It is also said in many places in the scriptures, that Christ himself shall be the prophet, the leader, and the teacher of his people; for he alone is the true "shepherd and bishop of souls." Now while we have such exceeding great and precious promises, how unwise are they who "compass themselves about with sparks of their own kindling," instead of waiting in patience for the Divine influence to enable them to worship in spirit and in truth.

If Christ be the teacher of his people, they that would learn of him must sometimes learn in silence; for, if we are always thinking our own thoughts, and speaking our own words, or those of others, we cannot hear the instructions that are conveyed to the soul by the impressions of the Divine spirit.

If Christians of different denominations cannot, at present, see the propriety of giving up their stated forms of prayer and praise, I am persuaded they would derive great advantage from appropriating a part of the time of their religious meetings to silent waiting upon God: it would give greater life and solemnity to the rest of their worship; and, independently of all other considerations, they would find it a most excellent discipline for the mind.

John. I find by experience, that when I wish to consider anything attentively, I can do it best in silence; and it seems reasonable that our

tongues should be still, when we undertake to examine our hearts.*

Father. There is a very instructive fact mentioned in the history of the prophet Elijah, when he was in a cave on Mount Horeb. He was commanded to go forth and stand upon the mount before the Lord. "And behold the Lord passed by, and a great and strong wind rent the mountain, and brake in pieces the rocks before the Lord, but the Lord was not in the wind; and after the wind an earthquake, but the Lord was not in the earthquake: and after the earthquake a fire, but the Lord was not in the fire: and after the fire, a still small voice. And it was so when Elijah heard it, that he wrapped his face in his mantle and went out and stood in the entering in of the cave. And behold there came a voice unto him and said, What doest thou here, Elijah?" Thus it appears that Elijah knew that the word of the Lord (to which he had long been accustomed) was not to be heard in the noise and confusion of the outward elements,—but as soon as he heard the still small voice, he wrapped his face in his mantle and listened to the Divine Monitor. We have no reason to believe, that this "word of the Lord" which came to the prophets, was conveyed in sounds to the outward ear; for God is a spirit, and the soul of man is spiritual; therefore the word by which he speaks to the soul is also spiritual.

The apostle Paul writes to the Corinthians, saying, "Know ye not that ye are the temple of God, and that the spirit of God dwelleth in you? If any man defile the temple of God, him shall God destroy; for the temple of God is holy, which temple ye are." 1 Cor. iii. 16, 17.

And the apostle Peter advises the Christians of his day, to "desire the sincere milk of the word, that," says he, "ye may grow thereby, If so be ye have tasted that the Lord is gracious. To whom coming as unto a living stone, disallowed indeed of men, but chosen of God and precious; ye also as lively stones are built up a

* A late writer, in speaking of what is termed "the Lord's Supper," makes this remark: "In all other instances of social worship, your attention is required, without ceasing, to some external process, and you pass on from one part of the service to another, with little opportunity to reflect as you proceed, or to pursue the suggestions which are made, in the manner that your own peculiar condition may require. But in this, the leisure is given for thoroughly applying to your own personal state, all that has met your ear, and for pouring out freely the devotional feeling which has been excited. And if there be anything favorable to the soul, as multitudes of devout persons have insisted, in occasions for contemplative worship in the presence of other men, then in this respect the Lord's Supper may claim a superiority over every other season of social devotion." Now, if the pauses which occur during the administration of the Supper are found to be so salutary, why may they not be introduced at other times with equal advantage?

spiritual house, a holy priesthood, to offer up spiritual sacrifices acceptable to God by Jesus Christ." 1 Peter ii. 3-6. Thus it appears that the soul of man is the temple of God, and that his church is a spiritual house, built up of living stones, of whom Jesus Christ is the "chief corner stone, elect and precious." The temple of Solomon, with all its glory, was but a faint emblem or figure of this spiritual house which God is preparing for himself to dwell in, and in which he manifests his glory and his power.

It is written of Solomon's temple that, "it was built of stone made ready before it was brought thither: so that there was neither hammer nor axe, nor any tool of iron, heard in the house while it was in building." 1 Kings, vi. 7. How striking a figure was this of the beautiful order and holy solemnity that ought to prevail, when the living stones are brought together in the assemblies of God's people! When we approach his awful presence to worship him in spirit and in truth, we should be careful not to employ the tools or ceremonies of man's invention; for the Lord, in directing his chosen people to build an altar, said, "An altar of earth shalt thou build unto me, and shalt sacrifice thereon thy burnt-offerings and thy peace-offerings: and if thou wilt make me an altar of stone, thou shalt not build it of hewn stone: for if thou lift up thy tool upon it, thou hast polluted it." Exodus xx. 24. Deut. xxvii. 5.

The offerings in God's temple are no longer of an outward nature, for "he is not worshipped with men's hands, as though he needed any thing." He requires us to give him the "first fruits" of all that we possess: we must serve him before all others, and give him the first place in our affections. The sacrifice which he accepteth is "a broken and a contrite spirit;" and the smoke of the incense which ascends up before him, is "the prayers of the saints." Rev. viii. 3.

I shall conclude this subject with a quotation from the writings of that great and good man, William Penn. "If," says he, "we are not to take thought what we shall say when we come before worldly princes, because it shall be given us, and that it is not we that speak, but the spirit of our Heavenly Father that speaketh in us; (Matt. x. 20,) much less can our ability be needed, or ought we to study to ourselves forms of speech in our approaches to the great Prince of princes, King of kings, and Lord of lords. The psalmist says, 'Lord thou hast heard the desire of the humble, thou wilt prepare their heart, thou wilt cause thine ear to hear;' and says Wisdom, 'The preparation of the heart in man, and the answer of the tongue is from the Lord.' Here it is: "Thou must not think thy own thoughts, nor speak thy own words; which is indeed the silence of the holy cross; but be sequestered from all confused imaginations, that

are apt to throng and press upon the mind in those holy retirements. It is not for thee to think to overcome the Almighty by the most composed matter cast into the aptest phrase:—no, no,—one groan, one sigh from a wounded soul; an heart touched with true remorse, a sincere and godly sorrow, which is the work of God's spirit, excels and prevails with God. Wherefore, stand still in thy mind; wait to feel something that is divine to prepare and dispose thee to worship God truly and acceptably. And thus taking up the cross, and shutting the doors and windows of the soul against every thing that would interrupt this attendance upon God,—how pleasant soever the object be in itself—how lawful and needful at another season,—the power of the Almighty will break in,—his spirit will work and prepare the heart, that it may offer up an acceptable sacrifice."

(To be continued.)

"One objection to controversy is, that those who are most forward to engage in it discover such a propensity to usurp the seat of judgment, and pronounce sentence upon each other's notions and opinions: as though a traveller could not miss his way without an intention to go wrong. It is evident that men are more apt to be earnest in dispute on uncertain, than on certain grounds, for the same reason that we are more uneasy with a doubtful than a clear title to our estates.

AN ANCIENT DOCUMENT.

It may interest some of our readers to see a copy of a report of a Monthly Meeting, held on Nantucket, in 1709. It is taken from what is supposed to be the original manuscript found among the papers of the descendants of the Starbuck family.—ED.

To ye Quarterly Meeting to be held on Rhoad Island ye next following ye date hereof.

From our Monthly Meeting held on Nantucket ye 26th day of 7th mo. 1709. Dr frds & brethren—being sencable of our duties, yt We ought to send & give an account of things here; these are to Lett you know yt throw ye Lord's mercy & goodness still continued to us, yt We have been preserved in a good degree of helth & things among us pretty Quiette & still. So yt our meetings tho but Weak yet throw ye Lord's goodness We are still encouraged to go on in his truth & hope still to gro & encreas in ye knowleg thereof, to ye honoure of our profestion; & as it hath pleased almighty God to send forth & among us his servants Whereby he hath made knowne things unto us profitable to be followed. we still desire yt ye Lord would still be pleased.

to send more such instruments for ye instructing comforting & strengthening those yt are weak. So Dr fredes We in tender Love Salute you desiring ye prosperity of ye Israel of God Every Where, & in true Love We bid you farewell.

Signed pr order & behalf of said meeting by

NATHANIEL STARBUCH,
JETHRO STARBUCH,
BARNABAS STARBUCH,
NATH'EL STARBUCH, JR.

RISE AND PROGRESS OF THE PEOPLE CALLED QUAKERS.

(Continued from page 150.)

The summer of the same year was memorable for the landing of Francis Howgil and Edward Burrough, two able, eminent Preachers of the Gospel of Peace: they had great service in Munster, several receiving their testimony and adhering to the doctrine they preached. It was therefore resolved that they should not be suffered to stay long in Ireland, but by an order from the Government at the instigation of the priests they were taken prisoners in Cork, and sent by a guard from garrison to garrison to Dublin in order to be banished. They had no meeting in Dublin, yet had some service for the Lord with those that came to see them, being confined to the house of — Mortimer, Sergeant at Arms, and after some time were in a violent manner haled a ship-board and banished for England.

And first of the service of the said Francis Howgil at Bandon, where he was received by Edward Cook, (a man of great parts, a Cornet of Horse in Oliver Cromwell's own troop, and Receiver to the Lord Cork,) who also went with him on a first day of the week to the public worship house at Bandon, where the said Francis having declared truth amongst the people, Edward Cook invited them to come to a meeting to be held at his house that evening, where there was a great concourse of people, to whom Francis preached the Gospel, and opened the way of life and salvation, and many confessed to the truth of what he declared and joined in society with Friends.

Concerning the aforesaid Edward Cook the following testimony is left us: "He embraced the truth with his whole heart, and retained it, was given up to serve the Lord, and lived and walked under the cross of Christ Jesus, in great self-denial to the world and the glory and greatness of it, to his dying day, and laid down his head in peace with God, and sweet unity with true-hearted Friends."

On the 7th day of the week Edward Burrough and Francis Howgil, and with them James Sicklemore and Edward Cook, went to Limerick, and next morning to the public place

of worship, and after some time, attempting to speak, were run upon by the people, and next day put forth thro' the gates by order; and as they rode along, Edward Burrough preached thro' the streets on horse-back, and without the gates had an opportunity of speaking to a great multitude that followed, as also Francis Howgil, James Sicklemore, and Edward Cook spoke a few words, the tendency of which was to direct the people to Christ Jesus, a measure of whose light was given to every one to profit withal. These acceptable tidings of the gospel of peace took place with Thomas Phelps, Richard Pearce, John Love, &c.

Divers also were convinced the same year at Kinsale by the ministry of the aforesaid Edward Burrough and Francis Howgil, and among the rest Susanna Worth, wife of Edward Worth; afterwards Bishop of Killaloe, who, tho' she suffered much from her husband, lived and died in unity with Friends.

In process of time it came to pass that those convinced, being more enlightened in their understandings, met together in silence, and also became concerned to bear a testimony to the truth against the world's fashions and manners; and their words, habits and deportment made them a reproach, and brought them into sufferings, as imprisonment, &c. Nay, the magistrates did publicly forbid the people to buy any thing of Friends, and particularly of Richard Pearce, apothecary in Limerick; and this suspension continued on him several months, but he regained his business and followed it with reputation the rest of his days. He was the first in Limerick that received Friends into his house where meetings were kept for many years, and was succeeded by his son Thomas Pearce both in his outward and in his inward calling. But to return to Edward Burrough; besides divers places in Munster, he visited Kilkenny, where he labored in the gospel, and several were convinced and a meeting was settled there and kept up several years: but William Mitchell and his wife fell into some wild imaginations, and George Danson and his wife into quarrelling, and so the meeting came to be lost, yet one ancient woman, by name Esther Beaver, continued faithful to her dying day, who received Friends that came to visit said place, and meetings were many times kept there afterwards.

In order that my reader may form some idea of the spirit and character of the aforesaid Edward Burrough, I shall here insert the substance of two papers written by him, breathing forth the spirit of evangelical liberty, viz.

"To the Judges and Justices and all that handle the law."

"Christ Jesus is the light of the world,—by which every one of you is lightened, which light if you love and be guided by, it will lead you out of the world's ways, nature and unrighteous-

ness, and will give you an entrance into everlasting life—and in this world it will teach you how to serve God in righteousness in your generation, and to give righteous judgments and counsels among your brethren without respect of persons. None can rule for God but who are ruled by him, with his light that shines in the conscience, by which you being governed, will by it govern in the earth righteously. You are not to judge for gifts and rewards, for if you do, you judge not for God, but for yourselves, and you and your judgment is to be judged and condemned with the righteous law of God, which is free; but such who fear God and hate covetousness, and gifts and rewards, are to bear rule, and such will handle the law righteously, and be a terror to evil doers, and will stand for the praise of them that do well. But if such bear rule and handle the law which know not God nor are ruled by him, these will abuse the law, and be a terror to righteousness and good works, and will strengthen the hands of evil-doers, and will let vice and wickedness escape unpunished.

“The law was added, to slay unrighteousness, against the disobedient and lawless; but it was not made for the righteous, whose consciences are exercised towards God and towards man by the pure law of God written in the heart. If you make a law in your own (carnal) wills, and judge by such a law, then you will make the innocent suffer, and oppress them who walk in the law of God, and in the exercise of a pure conscience:

the saints in all generations were persecuted by such laws which were made in the will of man, contrary to the will and law of God:—So take heed what you do, and know your place and the length and breadth of your law, which is committed to you, which is to keep the outward man in good order, and the nations in peace and truth, and from theft, and murder, and adultery, and quarrelling, and drunkenness, and wronging one another, and such like: such who act these things walk contrary to the light, and so bring themselves under the penalty of the law, but over the inward man your law, which is outward, hath no power to limit, to tie to or from any way of worship in religion; but let religion defend itself, and lay not your law upon the conscience to exercise dominion over it, (for it is Christ's seat in which he will rule) lest you be found tyrants and numbered for destruction; nor limit the Spirit of the Lord, how, when, where and by whom it must speak; for the holy men of God in all ages ever cried against such rulers as did judge false judgment, and for gifts and rewards, and against such priests and prophets as preached for hire and divined for money, and sought for their gain from their quarter, and through covetousness made merchandise of souls: therefore be ye warned, if such you uphold, by a law, who act such things which the Scripture declares

against; the Scripture which you profess will stand a witness against you, and the law of God will condemn you, and God will lay your honor in the dust and cast you out of the seat of judgment: but judge the cause of the poor and needy, of the widow and fatherless, and join mercy with judgment, and lay your swords upon oppression and all tyranny and wrong dealing, that the land may be cleansed of evil-doers, and equity and righteousness may flow down, and the nation in good order may be kept, in peace and righteousness, and so God will establish you among his children, who are taught of him alone, and are far from oppression.” Written at Dublin the 23d of the 8th month, 1655, by Edward Burrough.

(To be continued.)

SWEET OLD AGE.

God sometimes gives to man a guiltless and holy second childhood, not childish, and the faculties in full fruit and ripeness, are mellow with a sign of decay. This is that thoughtful land of Beulah, where they who have travelled manfully the Christian way, abide awhile to show the world a perfect manhood. Life, with its battle and its sorrows, lies far behind them; the soul has thrown off its armor, and sits in an evening undress of calm and holy leisure; thrice blessed the family or neighborhood, that numbers among it one of those not yet ascended saints; gentle are they and tolerant, and apt to play with little children, easy to be pleased with little pleasures.

REFLECTIONS ON A MEMOIR OF CLEMENTINE CUVIER.

Reader, you have now perused this short but interesting memorial of the young, the beautiful, the pious Clementine Cuvier; and while the heart is softened to receive, I would hope, the impression of religious truth, may I solicit your serious and devout attention to the lessons with which the narrative is fraught.

FIRST—*Does it not most impressively remind us of the VANITY OF THE WORLD; and that in two points of view, its insufficiency to make us happy, and the uncertainty of its continuance?*

“Vanity of vanities, all is vanity and vexation of spirit.” With such a confession did the man go off the stage of existence, who of all the human race was the best qualified to give an opinion upon such a subject. If the possession of royalty, unbounded wealth, peace, surpassing wisdom, and all the sources of sensual gratification, could satisfy the desires of an immortal soul, then had not Solomon been compelled by experience to reduce the sum total of the world's power of giving happiness to two mere cyphers,

and pronounce it to be nothing but vanity and vexation.

And now hear the testimony of another, "by whom the world with its fashions and its follies, its principles and its practices, has been proposed in form to Englishmen, as the proper object of their attention and devotion. Lord Chesterfield has avowed as much with respect to himself, and by his writings said in effect to it, 'Save me, for thou art my god.' He has tendered his assistance to act as priest upon the occasion, and conduct the ceremonial. At the close of life, however, his god he found was about to forsake him, and therefore was forsaken by him. You shall hear some of his sentiments and expressions, which have not been hitherto, so far as I know, duly noticed and applied to their use; that of furnishing an antidote, and they do furnish a very powerful one, to the noxious positions contained in his volumes. They are well worthy your strictest attention.

" 'I have seen,' says this man of the world, the silly rounds of business and pleasure, and have done with them all. I have enjoyed all the pleasures of the world, and consequently know their futility, and do not regret their loss. I appraise them at their real value, which is in truth very low; whereas those who have not experienced always overrate them. They only see their gay outside, and are dazzled with their glare; but I have been behind the scenes. I have seen all the coarse pulleys and dirty ropes which exhibit and move the gaudy machines; and I have seen and smelt the tallow candles, which illuminate the whole decoration, to the astonishment and admiration of an ignorant audience. When I reflect back upon what I have seen, what I have heard, and what I have done, I can hardly persuade myself that all that frivolous hurry, and bustle, and pleasure of the world, had any reality; but I look upon all that has passed, as one of those romantic dreams which opium commonly occasions; and I by no means desire to repeat the nauseous dose for the sake of the fugitive dream. Shall I tell you that I bear this melancholy situation with that meritorious constancy and resignation which most people boast of? No; for I really cannot help it. I bear it because I must bear it, whether I will or no. I think of nothing but killing time the best way I can, now that he has become mine enemy. It is my resolution to sleep in the carriage during the remainder of the journey.'

"When a Christian priest speaks slightly of the world, he is supposed to do so in the way of his profession, and to decry, through envy, the pleasures he is forbidden to taste. But here, I think, you have the testimony of a witness every way competent. No man ever knew the world better, or enjoyed more of its favors, than this nobleman. Yet you see in how poor, abject,

and wretched a condition, at the time when he most wanted help and comfort, the world left him, and he left the world. The sentences above cited from him compose, in my humble opinion, the most striking and affecting sermon upon the vanity of the world, ever yet preached to mankind."

Such was the confession, in his old age, to a son that afterwards died by his own hand, of Lord Chesterfield, the oracle of English gayety and manners.

It were easy to cite testimonies to the vanity and insufficiency of the world from writers, compared with whose purer, brighter fame, that of Lord Chesterfield is but as the spark of an extinguished candle, sending forth smoke and an intolerable odor to the light of the morning. Sir James Mackintosh, one of the most accomplished men and elegant writers of modern times, in speaking of Madame de Stael, that extraordinary woman, who astonished all Europe by her writings and her conversation, observes, "Placed in many respects in the highest situation to which humanity can aspire: possessed, unquestionably, of the highest powers of reasoning; emancipated in a singular degree from prejudices; and entering with the keenest relish into all the feelings that seemed to suffice for the happiness and the occupations of philosophers, patriots, and lovers, she has still testified, that *without religion there is nothing stable, sublime, or satisfactory; and that it alone completes and consummates all to which reason and affection can aspire.*" What a confession from one whom the greatest monarchs of Europe either feared or courted, and who lived amidst the applause of all the rarest minds on earth at the time: Yet she found the world a broken cistern, and turned at last to religion as the only fountain that could satisfy the cravings after happiness which are felt alike by the greatest and the least of the human race. If all the brilliant scenes which the world presented to this wonderful woman proved to be phantoms, and ended in vanity, what has it to offer that can satisfy ordinary minds?

Precisely the same thing happens in savage as in civilized life, for the soul of man is everywhere the same in its desires and disappointments, as long as things seen and temporal are the highest objects of its ambition. An old man in Siberia, once said to a missionary, "I will state to you a case, and request your opinion of it. There was a man who, during a long life, wished to enjoy many things, and many of his desires were granted: he wished to have sons, and sons were given him; to have grand-children, and his eyes have seen them; to be admitted to the feasts and assemblies of the people, and he was gratified with these; to enjoy the pleasures of the chase, and he was a successful hunter; he sought increase of riches, and his cattle multi-

plied; he wished for length of days, and he is now an old man. But now he has nothing more to wish or hope for in life, for the day of death cannot be far off. He has done with feasting, and travelling, and hunting, and making rich, and now he wishes to know if he may without making any noise about it, simply worship the God of heaven, without avowing himself a Christian, and give up the worship of the temple gods, but make no formal abjuration of them!"

How near akin to the experience of Solomon, the wisest and richest of men, as described in the book of Ecclesiastes, was that of the poor savage here described; how like to both these was the feeling of Madame de Stael and Lord Chesterfield; how consentaneous is the testimony of them all with the universal sentiments of mankind; and how clearly and fully does the experience of the human race attest, that there is a void in the heart of man which nothing but religion can fill, and a yearning which nothing else can satisfy.

But perhaps the history of Clementine Cuvier will furnish an illustration of the emptiness of the world, far different in kind from these, but as likely to impress a young heart as any that could be brought forward. Observe her situation, and mark the rare combination of circumstances which it presented, to delight and fascinate an ardent mind. Think of the celebrity of her illustrious father, whose political offices and philosophical researches drew around him all the most distinguished men of France, and made his home one of the Parisian centres of intellectual and national greatness; think of those personal accomplishments and mental acquirements which excited the admiration and interest of all who knew her; think of the respect and attachment of the humane and religious, whose schemes she supported, and whose institutions she patronized; add to this the gratitude she perpetually received from the persons whose wants she had relieved; and to crown all, think of the attachment of her lover, and the prospect of her marriage, and you will then perceive that the world, invested with its brightest and purest glory, stood before her in a form best adapted to captivate a pure and youthful mind, and compel it to say, "'Tis enough; I am satisfied it is good to be here." But *did it satisfy her mind? Did it fill her heart, and leave her nothing more to wish for?* No. Her memorialist tells us, that "*surrounded as she was by all the enjoyments and illusions of this world, she was only happy as she was conversant with the spiritual and substantial blessings of the kingdom of God.* She FELT THAT SHE MUST LOVE AN INFINITE OBJECT, AND THAT CHRIST ALONE COULD FILL THE SOUL." Even to *her* the world was nothing more than a broken cistern, that could hold no water, and she thirsted, panted, and looked round for the fountain

of living water, and found it—IN RELIGION.

Reader does the world satisfy *you*? Perhaps you are a votary of worldly pleasure, and found at all its gay resorts; if so, let me ask you whether there are no occasional feelings of dissatisfaction; no craving after something better; no surmisings that this is a scanty portion for a rational and an immortal mind to live upon; no seasons of envy and disappointed ambition; no felt resentments of a soul finding out that it is mocked with the shadows of happiness instead of the substance? Does not a time of reflection come, when, after the music is silent, the party is scattered, and all the gay pageantry is passed away, and you are alone, the mask drops from the world, and the gay deceiver stands before you a detected impostor, a convicted liar? Are there not seasons of *ennui*, when, under the influence of satiety and disgust, you exclaim in bitterness, "Yes, it is all vanity; the Preacher has *said it*, and I *feel it*." Do you not find, at times, that *you* also want an *infinite* object for the affections, which shall yield, not drops to tantalize, but ever flowing streams to satisfy; a fountain, a "river of life, clear as crystal?" Hear then the words, listen to the invitation of the prophet: "Ho, every one that thirsteth, come ye to the waters, and he that hath no money; come ye, buy wine and milk without money and without price. Wherefore do ye spend money for that which satisfieth not? Hearken diligently unto me, and eat ye that which is good, and let your soul delight itself in fatness."

So uncertain, and therefore so vain, are the promises, so deceptive the smiles of the world. O who would hang their best and fondest hopes on the brittle thread of life? Who that is wise will stake their chief happiness on a beating pulse? "The voice said, Cry; and he said, what shall I cry? All flesh is grass, and all the goodness thereof is as the flower of the field; the grass withereth, the *flower fadeth*, because the Spirit of the Lord bloweth upon it. Surely the people is grass."

Even granting, then, that you enjoy the world, and that it has performed all its promises, and left you nothing to wish, but that things should remain as they are, how do you know that they *will* remain as they are? "What is wanting here?" said a courtier to his sovereign, with whom he was riding amidst the acclamations and splendor of a triumphal procession. "Continuance," replied the monarch. So say I. Tell me, if you will, of your youth, your health, the buoyancy of your spirits, your happy connections, your gay parties, your elegant pleasures, your fair prospects; and then ask me what is wanting. I reply, "Continuance." A single day may spoil everything; before to-morrow's sun shall rise you may be attacked by disease and death. You know not what an hour may

bring forth. Turn then for happiness from the world to religion, this is both satisfying and certain. Nothing can rob you of its privileges; they are vast as the capacity of your soul, and lasting as your eternal existence. Hear the beautiful language of Christ: Whosoever drinketh of the water that I shall give him, shall never thirst; but the water that I shall give him, shall be in him a well of water springing up into everlasting life." John 4: 14.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIFTH MONTH 28, 1859.

MARRIED, On the 18th inst., with the approbation of Horsham Monthly Meeting, at the house of Rebecca Wood, M reland Montg. Co., BARCLAY J. SMITH, of Lewisville, Bucks Co., to LYDIA ANN WOOD, of the former place.

DIED, of cancer, at Galway, Saratoga Co., N. Y., 29th of 1st mo., 1858, MARTHA, wife of William Wilber, in the 79th year of her age. She had lost her eyesight many years previous to her death.

She bore her afflictions with Christian patience, evincing that her day's work was done in the daytime. She was a member of Galway Monthly Meeting.

—, At Greenfield, Saratoga Co., N. Y., in 9th mo. last, at the residence of her son-in-law, RHODA GIFFORD, in the 89th year of her age.

She was for many years a minister. She has frequently been heard to say, "she was waiting the Master's time." It can truly be said of her "blessed are the dead that die in the Lord, from henceforth, yea, saith the spirit, that they may rest from their labors, and their works do follow them." She was a member of Deruyter Monthly Meeting.

—, At Galway, 9th mo. last, ABAGAIL THORN, in the 91st year of her age,—a member of Rensselaerville Monthly Meeting.

CHEERING PROSPECT FOR IRELAND.

There is hope for Ireland, poor, down-trodden, priest-ridden Ireland. The great changes that have taken place during the past year in that "green isle of the ocean," seem to be preparing the way for its moral regeneration. With the exception of Ulster, the northern of its four provinces, which, since the time of Cromwell has been Protestant, having been largely settled by Scotch Presbyterians, the island has been under the dominion of the papacy. Ulster, with about a fourth of the area of the island, has nearly a third of its population, and for two hundred years has been the most prosperous portion.

Before the great famine in 1857, the population was over eight millions, of which five were probably Roman-catholics. The great mass of those who perished then, and of those who have since emigrated in such large masses, have been Romanists. In consequence of the passage by

the British Parliament of a bill for the Relief of Encumbered Estates, by which proprietors of estates that had been held by entail were allowed to sell their land, many great estates which had been neglected—their owners generally living abroad, leaving the collection of their rents to rapacious agents—were cut up into small farms and sold to English and Scotch farmers, who have been mainly Protestants.

Not only has this caused great material improvement to the Island, but the unexpected fact now appears, that fully one half of its present population are Protestants, there being more than three millions of Protestants, while the whole population is about six millions. The west and south are beginning to resemble the north of the Island, and the whole aspect of the country has changed. Schools and churches where the true gospel is preached, the labors of the Bible-readers, and missionaries, accompanied by the powerful influence of busy industry that always distinguishes Protestant lands where the gospel is free, from those where independence and enterprise with the right of private judgment are crushed by priestly despotism, must soon produce their effects; and though the opposition of Romanism may become more determined and formidable than ever, truth must prevail, and that beautiful Emerald isle yet be still more beautiful through the influence of enterprise and education, the fruits of religious liberty.—*American Messenger.*

Extracts from the Minutes of the Yearly Meeting of Friends, held in Philadelphia, by adjournments, from the ninth day of the Fifth month, to the 13th of the same inclusive, 1859.

At the Yearly Meeting of Friends held in Philadelphia by adjournments from the ninth day of Fifth Month to the thirteenth of the same, inclusive, 1859.

Reports were received from the various branches of this Yearly Meeting, by which it appears that representatives were appointed to attend the service of the meeting, who were all present except five; for the absence of three of whom reasons were assigned.

Minutes for Friends in attendance from within the limits of other Yearly Meetings were read.

One for Nicholas and Margaret Brown, ministers, from Pickering Monthly Meeting, Canada West, dated 23d of Ninth month, 1858—endorsed by Canada Half Year's meeting, 27th of same month.

One for David H. Barnes, a minister from Purchase Monthly Meeting, dated 13th of Fourth month last.

One for Solomon Haviland, an elder, and companion for David H. Barnes, from the same meeting, of the same date.

One for Richard Cromwell, a minister from the Monthly Meeting of New York, dated 4th inst.

One for Joseph Branson and Tacy Branson, elders, from Hopewell Monthly Meeting, dated 5th inst.

One for Israel Drake, a minister, from Rensselaerville Monthly Meeting, dated 28th of 4th month last.

One for Cyrus and Mary Ann Griest, elders, from Monallen Monthly Meeting, Adams county Pa., dated 4th month 20th last.

One for Daniel Starbuck, an elder, from Troy Monthly Meeting, dated 4th inst.

One for Israel Tennis, an elder, from Little Britain Monthly Meeting, dated 16th of 4th month last.

Epistles from our brethren at their last Yearly Meetings of New York, Baltimore, Ohio, Indiana, and Genesee, were read, to our edification and comfort. A Committee was appointed to prepare communications thereto as way may open, and they are further requested to propose a Friend to serve as Recorder, to record epistles received and issued by this meeting, and also memorials of deceased Friends, in place of Joseph Warner, who now requests to be released.

Second day, afternoon.

James Mott, on behalf of the representatives, reported that on conferring together, they were united in proposing William Griscom, as Clerk, and Dillwyn Parrish, as assistant Clerk, which being united with, they were appointed to the service.

The representatives who were not present at this morning's sitting, were now called, and two of them answered to their names.

Minutes introduced from Women's meeting were read.

One for Jane Drake, an elder, and companion of her husband, Israel Drake, from Rensselaerville Monthly Meeting, dated 28th of 4th month last.

One for Edith Griest, a minister, from Monallen Monthly Meeting, Adams county, Pa., dated 4th month 21st last.

The following epistle from our aged and beloved friend, Samuel Comfort, was read and directed to be placed on our minutes:

To the Yearly Meeting of Friends, to be held in Philadelphia, in Fifth month, 1859.

DEAR FRIENDS, Brethren and Sisters in the Covenant of Life and Peace: May grace, mercy and peace be multiplied amongst you, and abound.

I have enjoyed the privilege of assembling with you in Yearly Meeting for many years, but now the infirmities of body often attending old age, seem to point out the propriety of remain-

ing at home this time; yet my love to Friends, and the abiding interest I have ever felt in the blessed cause of Truth, and in the Christian testimonies which the Society of Friends has been called upon to bear, is undiminished.

I may adopt the language of an Apostle to the Christians of that day: "Therefore, my beloved brethren (and I may add sister-), be ye steadfast, unmovable, always abounding in the work of the Lord, forasmuch as ye know that your labor is not in vain in the Lord." Thus much I feel free to write; and with desires for the present and future welfare of all, and that the children and youth, young men and young women, may be found walking in the truth, and therein abide, I remain your friend and fellow-laborer.

SAMUEL COMFORT.

Near Morrisville, Bucks Co., Pa., 4th mo. 29, 1859.

Third-day Morning.

The Meeting was engaged in the consideration of the Answers to the first Query, and in the afternoon the state of Society, as brought into view by the answers to the second, third and fourth queries, claimed attention. There was much exercise and expression of concern, in which Friends were encouraged to faithfulness in the several testimonies embraced therein.

Fourth-day.

The answers to the fifth and sixth queries were considered, and occupied the sitting that morning.

In the afternoon, the answers to the remaining queries were deliberately considered.

Answer to the First Annual Query.

Philadelphia Quarter reports that the time for holding afternoon Meetings at Green street, has been changed to 7½ o'clock, from the first First-day in the Fourth month to the first First-day in the Tenth month; and to 7 o'clock the remainder of the year. The afternoon Meetings for worship at Spruce street, have been suspended for the ensuing sixth, seventh and eighth months, inclusive. Philadelphia Quarterly Meeting has concluded to hold all its sittings, and those of the Quarterly Meeting of Ministers and Elders, at the new house on Race street.

Abington Quarter informs that Gwynedd Preparative Meeting has changed the time of holding their Preparative and Week-day Meetings, from the third to the fifth day of the week.

Concord Quarter informs that Willistown Meeting has changed its time for gathering, from 11 to 10 o'clock, throughout the year. Stanton Meeting has changed the hour for gathering in the winter season, from 11 to 10 o'clock. The Mid-week Meetings held at Wilmington and Stanton, in the week of the Quarterly Meeting at Wilmington, have been discontinued.

Southern Quarter informs that a change has

been made in the time and place of holding the Select Meeting in the Second and Eleventh months. It is now held at Camden, at 3 o'clock in the afternoon of the day next preceding that of holding the Quarterly Meeting at little Creek; also, that Camden Monthly Meeting, held in the Fifth month, is changed to the second day following the third first day.

Burlington Quarter informs that East Branch Preparative Meeting, has been discontinued; also, the Mid-week Meeting at *that place*, for the week of Chesterfield Preparative Meeting; and the Meeting for Worship on the first first day of each month, changed from the morning to 3 o'clock in the afternoon.

Haddonfield informs that Easton Meeting, a branch of Evesham Monthly Meeting, is discontinued.

Bucks Quarterly Meeting informs that the name of "Kingwood Monthly Meeting of Friends" has been changed to that of "Quakertown Monthly Meeting of Friends, New Jersey."

Answer to Second Annual Query.

There are forty-six Schools, superintended by Committees of the Monthly or Preparative Meetings, thirty-eight of which are taught by members. The pupils of eighteen of these Schools are reported as attending Mid-week Meetings, with their teachers.

The minutes of the Representative Committee, or Meeting for Sufferings, were read, and their labors were satisfactory.

The interesting subject of education claimed attention, and a lively concern prevailed that Friends may be encouraged to give their children a *guarded, religious education*, and that we may not feel that the provision now made for the support of public schools absolves us from the duty of maintaining our own.

Thirteenth of the month and sixth of the week.

A memorial of our deceased friend Isaac Parry, an Elder from Horsham Monthly Meeting, approved by Abington Quarterly Meeting, was read, approved, and directed to be recorded.

The following minute, embracing some of the exercises of this meeting, was read and united with:

While considering the various important subjects which have been presented by the reading and answering of the queries, we have been comforted by the company of a large number of the middle aged and young, whose silent exercise of spirit has contributed to the strength of the body, and to the support of the Ark of the testimony. We believe that many of these have experienced a renewal of their spiritual strength, and a renewed qualification to labor effectually in building up the waste places. As in the days of the primitive believers, so now there is a diversity of gifts and various degrees of religious experience, but with those who keep under the cir-

cumscribing influence of the light of Christ in the soul, there need be no conflict. Each will seek to know and occupy his position in the militant church, and all will move forward in that harmony and love which ever distinguishes the followers of Christ, and can only gather to his fold. All the difficulties and dissensions which have divided and subdivided the Christian Church have grown out of a departure from the simplicity of the truth, as taught by our Divine Law-giver. We were made to feel that we could promote the righteous testimonies given us, as a people, *only* as we become humble and obedient, subject to, and under the influence of his teaching, which will teach us *individually* all things necessary to be known pertaining to our duties in this life.

Deficiencies continue to be reported on account of the neglect of many of our members in the attendance of religious meetings, particularly those held near the middle of the week. It was painful to feel that the love of the world and the deceitfulness of riches had choked the word in too many, and prevented that growth which might otherwise be experienced in the performance of this religious obligation. We were reminded that the duty of often meeting together for the purpose of social divine worship had been recognized in every period of the Christian church, and when thus assembled, as we seek for a right qualification, we shall often be favored, even though not a word be spoken, with the Divine presence, which will refresh our spirits and bind us together in the bonds of Christian fellowship.

Love and unity would thus be maintained, and the spirit of tale-bearing and detraction eradicated from our minds. Dwelling under this feeling, we should be qualified to bring up our children in the simplicity which the truth leads into, and would frequently be enabled to draw them around us in silent waiting upon the Lord.

The subject of spirituous liquors, as embraced in the fourth query, produced much exercise, in which encouragement was extended to faithfulness in the support of our testimony in relation thereto. Earnest appeals were made to all, and particularly to those in the younger walks of life, to increased watchfulness against this insidious enemy:—that they should avoid all places of resort where the intoxicating draught is presented, and also the deceitful allurements of the world which, under the promise of pleasure, lead down to the chambers of death. Let our young men "watch and pray, lest they enter into temptation."

The great national evil of slavery, and the recent attempts which have been made to re-open the foreign slave trade, was felt to be as a dark cloud hanging over our beloved country, and the rumors of war in a foreign land have clothed our spirits with sadness. We earnestly desire that

the members of our Society may embrace every right opening in the advocacy of these testimonies, and that we may live in a spirit which will show by its fruits, that we are the followers of the Prince of Peace.

While we desire to cultivate charity towards our fellow professors of the Christian name, we should remember that our forefathers suffered much in the maintenance of a testimony to a free gospel ministry.

The efforts which are still making by those who claim to be the spiritual leaders of the people, call loudly upon us to maintain a testimony against the machinery of priestcraft in all its specious appearances.

To assist the clerks in printing and distributing the extracts, and in transcribing and forwarding the epistles, a committee was appointed.

Having again been permitted to assemble in the capacity of a Yearly Meeting, and favored to transact the business in harmony and condescension, one to another,—with desires that we may all be renewedly concerned to walk in humble obedience, we conclude, to meet at the usual time next year, if consistent with the Divine Will.

Extracted from the Minutes.

WILLIAM GRISCOM, Clerk.

MARKS OF THE CHRISTIAN.

In proportion as the heart becomes sanctified there is a diminished tendency to enthusiasm and fanaticism; and this is undoubtedly one of the leading tests of sanctification. One of the marks of an enthusiastic and fanatical state of mind, is a fiery and unrestrained impetuosity of feeling; a rushing on, sometimes very blindly, as if the world were in danger, or as if the great Creator were not at the helm. It is not only feeling without a good degree of judgment, but, what is the corrupting and fatal trait, it is feeling without a due degree of confidence in God. True holiness reflects the image of God in this respect as well as in others, that is calm, thoughtful, deliberate, immutable; and how can it be otherwise, since rejecting its own wisdom and strength, it incorporates itself into the wisdom and strength of the Almighty.

Where there is true Christian perfection, there is always great humility; a Christian grace, which it is difficult to define, but which implies at least a quiet and subdued, a meek and forbearing spirit. Whatever may be our supposed gifts and graces, whatever may be our internal pleasures and raptures, they are far from furnishing evidence of the completeness of Christian character without humility. It is this grace, which, perhaps more than any other, imparts a beauty and attractiveness to the religious life; and which, while it is blessed with the favor and approbation of God, has the additional efficacy of disarming,

in a considerable degree, even the hostility of unholy men. It has the appearance of a contradiction in terms, but it is nevertheless true, that he who walks in humility walks in power.

One of the surest marks of sanctification is an increased sensitiveness to sin in all its degrees. The slightest sin is a source of unspeakable misery to the sanctified heart; and gives the soul no rest till it is washed out in overflowing tears of penitence.

The height and sum of religion is to bear the image of Christ. But can those flatter themselves that they bear the Savior's image, who are overcome and are rendered impatient by every trifling incident of an adverse nature? O, remember that the life of Christ was from beginning to end a life of trouble. He was often misunderstood and ill-treated by all classes; he was persecuted by the Pharisees; sold by the traitor whom he had chosen as one of the disciples; reviled by the thief on the cross; put to death. But he was far more desirous of the salvation and good of his enemies, than he was of personal exemption from their persecutions." "Father, forgive them, they know not what they do."

TANNER'S LECTURES.

(Continued from page 152.)

I do not know that I have much occasion to regret having but a short space to devote to the *middle period* of our history; for in the experience of the Society of Friends, as in that of other religious sects, and of the Christian Church at large, the middle period was one of spiritual darkness and depression. If the first period of our Society was not in all respects a golden age, it was an age of zeal and love; and the Christian devotedness of its members was the means of attracting many to the beauty of holiness. The large additions made to their numbers from time to time were probably not restricted to the period of persecution; but I do not think that any large in-gathering took place in the southwestern counties after the close of the seventeenth century. There does not appear to be any means of ascertaining the number of those who attended the different meetings at that time. The number of marriages was very large; scarcely a month passed without one or more intentions of marriage being brought before the Bristol meeting. This may be partly accounted for by the liberty to marry at meeting being generally accorded to the attenders of meetings whose conduct was orderly, and not restricted, as of late, to those who are formally recognized as members; but I do not think that this fully accounts for so many more marriages having taken place then than now. It is very probable that in the more simple state of society which then existed, prudential considerations had less influence in

restraining marriage than is at present the case.* In Bristol, the meeting-house accommodation was probably greater than at present; but it is impossible to ascertain to what extent the meetings at the Friars, and in Temple Street, were attended by the same persons.

In the description given of our Society history by Joseph Bevan Braithwaite, at the commencement of the second volume of J. J. Gurney's Memoirs, he remarks on the extent to which traditional belief and formal profession marked the successors of the early Friends. And I have met with abundant evidence that this representation was fully applicable to the state of things in this part of the country. Before the close of the seventeenth century, many of the meetings for worship, held in the middle of the week, were, "either totally neglected," or had "in a great measure declined." To this succeeded a deficient attendance at First-day Meetings. In some places in the west of England, no meeting was held before one o'clock on First-day, and where two meetings were held, the first was often poorly attended, the reason being that Friends were busily occupied with their worldly callings.

The undue spirit of worldly gain may be considered as having stood in the relation of both cause and effect to the low spiritual condition with which it became connected; and there were, doubtless, many things which conspired to lay the members of our Society peculiarly open to such a snare. Amidst the opposition which at first arose against Friends, in all directions, the earning of a livelihood was often a matter of great difficulty: but their neighbors were not long in perceiving that, however mistaken they might be in some of their views, they were (generally speaking) honest and true-hearted men, whose word was their bond. They could send their children to the Quaker's shops with a certainty that they would be as well served as they would have been themselves. The old proverb that "honesty is the best policy" was not long in being verified by the success which attended the commercial undertakings of many of the early Friends. Then, again, whilst they gave up a great deal of time to the attendance of their meetings and other church services, their diligence in following their business was not interrupted by the frivolous pursuits and amusements in which many of their neighbors indulged. They were ready to distribute their substance for the benefit of others, notwithstanding their own losses, to an extent which might well surprise us, were it not that one of the benefits of suffering is the effect which it produces in opening the heart towards other sufferers; but on the other hand their personal habits were very simple. Neither their furniture, dress, nor food, was of an expensive kind.

In these, and in other ways, a foundation was

* In many of our meetings the number of deaths has exceeded the number of births, for many years past.

laid for the accumulation of wealth to an extent which it was not easy to foresee. Still more difficult was it to perceive the effects which such accumulation would produce upon individuals, and upon the general state of the Society. There are, however, indications given, in some of the documents issued in very early times, that the danger of which I speak was by no means overlooked. It certainly does not form any part of the business of the Church to define the extent to which it is right for its members to accumulate wealth; and it is a matter of no small difficulty for individuals to set a limit for themselves; but I believe that our Society, in common with other Christian bodies, would have derived benefit from a clearer recognition of the principle, that Christians should cease to accumulate wealth when they have reached the point at which conscience tells them they have enough. If the rule which Richard Reynolds laid down for himself, of spending his income year by year, had been more generally followed by those of our members who had obtained a competence, there is great reason to believe that important benefit would have accrued both to themselves and their families. Many names occur in the early Bristol minutes which have since been identified with the commercial prosperity of the city, but which are no longer recognized as having any connection with Friends.

There is one result of the increase of wealth among Friends in Bristol, of which we cannot complain. I allude to the erection of this comfortable and commodious meeting-house. The first house built on these premises cost £655, whilst the second, which was built in 1747, cost £1830. Even the latter sum would now appear small; and I should be one of the last to object to this large expenditure, seeing how greatly the convenience of Friends was consulted in the building of this house; and being disposed, as I am, to think that the interior is a good specimen of chastened and correct taste.* To glance for a moment at a more recent outlay of money on these premises, which of us does not feel pleasure in recalling the fact that, in the year 1845, the sum of £700 was expended in the purchase of the Cutlers' Hall, the old dormitory of the monks, and that a further sum of £972 was spent in restoring and adapting it to the use of our day, and First-day schools for boys.

But I must make further reference to the unwelcome subject of the *declension* which marked the second period of our history. It was alike observable, in town and country; and although the indications of it were somewhat different, worldly-mind-

* John Clark, of Bridgwater, who was well versed in architecture, used to say that this interior would have been a perfect specimen of its style—the Roman Doric—if the bases of the pillars had been square instead of octagonal; and it appears from a minute of the building committee, which directs the cutting off the corners, that they were originally square.

edness was as much evinced by the exclusive devotion which some gave to their farms, as by the zeal with which others followed their merchandize. Not only were the meetings for worship neglected, but in regard to every branch of our Christian profession unfaithfulness appeared. The increase of wealth was found, as in so many other cases, to impede rather than assist, the exercise of *charity*. Complaint was made to the Quarterly Meeting of Somerset, in 1740, of the deplorable circumstances of poor Friends in divers parts of the county; and an epistle was sent to the Monthly Meetings recommending a more charitable disposition on the part of Friends of ability.

In 1742 mention is made of the underhand payment of *ecclesiastical demands*, which the Quarterly Meeting considered to be only "deceit." Our testimony against *war* was compromised in a similar manner—subscriptions being entered into by many Friends for providing substitutes for such as were called upon to serve in the militia. Dealing in smuggled goods is also mentioned in the Quarterly Meeting minutes. The simplicity of *dress*, by which the early Friends were distinguished, was exchanged for the extravagancies then in fashion. James Gough, who came to Bristol in 1728, says that his plain dress caused him to appear like "a speckled bird;" and the father of the late J. S. Fry, who settled here about 1748, found only two young men in the meeting who dressed plainly. Samuel Emlen is said to have addressed himself, in one of his sermons, to the "powder-pated beaux."

Church discipline and oversight had suffered, at least, as great a decline as the conduct of the members. In 1757 the Somersetshire Meetings are stated to have been altogether deficient as to the appointment of overseers.* Wrong doers were allowed, in many instances, to continue a nominal connexion with the Society: whilst, in others, the discipline was exercised, but with less of Christian forbearance than formerly. I have met with many cases in which persons were disowned, without having received, as far as can be learnt from the minutes, a single official visit. The love of souls and the desire to reclaim the wanderer, seem to have given place to the notion of maintaining the credit of the Society. Testimonies of disunion were issued, "forthwith," against persons of disreputable conduct: and one Friend was disowned because he refused to fasten a copy of his declaration of repentance to the market-cross of the town in which he lived.

In such a state of things it need not surprise us, that the select character, before referred to, as having been given to the Meetings for Discipline, was found to be injurious in its operation; and that, in many cases, the place of the "nursing fathers," came to be filled by such as must rather be described as "lords over the heritage."

* Quarterly Meeting Minutes.

The Somersetshire Meetings being held in private houses, were the more liable on that account to be restricted to particular cliques and classes. In 1748, I find the *Quarterly Meeting* adjourned to the house of John Thomas, of Winthill. In Bristol the meetings, though not held in private houses, became very exclusive in their character. A Friend is still living amongst us, Arnee Frank, now in his ninety-second year, who remembers the operation of this exclusive system. He has told me that when he returned to Bristol in 1792, from his apprenticeship to Thomas Young, of Milverton, he believes the late Joseph Storrs Fry and himself were the only young men in Bristol who ventured to intrude themselves into the meetings for discipline.* It was natural that, under such circumstances, a struggle for pre-eminence should have led, as of old, to dissension and party spirit. The manner in which the Bristol Yearly Meeting exercised its disciplinary powers, became a matter of great dissatisfaction to the meetings composing it; and the opinion was repeatedly expressed that it should be held as a meeting for worship only. A minute of the Somersetshire Quarterly Meeting,† on this subject, says—"We find Friends very desirous that fellowship may be maintained in charity, which is our best fortress. We don't approve that Friends be obliged to answer any stated questions, but may be left at liberty to ask or answer, as in the wisdom of God may appear to edification."‡

(To be continued.)

SUMMER FLOWERS.

Bounteously the God of nature
Strews the face of earth with flowers,
Breathing incense all around them,
Fragrant homage to their Maker;
Whispering to human bosoms
Holy thoughts of love and kindness,
Steadfast hopes about the future,
Forming thus an earthly rainbow
Full of promise to the weary,
To the meek and to the lowly,
To the poor and broken-hearted,
To the sinner heavy-laden,
Giving each a firm assurance
Of a God who governs all things
Tending them with care parental.
For the great Redeemer tells us,
Solomon in all his glory
Was less glorious than the lily,
And thence inculcates the lesson,
That if God so clothe the lily

* I have heard an anecdote of an American Friend, who being present at a meeting for discipline, held about that period, and hearing a young man complained of for taking too active a part, remarked—"if it was not for the old men, the young men would set the house on fire; and if it was not for the young men, the fire would go out."

† 1722.

‡ The Bristol Yearly Meeting ceased to act as a meeting for discipline in 1772, but was continued some time longer as a meeting for worship.

In a panoply of beauty,
For its very brief existence,
He will much more clothe the creatures,
Formed exactly in his image,
And the heirs of a hereafter
Weak and faithless though he knows them.

Flowers, more than merely flowers,*
Are with sanctities invested,
Sanctities that form a girdle
Round about their simple beauty,
Tinting it with all their magic,
Pouring into it their spirit;
Such are all the gems poetic
That adorn the favorite flowers,
Gems the wealth of many ages,
Legacied to man forever,
Gems that always glint and glisten
On the faces of some flowers,
Making them with this adornment,
Bright Forget-me-nots that Flora
Grants to her devoted poets:
These the true rewards of merit;
She bestowed the floral rainbow
On the Bard of Hiawatha;
Burns received the thorn white-blossomed;
Cowper the white water-lily;
Walter Scott the slender hare-bell;
Wordsworth had the yellow primrose;
Burns and Wordsworth share the daisy;
And so with a thousand others;
When we gaze upon the flower,
Then we think upon the poet,
And with recompense poetic,
Worthy names are thus remembered.

See the tottering infant pulling
Drooping blue-bells in the meadow,
Or the sweetly-scented cowslips,
Or the gay and glowing king-cup,†
Plucking in mere admiration,
Haply the mere love of having,
Irresistibly attracted
By their lavish wealth of beauty,
Thus unwittingly evincing,
In first infancy evincing,
Love of beautiful creations,
And thus simple homage paying,
Truthful infant homage paying,
To the Maker of the flowers;
Purest sentiment, God-given.

But not thus alone in childhood;
For the simple-hearted maiden
Doats upon the various flowers,
Brought to blossom by her training,
Doats upon the opening rose-bud,
Type of her maturing beauty,
And its day of beauty passing,
When its scented leaves are falling,
Treasures up the scattered fragments,
With a sympathetic fondness,
To yield perfume sweet hereafter,
Haply feeling them inwoven
With some thoughts she fain would cherish.

And in later life how often,
Man oppressed and man oppressing,
Striving onward for some blessing,
Some imaginary blessing,
Haply of his own creating,
Often beaten in the struggle,
Even when he seems succeeding,
Wounded will he leave his fellows,
And apart from all that's worldly,

Seek the sympathy of flowers.

* * * * *

Long as nature reigns within us,
There exists in human bosoms
This sweet sympathy with flowers,
Quench it not, the gentle feeling
Guides the trusting spirit upwards.

EDWARD NEWMAN.

LETTER FROM A YOUNG PENNSYLVANIAN, NOW
PRACTISING DENTISTRY IN GERMANY.

Dear S.—I look forward with anticipations of unbounded pleasure to the time that I may be permitted to meet you. Whether that time will be long, or short, or ever, of course I am unable to know; but I trust, however, that it may be before age or the cares of the world shall damp the ardor of youthful enjoyments. I want to see you young and happy with your gay young friends around you.

Shall I tell you how I live now? First I must tell you some of the German customs of living. Instead of a family occupying a whole house, as with us, it is here, almost universally, that they only use one floor of the house; so that if the house is four stories high, there will be four families living in it. The houses are built so large, however, that we frequently find as many rooms upon one floor as there are in some of the large houses in Philadelphia. The second story of the house is always considered the most desirable, and rents for at least twenty per cent more than any of the other floors. Now, I have four rooms in the second story of a house which are apportioned as follows: Parlor, office, bed-room, and laboratory. You will ask, where is my dining-room and kitchen? but I will reply, that such things are too superfluous for a bachelor life in Germany, and are very easily dispensed with, as you will see in the end.

Generally, before 7 o'clock I am up, and after spending about an hour in reading, or studying, I ring the bell, and my coffee and a couple of rolls and butter are sent me, which constitute my repast; (one roll without butter is the German allowance.) I have fallen into the custom of taking only coffee and bread and butter in the mornings, but frequently, while sipping the beverage, I have gay visions of American beefsteak, fried ham and eggs, or a smoking veal cutlette; but all those dreams vanish as the steam of the coffee subsides.

At nine o'clock I am at my business, which occupies me, mostly without intermission, until 5 o'clock in the afternoon. Occasionally I take a lunch at 12 o'clock, but very rarely do I eat anything between my coffee in the morning and dinner at 5 o'clock. Now you will scold when I talk to you about dining at 5, notwithstanding I must persist in my course, for I not only find it more convenient but very agreeable. You are aware that my operations require good light, therefore I must make use of the part of the day

* Wordsworth.

† Caltha palustris.

that furnishes the most light. It is also exceedingly disagreeable to operate after having eaten a hearty meal, therefore I put off dining until I am through with my business, when I go at it at my leisure, and enjoy the matter equally as well as if I were to progress with it at 12 or 1 o'clock. After dinner I go to a club room, and read the newspapers, and drink my cup of coffee. I spend a part of most of my evenings with the Consul, and I have a few scientific friends here, in whose company I manage to spend many of my leisure hours. Social home gatherings are things that are very little known or practised among the Germans; in fact they have few domestic pleasures; everything is outward. The club room, the theatre, the ball room, concerts and the public gardens, constitute the sum of their happiness, always allowing them to have plenty to eat and drink. They cannot appreciate a social collection of friends and acquaintances gathered together to spend an afternoon or an evening. All society is exceedingly ceremonious and with us would be exceedingly borous. I have no society except Consul Ricker, and he is an old Louisianian, a widower, and very clever, notwithstanding we quarrel very often on the slavery question.

But I have not told you how I dine. It is so customary here for persons to dine alone, that every provision is made for having that part of the operation of life attended to in the most convenient manner, and there are large establishments which furnish dinners in that manner. Each portion is placed in a pile of jars fitting one in the other, so that each jar forms a lid for the one below it, and each dish is placed in a separate jar. When the complement of dishes is made up, the whole pile of jars is strapped together by passing a leather band around them and through ears that are provided upon their sides for that purpose; the whole making a pile from eighteen inches to two feet in height. In such an establishment as described is my dinner brought to me at 5 o'clock, when it is served up to me by some member of the family, in the house I am living. At this time I am honored by the services of the daughter, a little blue-eyed, red faced, yellow haired, Dutch girl of about twelve summers.

Now, just imagine me seated at a table by myself, more lonely even than Selkirk, (for he had his cats and goats to feast with him) with a newspaper by my side, peeping into each jar as it is opened, and my eyes darkening or brightening, according as the prospect is agreeable or disagreeable; my little Dutch waiter moving about as mute as a sphynx, mechanically placing the dishes as they are required, then you will have an idea of the pleasures that I enjoy about 5 o'clock each day.

At 9 o'clock in the evening I take my cup of tea, and then I am ready for two or three hours' study. Such is the routine of my life in Frank-

fort; the sum total of it being a kind of social banishment. Were it not for the opportunity of study, I should in no wise tolerate the exile that I am now subjected to.

Although I have dated my letter Frankfort, still I am not living in that city, but have ensconced myself in the first house over the line in Hesse Cassel. Possibly a little explanation may be satisfactory to you. You must consider, the whole territory of the free state of Frankfort is not much larger than a good sized Virginia plantation. It is on both sides of the river Maine, the town being on the east side and extending to the limits of the territory on that side where a part of the electorate of Hesse joins the town. In this territory of Hesse is also a town called Rockenheim, so that the two towns are united, but under different governments. Now the laws of Frankfort are such as prevents any foreigner from engaging in business there, therefore it was impossible for me to live there and follow my profession. But as the good old Elector of Hesse, whose grandfather sold the Hessians to the English to fight against the Americans, had formed a favorable opinion of my operations, he gave me a special permission to live in this town of Rockenheim, and so here I am, not in Frankfort, still as good as there.

March 20th. I was obliged by absence to lay by your letter for some days. I have just returned from Wiesbaden, the principality of the Duchy of Nassau, and one of the most celebrated watering places in Germany. It is at this place where the springs produce the celebrated seldern water that is known the world over.

Yesterday I received a letter from your mother, full of practical information, tender feeling and wise counsel. It speaks of E.'s great inclination for mechanics. It is a laudable ambition. There is no profession or calling that is more calculated to expand and develop an ingenious mind than that which he is desirous of choosing, and none are more highly recommended than those that excel in this department. Think of Hart, Fulton and Morse, names that are imperishably written upon the world's history—and who can decry the calling that produced such names? I would say to him, aspire to an eminence in that profession that is so broad, so free, and so honorable. My love to our family and all my friends,

Truly, your brother, F. C.

OUTSIDE AND INSIDE.

"Two things a master commits to his servant's care," saith one,—“the child and the child's clothes.” It will be a poor excuse for the servant to say at the master's return:

“Sir, here are all the child's clothes, neat and clean, but the child is lost!”

Much so with the account that many will give to God of their souls and bodies at the great day.

Lord, here is my body; I was very grateful for it; I neglected nothing that belonged to its comfort and welfare; but for my soul, that is lost and cast away forever, I took little care and thought about it.—*Flavel*.

ITEMS OF NEWS.

TEA PLANT.—The government is seriously prosecuting the enterprise of introducing into the United States the culture of the tea plant. A ship is now on her voyage from Canton to New York with 60,000 plants, selected with great care by a special agent of the Patent Office.

GUANO.—The news from California contains accounts of the discovery of not less than five guano islands, by a San Francisco vessel. It is stated that altogether there have been as many as seventy islands of this useful fertilizer discovered, and claimed by Americans.

EXPLORING EXPEDITION.—There are now two surveying or exploring parties employed by the Federal Government, and about taking the field under the direction of the Topographical Bureau. The first is despatched to explore the San Juan river, in New Mexico, a tributary of the Colorado of the West, and to discover, if possible, a route between Santa Fe and Utah, in the vicinity of the San Juan. The other party is charged with an exploration of the Yellow Stone and Missouri rivers, a service of magnitude and importance, which will keep the expedition in the field for at least eighteen months.

The Canada brings intelligence of the death of Baron Frederick Henry Alexander Humboldt, author of "Cosmos," in the 90th year of his age. He was born in the year 1790. As a practical man of science, a traveller, an observer and elucidator of the phenomena of nature, a diplomatist, a practical philosopher, and a great writer, Humboldt has made a reputation which will outlive the ephemeral celebrities of the day. But what will ever distinguish him from the mass of physical inquirers who had preceded him, is the study of the universe as a harmonious whole, and his search for the laws of order, beauty, and majesty, beneath the apparent confusion and contradictions of isolated appearances. He retained his intellectual faculties to the last.

The death of Dr. Dionysius Lardner is announced. Dr. Lardner visited this country several years ago, and did much to popularize science, by his lectures on astronomy, and other subjects.

CAMELS.—The *Mobile Tribune* notices the arrival at that city of twenty-one camels from Texas. Eight of them have been engaged, and the balance are for sale for plantation use. It is said one of them can easily carry two bales of cotton on its back, at the rate of twenty-five miles a day, over a road which would be impassable to an empty wagon drawn by a pair of mules. The cost of keeping them is very little, and in endurance under labor and privation, no animal can excel them. They are also gentle in disposition.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is more inquiry for Flour, but at figures below the views of holders, who are firm at \$7 25 per bbl. for standard brands. The sales to the trade range from this figure up to \$8 75 for fancy lots; condemned sold at \$5 25. We quote Rye Flour at \$4 75, and Corn Meal at \$4 per bbl.

GRAIN.—There is a better feeling in Wheat. Sales of 3000 bushels at \$1 79 a 1 90 per bushel for Pennsylvania and prime Western Red, and \$1 85 a 1 95 for White. Rye is steady at 95 cents. Corn is held

at figures generally below the views of holders. Sales of yellow at 92 a 96 cents in store. Oats are dull at 54 and 55 cents.

CLOVERSEED is scarce at \$5 a 5 25 per 64 lbs. No change in Timothy or Flaxseed.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Penciling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Atleboro', Bucks Co., 5th mo., 28, 1859. 6m.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address
WM. HICKLEN,
Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,

Cheap School Book Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON,

MAGGIE B. JACKSON,

Assistants.

Address Kennel Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER,

SUSANNA G. CHANDLER,

Proprietors.

3d mo. 19, 1859.—10 t.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SIXTH MONTH 4, 1859.

No. 12.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

(Continued from page 163.)

On the Original and Present State of Man.

James. Brother John and I have lately been conversing about the original and present state of man, but we cannot agree in opinion, and have concluded to ask thy views upon the subject. He contends, that the transgression of Adam, in eating the forbidden fruit, produced an entire change in the nature of man, so that we are all born in a corrupt and sinful state; and that we are liable to punishment, not only for our own transgressions, but likewise on account of the guilt of our first parents, which he says is imputed to all their offspring. This doctrine I cannot believe; for it appears to me to be entirely inconsistent with the justice and mercy of the Divine Being, to impute to me a sin which I never committed; nor can I understand how the nature of man could be so completely changed by that one transgression of Adam; for we do not find any inherent difference now between the children of the righteous and the children of the wicked; they appear to be all born in the same state, though it is acknowledged that the example and teaching of their parents have a great influence upon their characters.

John. I do not reason in this way upon subjects of so momentous a character, but am content to refer to the Scriptures of truth, which, being written by inspired men, are a much safer dependence than the fallible reason of man.

Father. I believe that all Scripture, "given by inspiration of God, is profitable for doctrine, for reproof, for correction, for instruction in righteousness; that the man of God may be per-

fect, thoroughly furnished unto all good works." The truths contained in the Scriptures, if properly understood and made the rule of our actions, are of inestimable value to man; but it is very evident that they cannot be understood without the exercise of reason; for a man deprived of reason could not derive the least benefit from them. They are addressed to the understandings of men; but owing to the imperfection of human language, they are liable to be misunderstood, especially by those who have no experimental knowledge of the things to which they relate. The most valuable parts of Scripture are those which relate to spiritual things; but in order to understand them clearly, we must come to the knowledge of the things themselves. When we undertake to study any natural science, we are not satisfied with merely reading descriptions of natural objects, but we examine the objects for ourselves. For instance, the science of botany describes the various plants and flowers which the great Creator has so profusely scattered over the face of the earth; but we cannot obtain an accurate knowledge of them, merely by reading descriptions; we must ourselves examine the things described; and in order to do this, we must have *light to assist us*. Now this is the course we ought to pursue in the examination of spiritual things. The Scriptures inform us, that "the kingdom of God is within us," and that it consists of "righteousness, peace, and joy in the Holy Spirit." But what will this description avail us, unless we look within us to find these things, and become obedient to the teachings of the Holy Spirit, whose light will make them manifest? There is much useful information in the Scriptures, about the state of original purity in which man was created: the state of sin and corruption into which he has fallen by disobedience; and the state of restoration and salvation which is obtained by the faithful servants of Christ. This information is sometimes conveyed in plain and simple precepts, which may be understood literally; but it is often adorned with metaphors, and not unfrequently it is clothed in parables or allegories, according to the genius of the oriental languages. It is well known that Jesus frequently spake in parables, which were not generally understood by the multitude, and that he explained their meaning to his disciples. But even to his disciples he did not open everything at once, for he said, "I have many things to say

unto you, but ye cannot bear them now." There are many pious men, who do not doubt that the account given by Moses of the garden of Eden and the fall of our first parents, is literally true, yet they believe it has in it a spiritual signification of far more importance to us.

John. I am afraid to depend upon these spiritual significations, lest I should overlook the literal meaning of the text, and thus convert the whole Bible into an allegory. When anything is stated as a parable, I am then willing to look for a spiritual meaning, but not otherwise.

Father. It appears that the apostle Paul was of a different opinion; for he says, when speaking of the two sons which were born unto Abraham, that they were "an allegory" of "the two covenants." Gal. iv. 24. Yet Moses does not say it is an allegory, but relates it as a matter of history; and I have no doubt the facts did occur just as Moses has stated them, and that the spiritual meaning revealed to the apostle is equally true. It will be acknowledged by almost every experienced mind, that the account given by Moses of the journeying of the Israelites from Egypt through the wilderness to the promised land, contains a faithful and beautiful allegory of the Christian's progress from a state of darkness and sin, to a state of gospel light and salvation; yet who can suppose that this view of the subject impairs our belief of the facts related by Moses? With respect to the garden of Eden, in which man was originally placed when he was created, there can be no doubt that the account given by the inspired penman is beautifully descriptive of that state of spiritual enjoyment which resulted to Adam from his dressing and keeping the trees of the garden; or, in other words, from his keeping in their proper order all the desires and affections of his animal and spiritual nature, which were given for the promotion of his happiness, and pronounced to be good. That the garden of Eden was considered among the holy men of old as a state of spiritual enjoyment, we have an evidence in the writings of the prophet Ezekiel; for he says, in addressing the king of Tyrus, "Thus saith the Lord God, Thou sealest up the sum, full of wisdom and perfect in beauty. Thou hast been in Eden, the garden of the Lord; every precious stone was thy covering, the sardius, the topas, and the diamond, the beryl, the onyx, the jasper, the sapphire, the emerald, the carbuncle, and gold; the workmanship of thy tabrets and thy pipes was prepared in thee in the day that thou wast created. Thou art the anointed cherub that covereth, and I have set thee so: thou wast upon the holy mountain of God; thou hast walked up and down in the midst of the stones of fire. Thou wast perfect in thy ways from the day thou wast created, till iniquity was found in thee." Ezek. xxviii. 12 to 16. Behold, what a state of purity and wisdom was here, and that

too "from the day he was created!" But he fell from this state of righteousness; for the prophet goes on to say, "By the multitude of thy merchandize they have filled the midst of thee with violence, and thou hast sinned. Therefore I will cast thee as profane out of the mountain of God; and I will destroy thee, O covering cherub, from the midst of the stones of fire!"

James. There is a very striking resemblance between the state here described, and that of our first parents as represented by Moses: for it appears that this king of Tyrus had "been in Eden, the garden of God;" that he was "full of wisdom and perfect in beauty;" and that he was "perfect in his ways from the day he was created, till iniquity was found in him." And it appears, too, that his punishment was similar to that of Adam; for he was "cast as profane out of the mountain of God." Now it becomes an interesting inquiry with me, whether the cause of his fall was not similar to that of Adam, and whether all men are not, like him, created pure and innocent, by the great Author of our being: for "have we not all one Father?" and "hath not one God created us?" Mal. ii. 10. And if God is "the Father of spirits," as the apostle testifies, Heb. xii. 9, must not our souls come pure out of his hands?

Father. The first of these inquiries, in relation to the manner in which the king of Tyrus fell from his state of purity, is answered by the prophet Ezekiel. "Thus saith the Lord God, Because thy heart is lifted up, and thou hast said, I am a God; I sit in the seat of God, in the midst of the seas; yet thou art a man, and not God, though thou hast set thy heart as the heart of God." Now it appears that the sin of our first parents was somewhat analogous to this; for they were induced to believe that they "should be as Gods, knowing good and evil," and after they had yielded to the temptation, "the Lord God said, Behold, the man is become as one of us, to know good and evil." Gen. iii. 5, 23.

James. There is a difficulty with me in understanding what Moses has said about the tree of the knowledge of good and evil, which was placed in the midst of the garden, and of which our first parents were forbidden to eat: for this appears to me like placing a temptation before them; and yet the apostle James has said, "God cannot be tempted with evil, neither tempteth he any man."

John. I cannot see that the difficulty would be removed, by saying that the tree here spoken of was some evil principle in the mind of Adam: for all his principles before the fall were derived from above. It appears to me that the temptation was suggested by the serpent, who was only an instrument of satan and endowed by him with a miraculous power of speech and reason. We are told that the evil one has the power of "transforming himself into an angel of light;"

and therefore it was in his power to assume the form of a serpent, in order to effect his malicious designs.

James. As far as my own experience is concerned, I have no evidence of an evil spirit as existing separately from man; all my temptations have arisen from the perverted appetites and desires of my own nature, which are sometimes so disguised by self-love as to appear like ministers of happiness, or angels of light.

Father. I do not think we shall gain anything by discussing the much debated question about the existence of a devil; for, whether there be an evil spirit separate from man or not, I think it is very clear that unless our first parents had possessed in themselves a desire for the forbidden fruit, no persuasions of a disguised enemy could have induced them to eat it, contrary to the divine prohibition. A person with no appetite for food, would never fall into the vice of gluttony, especially if he knew that it would destroy his life. It is said, "The woman saw that the tree was good for food, and that it was pleasant to the eyes, and a tree to be desired to make one wise." Consequently she has an appetite or desire to partake of its fruit. This tree must have been created good, and intended for some good purpose; for when the work of creation was finished, "God saw everything he had made, and behold it was very good." Now let us recur to our own experience, and we shall find that all our animal appetites, and all our mental desires and affections, are not only necessary to our existence, but conducive to our happiness, when kept under the government of the Divine Spirit, which gives life to the soul. It is only when they are perverted from their original purpose that they become instruments of evil. Adam was created in the image of God; that is to say, his mind was like the Divine mind, full of purity, benevolence and joy; and he enjoyed the privilege of spiritual communion with God; which is to partake of "the tree of life, which is in the midst of the paradise of God." Rev. ii. 7. But, although he was made a free agent, he was not intended to be so independent of God as to know of himself what was good and what was evil, without waiting for Divine direction. And when he presumed to set up his own will, and to be governed by it in opposition to the Divine will, he assumed the place of God; and having thus turned away from the Holy Spirit, he ceased to partake of "the tree of life;" and, consequently, he died a spiritual death. It was thus that he experienced the fulfilment of the Divine prediction, "In the day that thou eatest thereof, thou shalt surely die;" for, "to be carnally minded is death; but to be spiritually minded is life and peace." But in this state of alienation from God, Adam was not deserted by the mercy of his heavenly Parent; for he felt "the reproofs of instruction, which are the way of

life." That same Divine Word which had been his joy and his consolation while in a state of innocence, now became his reprover and his chastener. It was to him as "a flaming sword, turning every way to keep the way of the tree of life," and to exclude him from the garden of Eden, which he was no longer worthy to enjoy. Every one who has attended to his own experience, knows what it is to be condemned for deviating from a known duty; how completely it shuts him out from a state of enjoyment, and prevents him from partaking of that peace of mind which is the reward of obedience. "For the word of God is quick and powerful, and sharper than any two-edged sword, piercing even to the dividing asunder of soul and spirit, and of the joints and marrow, and is a discernor of the thoughts and intents of the heart. Neither is there any creature that is not manifest in his sight; but all things are naked and open unto the eyes of him with whom we have to do." Heb. iv. 12. How merciful, how beneficent, is the Divine Author of our being, that he will not suffer us to rest in peace, while in a state of disobedience to his holy law! For in this state of alienation from him we never could be happy.

The happiness of man, both here and hereafter, is not made to depend upon any extraneous circumstances, such as the possession of an outward garden; but it depends upon the state of his mind, and the government of his affections. God is perfectly happy and beneficent himself, and he wills that all his creatures should be happy; but it is impossible for any to participate in his happiness, without becoming in some degree "partakers of his nature," and by the operations of the Holy Spirit, being renewed in the image of God, in which we are created.

(To be continued.)

When God has fully prepared the heart for religious action, we need not fear that he will fail to find for us our appropriate work. He knows the work which is to be done, and the time of its being done, as well as the dispositions which are fitted for doing it. Be watchful, therefore, but wait, also. A good soldier, in the spirit of watchfulness, is always ready for action; but he never anticipates, by a restless and unwise hurry of spirits, the orders of his commander. — *Upham.*

A Memorial of Horsham Monthly Meeting concerning our friend Isaac Parry, deceased

We have felt a concern to give forth a brief memorial respecting this our beloved friend, from a conviction that some account of his exemplary life and labors will be encouraging and useful to survivors, and may be as bread cast upon the water for generations yet unborn. We

desire not to exalt or honor any attainments of the natural man, but to hold up as an example one who gave heed to the teachings of the spirit of truth in his mind, and thus became a willing and obedient scholar in the school of Christ, and so subjected to his cross, that he could adopt the language of the Apostle, and say, "by the grace of God I am what I am," thus promoting the honor of truth, and encouraging those who are following after, to place their whole reliance on that Power which does protect and bear along in safety all those who place their dependence thereon.

He was the son of Jacob and Sarah Parry, and was born in Bucks County, Pa., on the 7th day of the 5th month, 1774, in the same habitation in which he died, and was a member of Horsham meeting all his life. When a young man, he felt a lively interest in the political concerns of the country, and mingled considerably with the politicians of the day, but becoming convinced that it had a scattering effect, and that its tendency was to divert his mind from the main object of life, he withdrew from a participation in all concerns of the kind, not even exercising the right of suffrage for many years of the latter part of his life.

He was early brought under exercise and travail for the promotion of truth, and was much engaged in the service of Society in the various duties that generally devolve upon well qualified members; he was appointed to the station of an elder by the monthly meeting about the 40th year of his age, and about the same time he was chosen a member of the meeting for sufferings. In the former service he continued until death; the latter he was released from, at his own request, about eighteen months previous to that event.

He was enabled, by keeping his eye single to the light of Christ, to discharge the various duties with which he was entrusted, to the satisfaction of his friends, and was much looked to for counsel and advice in matters of importance in the church and in the community at large, and could have exercised much influence amongst his brethren; but he has been heard frequently to say, that no friend ought to have an influence of himself, but that all ought to endeavor to weigh what was under consideration, and thus obtain the mind of truth, letting the man be of no reputation.

He was among the first in the meeting of which he was a member to bear a testimony against the use of ardent spirits as a drink. We believe that when he first felt the weight of the subject, spirituous liquors were usually used in the harvest field, and very generally as a common drink. It was then believed that the harvest could not be collected without it, but he with a few others believed it to be their duty to take up the cross without regard to consequences, and by patient perseverance the concern advanced in Society

and the neighborhood at large, and they never suffered loss by their faithfulness to convictions of duty in this important concern. Thus originated in the monthly meeting of Horsham the testimony against the use of ardent spirits as a drink.

As an elder he was eminently gifted to administer counsel or reproof to ministers without giving offence, and by his kind and affectionate manner encourage them in the faithful discharge of their duty. To the widow and the fatherless he was ever ready to lend a helping hand; his advice was much sought in cases of difference, where the enemy had found place in setting brother at variance with brother; in some cases he would be consulted by both parties without each other's knowledge of such being the case: and under that gathering feeling that clothes the messengers of peace, his labors in this very important service were eminently blessed. In many instances, peace would be restored, and law suits probably prevented, that might have been disastrous in their consequences.

From early life, he bore a faithful testimony, by example as well as precept, to the great advantage of closely adhering to our ancient testimony in regard to plainness in dress and address, and also of diligently attending all our meetings, in which duty he continued to the close of his life, thus showing his faithfulness in what some may consider small things; and we have no doubt but it was through faithfulness in the little that he was made ruler over more,—thus becoming established in the truth, and a pillar in the Lord's house that went no more out, which was eminently depicted in his solid countenance and dignified deportment when assembled, which will long be remembered with tender emotions by those who met with him.

The last years of his life were marked by a quiet and serene spirit, being redeemed from the strife and confusion that is in the world, thus experiencing that peace the world cannot give, neither can it take away. He appeared to be waiting for the last solemn change, and when it came it was in the way often expressed by him as a great favor, to be removed out of time suddenly without a lingering illness.

The pale messenger came, and at a moment's warning summoned him to leave all things terrestrial, and appear before the judgment seat of Christ,—to render an account of the talents committed to his charge; and we trust that he was found watching and prepared to receive that crown that has been promised to all those that love the appearing of our Lord and Saviour Jesus Christ.

Thus ended the long and useful life of this our beloved friend on the evening of 21st of 10th month, 1857, in the 84th year of his age.

Surely to him death had no sting, and over him the grave no victory.

Read and approved in the monthly meeting

aforesaid, held the 29th of the 12th month, 1858, and signed by direction thereof.

“LET BROTHERLY LOVE CONTINUE.”

This world is a state of probation. Seeing, then, that this is the case, we may safely conclude that the cup designed for us by a beneficent Father to partake of, in this life, is wisely mixed, in order that we may not set our affections on things below, but on things above; and be prepared when done with the conflicts of time, for the fruition of joy in the endless ages of eternity.

Are we not constrained to believe that if we lived near the Divine Master and minded his instructions, that our lives would be fraught with greater peace and enjoyment? Man's stubborn, unregenerate will, often makes trouble; sometimes in the family circle, as well as in neighborhoods and nations; and these trials and dispensations permitted by an overruling Providence, may, if properly received, tend to our refinement and purification.

The prophet, in view of the display of Divine power and goodness as left upon record, gives the following touching and sublime description: “When I consider thy heavens, the work of thy fingers, the moon and the stars which thou hast ordained; what is man that thou art mindful of him, and the son of man that thou visitest him? For thou hast made him a little lower than the angels, and hast crowned him with glory and honor. Thou makest him to have dominion over the works of thy hands, thou hast put all things under his feet. All sheep and oxen, yea, and the beasts of the field, the fowls of the air and the fish of the sea, and whatsoever passeth through the paths of the seas.”

But when man rebels against the light which shines in the heart, and the voice of wisdom speaking there, not having the animal propensities and dispositions of his nature kept under the control and government of the Divine law, he falls below the dignified station intended for him by an all-wise Creator.

Hence angry passions rise, venting themselves in reproaches, shyness, fault-finding, tale-bearing and detraction, and all other evils which follow in their train. The sword is not beaten into the ploughshare, nor the spear into the pruning hook. Thus, “man's inhumanity to man makes countless thousands mourn,” instead of being cheered by the sunlight of kindness,

and the exercise of those heaven-born virtues—meekness, patience, and forbearance—which shine conspicuously and adorn the Christian character. May we rally to the standard of eternal truth and excellency, and witness the subjugation of our will to the Divine will, that we may prove what is the perfect and acceptable will of our Heavenly Father concerning us; and as we are obedient and faithful to that light which never deceives, we shall realize the truth of the Scripture testimony, “That one shall chase a thousand and two put ten thousand to flight.” It is only as we dwell under the influence or operation of the spirit of truth within our own breasts, that we are redeemed from all that hurts or destroys; when the love of God fills our hearts, we feel a righteous care, to live as much as in us lies, peaceably with all, letting our light so shine before men, that they, seeing our good works, may glorify our Father which is in heaven. R. P.

5th month, 1859.

BERNARD BARTON.

The name of Bernard Barton has been sufficiently well known in English literature for the last twenty years. Its bearer primarily attracted public attention, partly by his real and intrinsic merits as a poet, and partly as being a member of a sect supposed to be somewhat averse to poetical pursuits. Bernard Barton was a Quaker, and the son of a Quaker. The Society of Friends had indeed produced poets before his day, the best known being Scott of Amwell, Lloyd, and Amelia Opie; and many even of the earlier and primitive Quakers wrote verses, usually very bad ones, but still sufficing to show that the “profane art” of rhyming was not originally discountenanced altogether by the body. However, poesy in drab attire formed a rare enough spectacle in the young days of Bernard Barton, to give a strong zest of novelty to his first literary appearances, and to win for him the name *par excellence* of the Quaker Bard. Nor did the later entrance into the same field of the Howitts, and other able writers of his own persuasion, deprive him while he lived of that honorable distinction.

Bernard Barton, as we learn from an interesting memoir of him, issued under his daughter's eye, was born in London, January 31, 1784. His more remote progenitors had been yeomen of Cumberland, where the name is yet well known; but the poet's father, who first left the Church of England and joined the Society of Friends, moved southwards with his family, and entered, in and near the metropolis, into various pursuits in life. Finally, he was cut off prematurely, and left Bernard, with other children, to the care of a second wife, who behaved so well to the offspring of her predecessor, that they had actually advanced in years before they knew her to be only their

step-mother. This amiable woman, who was of the Quaker persuasion, carried all the children of her deceased spouse to the home of her own father at Tottenham, and there they were brought up in childhood. Bernard received the stamina of his education at an Ipswich school; and, at the age of fourteen, he was apprenticed to Samuel Jesup, a shopkeeper at Halstead, in Essex. "There I stood," he writes, "for eight years behind the counter of the corner shop at the top of Halstead Hill, kept to this day (in 1828) by my old master, and still worthy uncle, S. Jesup." Jesup became the "uncle" of Barton through the marriage of the latter with Lucy Jesup, niece of the shopkeeper, in 1807. With one of her brothers, the subject of our memoir entered at the same time into partnership, as coal and corn merchant, at Woodbridge; but the death of his consort, in giving birth to an only child (the well beloved daughter, who long tended and and finally survived her sire), threw the still youthful Bernard again loose upon the world, and he engaged himself as private tutor in the family of Mr. Waterhouse of Liverpool. In doing so, he indulged so far his already strong preference for the pursuits of literature; but he was destined, after all, to win his staple living chiefly by the ledger, and not by books of another sort. After a residence of one year at Liverpool, he returned to Woodbridge, and there entered on a clerkship in Messrs. Alexanders' bank—an office held by him for forty years, or, in other words, up to the period of his decease (February 19, 1849).

Brief as this account is it comprises all that is interesting in the non-literary career of Bernard Barton. He derived from his post in the bank a sufficiency of income to maintain himself and his daughter comfortably; and he turned to letters mainly as a relaxation; prompted thereto by the stirrings of his natural genius and acquired tastes. True it is (as will be noticed afterwards) that he did yearn at one time to devote himself wholly to literature, but he was diverted from the attempt by the counsels of Friends. It was in 1812 that Bernard Barton published his first volume of poems, entitled "Metrical Effusions." The transmission of a copy to Keswick led to a correspondence with Southey, which was continued at intervals for a number of years. Notwithstanding his apparently sincere enthusiasm in favor of the Church of England, Southey evinced ever though life a warm sympathy with renowned sectarians, such as Wesley and Fox (not to include Bunyan), whose several histories he personally wrote in a spirit of earnest admiration; and Barton stood therefore in a favorable position to attract his kindly regards.

The late Francis (Lord) Jeffrey behaved very kindly to Bernard Barton, on the whole. It is a singular fact, indeed, that, after being somewhat overvalued by many for a time, and as much

undervalued by many in the next generation, people have now begun generally to admit that Jeffrey was far more often in the right than the wrong, and that all his critical decisions bore the stamp of strong discernment, if not of positive genius. We cannot allow the case even of Wordsworth to be an exception. The early lyrics of that poet, such as the "Idiot Boy," "Goody Blake," and the like, which the Edinburgh critic chiefly contemned, are to this hour prized highly by nobody; and had not the bard of Rydal utterly cast aside his own starting canon, which prescribed the use, in verse, of the plainest language of common life, he certainly would not have left behind him the name of the first poet of his age. No poetry in our language equals that of the "Sonnets," and other great pieces of Wordsworth, in stateliness and elaborate dignity; and it may well be asked, if the criticisms of Jeffrey had no share in leading the poet of the lakes into the wiser track which he irradiated with such a flood of splendor. The remarks of the Edinburgh critic, respecting Barton, give a very clear view of his real merits: "The staple of the whole poems is description and meditation—description of quiet home scenery, sweetly and feelingly wrought out—and meditation, overshadowed with tenderness and exalted by devotion—but all terminating in soothing, and even cheerful views of the condition and prospects of society." It was in the same place observed that the poet had "a fine and cultivated, rather than a bold and original mind." This remark may be applied not only to the pieces which lay before the reviewer at the time, but to all that followed from the same pen. Besides a poem on the subject of "Napoleon," published in 1822, not less than five small additional volumes of verse by Barton appeared betwixt that year and 1828. He continued to compose occasionally after that period, for annuals and other periodicals, but no new volume was issued until 1845, when he obtained leave to dedicate his final collection of verses to Queen Victoria. Old age had now advanced upon him, and brought with it ailments of some severity. It is not unworthy of note, by the way, that Bernard Barton, while most temperate in his living, neglected or violated one grand sanitary rule, always held as scarcely of inferior importance. As he himself humorously said, he had for forty years taken "as little exercise as a milestone, and far less fresh air." Possibly, however, the symptoms of heart disease, which attacked him latterly, may have arisen from this very neglect of free and regular exercise. Be this as it may, in the beginning of 1849, Bernard showed marks of a failing system, though never forsaken for a moment by the cheerfulness habitual to him through life. The "last scene of all" is thus noticed in the "Memoir." "On Monday, February 19, he was unable to get to the bank, having passed a very unquiet night—the first

night of distress, he thankfully said, that his illness had caused him. He suffered during the day, but welcomed as usual the friends who came to see him as he lay on his sofa; and wrote a few notes—for his correspondence must now, as he had humorously lamented, become as short-breathed as himself. In the evening at half-past eight, as he was yet conversing cheerfully with a friend, he rose up, went to his bedroom, and suddenly rang the bell. He was found by his daughter—dying. Assistance was sent for; but all assistance was vain. 'In a few minutes more,' says the note dispatched from the house of death that night, 'all distress was over on his part—and that warm, kind heart is still forever.'"

Bernard Barton was sincerely and habitually religious, and many of his pieces bearing on serious and Scriptural subjects, breathe the very spirit of bland and hopeful Christianity. Of such a cast is "In Coelo Quies."

"Not in this weary world of ours
Can perfect rest be found;
Thorns mingle with its fairest flowers,
Even on cultured ground;
A brook—to drink of by the way,
A rock—its shade to cast,
May cheer our path from day to day,
But such not long can last;
Earth's pilgrim, still, his loins must gird
To seek a lot more blest;
And this must be his onward word—
'In heaven alone is rest.'

"This cannot be our resting-place!
Though now and then a gleam
Of lovely nature, heavenly grace,
May on it briefly beam;
Grief's pelting shower, Care's dark'ning cloud,
Still falls, or hovers near:
And sin's pollutions often shroud
The light of life, while here.
Not till it 'shuffle off the coil'
In which it lies deprest,
Can the pure spirit cease from toil;
'In heaven alone is rest!'

"Rest to the weary, anxious soul,
That on life's toilsome road,
Bears onward to the destined goal
Its heavy, galling load;
Rest unto eyes that often weep
Beneath the day's broad light,
Or oftener painful vigils keep
Through the dark hours of night!
But let us bear with pain and care,
As ill to be redrest,
Relying on the promise fair—
'In heaven there will be rest!'

The Quaker poet, Bernard Barton, if not destined to rank high among the poets of his country, has at least won a modest niche in the great temple; and his works will probably be read hereafter, and admired for their purity and delicacy of sentiment and expression, even when the works of much more ambitious sectators of the muses have passed away into oblivion.—*Living Age*.

POWER OF THE VOICE OVER CHILDREN.

It is usual to attempt the management of children either by corporeal punishment, or by rewards addressed to the senses, or by words alone. There is one other means of government, the power and importance of which are seldom regarded. I refer to the human voice. A blow may be inflicted on a child accompanied by words so uttered as to counteract entirely its intended effect. Or the parent may use language in the correction of the child, not objectionable in itself, yet spoken in a tone which more than defeats its influence. Let any one endeavor to recall the image of a fond mother long since in heaven. Her sweet smile and ever clear countenance are brought vividly to recollection. So also is her voice; and blessed is that parent who is endowed with a pleasing utterance. What is it which lulls the infant to repose; it is no array of mere words. There is no charm to the untaught one in letters, syllables, and sentences. It is the sound which strikes its little ear, that soothes and composes it to sleep. A few notes, however unskilfully arranged, if uttered in a soft tone, are found to possess a magic influence. Think ye that this influence is confined to the cradle? No, it is diffused over every age, and ceases not while the child remains under the parental roof. Is the boy growing rude in manner, and boisterous in speech? I know of no instrument so sure to control these tendencies as the gentle tones of a mother. She who speaks to her son harshly, does not give to his conduct the sanction of her own example. She pours oil on the already raging flame. In the pressure of duty, we are liable to utter ourselves hastily to our children. Perhaps a threat is expressed in a loud and irritating tone. Instead of allaying the passions of the child, it serves directly to increase them. Every expression awakens in him the same spirit which produced it. So does a pleasant voice call up agreeable feelings. Whatever disposition, therefore, we would encourage in a child, the same we should manifest in the tone with which we address them.—*Christian Reg.*

CURIOUS SCIENTIFIC FACTS.

A slight blow is sufficient to smash a whole pane of glass, while a bullet from a gun will only make a small round hole in it; because in the latter case, the particles of glass that receive the blow, are torn away from the remainder with such rapidity that the motion imparted to them has no time to spread further. A door standing open, which would readily yield to a gentle push, is not moved by a cannon ball passing through it. The ball in passing through overcomes the whole force of cohesion among the atoms of wood, but its force acts for so short a time, owing to its rapid passage, that it is not sufficient to affect the inertia of the door to an extent to produce motion. The

cohesion of the part of the wood cut out by the ball would have borne a very great weight laid quietly upon it; but suppose the ball to fly at the rate of twelve hundred feet in a second, and the door to be one inch thick, the cohesion being allowed to act for only the minute fraction of a second, its influence is not perceived. It is an effect of this same principle that the iron head of a hammer may be driven down on its wooden handle, by striking the opposite end of the handle against any hard substance with force or speed. In this very simple operation, the motion is propagated so suddenly through the wood of the handle, that it is over, before it can reach the iron head, which, therefore, by its own weight, sinks lower on the handle at every blow which drives the handle up.—*P. Ledger.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SIXTH MONTH 4, 1859.

DIED, at his residence, in Lower Makefeld, Bucks county, Pa., on Fourth-day, 30th of Third month, 1859, from the effects of a stroke of paralysis, ROBERT LONGSHORE, a well-known and highly esteemed citizen, aged about sixty-three years. He left his house on Second-day previous, apparently as well as usual, but was found, in a short time, some eight miles distant, where he had gone to transact some business, lying in his carriage, entirely unconscious, completely paralyzed, and unable to move or speak. He was removed to his home, where he expired on Fourth-day, about eleven o'clock, after an illness of only forty-eight hours.

—, In Ashton township, Delaware Co., Pa., on the 10 h of 5th month, ELIZABETH W., wife of Preston Eyre, in the 46th year of her age, a member of Concord Monthly Meeting.

—, In Middletown, Bucks county, Pa., on the 15th of 5th month, after a short but severe illness, ANN D. wife of Mardon Wilson, in the 67th year of her age, a member of Middletown Monthly Meeting.

A friend in New York, has kindly sent us the following communication.

For Friends' Intelligencer.

The Yearly Meeting of New York convened at Hester street Meeting House, on 2nd day the 23rd of 5th month, 1859. The Men's Meeting being held in the basement of the building, and the Women's in the much more convenient and comfortable apartment in the story above. A most solemn and precious silence covered the Meeting before a word was spoken, when an ancient Friend rose and adverted to the state of Society in the present day, as compared with that formerly, when the Divine Master said to Peter, Satan hath desired to have you, that he might sift you as wheat; but I have prayed for thee, that thy faith fail not—and the prayer has gone up to Heaven for us of this Annual Assembly, that our faith shall be suf-

ficient—and that it fail not—and when we are “converted that we may strengthen the brethren.”

The strangers in attendance from other Yearly Meetings are Nicholas and Margaret Brown, from Canada, Restore S. and Rhoda O. Lamb from Mount Holly, N. J., Joseph and Elizabeth Foulke, from Montgomery county, Pennsylvania, Ann A. Townsend from Philadelphia, John Hunt from Rancocas, N. J., and Samuel and Mary Caley, from Philadelphia.

The Meeting of Ministers and Elders convened on the 7th day preceding at the same place. There were two sittings of this Meeting, one in the morning and the other in the afternoon, in both of which there was exhibited much unity of feeling and sentiment, and it was apparent that the unslumbering Shepherd of Israel had deigned to be present, and encircle the hearts of his faithful dedicated ones with his love. It was a time of much favor, and all could acknowledge that it was a precious, strengthening good meeting. It was observed by a friend that “the shout of a king was in our midst.”

On 1st day, both morning and afternoon, our Meeting-houses were all open for public worship, and an unusually large number of Friends and others were present. The wing of ancient goodness was mercifully spread over us; and it was declared that as the power of the Lord formerly was not in the wind, the fire, nor the earthquake, neither is it now in the noise, the confusion, nor the bustle of the world—but it is known and felt in the cool of the day. It is ever to be witnessed. Oh! blessed forever and ever be His name, which is His power, in the still small voice in the secret of the soul; and all are invited to this secret, wonder-working power—the power of the Highest in the soul. The people were also invited to come and partake of the waters of life freely. There is not, and in the nature of things cannot be, any thing like a sectarian spirit in the gospel, for it is, as it ever has been the power of God unto Salvation, to every one that believeth. We were also feelingly reminded that if one-half of the time and exertion were made to fit and prepare us for a glorious immortality, for a companionship with angels and purified spirits in Heaven, that are consumed in amassing the treasures and enjoying the pleasures of this fleeting life that the aspect of the Christian church would be very different indeed from that we now find it to be.

On Second-day morning, Epistles were read from all the Yearly Meetings with which we are in correspondence, much to our edification and comfort. In all these testimonials of love and Christian regard there was a reverent acknowledgment of the superintending care of the Head of the Church. There was a proposition made to the meeting, that men Friends should adjourn to the 27th street Meeting-house, but in con-

sidering the matter, way did not open to make any change. It was concluded that the sittings of this Yearly Meeting should convene at 10 A. M. and 4 P. M., the same as last year.

An interesting Report was read from the Committee on the Indian concern, from which it appears that the Indians, under the care of the Yearly Meeting, have become somewhat unsettled during the past year, by efforts which have been made to induce them to leave their comfortable homes in the western part of this state, and emigrate to the far and inhospitable regions of the west; but these efforts have been counteracted by the influence of Friends, and there is now reason to believe that the scheme of emigration has been abandoned, as at their late elections none have been placed in office who were favorable to the emigration movement. Thus have the Society of Friends once more reason to believe that their care and attention has been serviceable to this much injured people. There was a concern introduced into the Meeting that our long and well-known testimony against slavery might be faithfully maintained, and Friends were reminded that that testimony was a righteous one, and in order that it might be borne in its purity before world, so as to avail much, it was necessary to keep in and under the Divine influence and power—creatively activity can never exalt this noble testimony, neither can any work of righteousness be performed acceptably to the Father of Spirits in the unsanctified will and strength of man—but our sufficiency must be from God, and we must wait his appointed time, and the all-qualifying power of His Holy Spirit. Our testimonies against War, Intemperance, Priestcraft, Tobacco, and the love of Money, also claimed the attention of the Meeting, and much pertinent counsel and advice were handed forth concerning them.

The meeting concluded to publish, in book form, the memorial concerning deceased Friends of this Yearly Meeting for a number of years back, including those that may be approved this year, and distribute them gratuitously to the families of Friends within our limits. Several memorials of deceased Friends coming up for approval before the meeting this year, their salutary contents claiming deliberate attention, the meeting was baptized into a state of feeling, and there was a precious solemnity spread over the minds of Friends more powerful than words can express. It was remarked after the reading of the one from the Monthly Meeting of New York, concerning our beloved Friend, Caroline Willets, that the solemnizing effect produced thereby was so precious that any additional expressions would tend to dissipate, rather than increase it; not long after which an aged stranger observed that many Friends have done virtuously, but thou, dear Caroline, excelleth them all.

It is I believe a very prevalent feeling that in

both the Men's and Women's Meeting, we have been favored to sit in heavenly places. Many have expressed the sentiment that it is the best Yearly Meeting they have ever attended; Oh! that all could adopt the language of the poet, in his address to Deity,

“Naught but the effluence of thy power Divine,
Pervading worlds, hath reached my bosom too.
Yes, in my spirit doth thy spirit shine, as shines the
sunbeam in a drop of dew.”

A measure and manifestation of this spirit has been known and felt among us, uniting us together in the bond of peace. At the conclusion the Clerk read the following minute: The business of the Meeting being brought to a close, we acknowledge the superintending care of the Head of the Church, baptizing us into much unity of feeling and brotherly love, in the several sittings of this Yearly Meeting. Grateful for the favor, we take leave of each other, concluding to meet again at the usual time next year, if the Lord permit.

TANNER'S LECTURES.

(Concluded from page 171.)

It would be easy to multiply evidence of the low spiritual condition of the Society in the middle period of its history, from the records of the Meetings for Discipline: and a similar testimony is borne by a manuscript journal kept by John Player, of Tockington,† of a visit paid by him, in 1760, to the western counties, &c., as a member of the Yearly Meeting's Committee, the first, I believe, which was appointed to such a service. In speaking of Bristol, John Player alludes to the poor attendance of the Week-day Meetings for worship, and to the smallness of the Meetings for Discipline. Of the Somersetshire Meetings he says, “Things appeared exceedingly cloudy and heavy—occasioned, we are jealous, by too close an attachment to the profits and spirit of the world.” It is worthy of notice that this committee advised the junction of some of the Dorsetshire Meetings, which had become very small and weak, to Somersetshire, a measure which has been recently adopted. The account given by John Player, of the state of other Quarterly Meetings, shows that the declension to which I refer was of a general character. That men like those who labored in this service, were found to undertake it, proved that the spiritual life of the body was not extinct, and many were prepared to co-operate in their labors for the restoration of the health of the body. Frequent reference is made to serious-minded young men and women with whom the committee held intercourse in the different meetings. It must, however, be acknowledged, that as respects the Society at large, the

* This journal has been kindly lent me by Fanny and Mary Player.

condition of things was exceedingly low; and even suggestive of an inquiry like that addressed to Ezekiel, "Son of Man, can these dry bones live?"

A statement lately published in the *Times* newspaper, seems to imply that our recent history answers this inquiry in the negative: this I am not disposed to admit. I allude to an advertisement in which prizes are offered for an essay on the subject of the decline of the Society of Friends. The gentleman who offers these prizes states, that our Society has lessened in numbers during the first half of the present century, and also expresses his belief that the Christian testimony which it has borne to the world "*has been gradually becoming more and more feeble.*" The first part of the statement is probably correct, and certainly calls for the most careful and searching inquiry on *our part*, whatever the world at large may say about it; but I think that no one who carefully considers the history of our Society, during the last half of the eighteenth and the first half of the nineteenth century, can doubt that a much more healthy condition prevailed in the latter than in the former period; or that our Christian testimony has in some respects become clearer and stronger.

There is no doubt that we have been for some time past in a state of transition. In one sense, this state is common to all living bodies; the maintenance of life having been made to depend on the removal of decayed, and the substitution of new particles. But there have been some special influences at work upon our Society of later times, the tendency of which has been to modify the condition and feelings of our members in a variety of ways, but which ought not, and it is to be hoped will not, have the effect of turning us aside from our Christian calling. I must now briefly advert to some of these influences. The *philanthropic efforts* of different kinds, in which many of our members have been led to engage during the last seventy years, have exerted a marked, and, I believe on the whole, a very beneficial influence upon us. Philanthropy may sometimes have engrossed the time and talents which should have been devoted to services more exclusively appertaining to the Gospel of Christ. But it would be a very narrow view of the requirements of the Gospel, which would lead us to reject any legitimate means by which the moral and physical condition of our fellow-men may be improved. Among the benefits which we ourselves have derived from taking part in such efforts, it may be mentioned that many have had their minds thereby diverted from the engrossing pursuits of trade; that opportunities have been thus afforded for the expenditure of means, the accumulation of which would have proved injurious; and that our sympathies have been enlarged, not only towards those on whose behalf we have labored, but also

towards our fellow-laborers of other denominations of Christians. If time had permitted I would gladly have dwelt more at length on some of these efforts.

We had an interesting lecture given us twelve months since, on the Slavery of the Old World, and the relations of Christianity to it; and I wish that it could be followed by a description of the part which the Society of Friends has taken in the work of abolishing *modern slavery*. In T. Clarkson's History of the Abolition of the Slave Trade, there is a very interesting account of the visit which he paid to Bristol, about the year 1787, for the purpose of collecting evidence on the evils of the Slave Trade. He mentions by name many Friends by whom he was introduced on coming to Bristol, and he remarks that "the Quakers to a man were strenuous, and this on the best of principles, in support of the abolition movement." During that visit, T. Clarkson had need of all the countenance and support which could be given him. Many nights, as well as days, were spent among the crews of the slave vessels, in the low public houses in Marsh street, which were their places of resort; and the obstacles which impeded his various inquiries were of a formidable character.

I would also fain have spoken more at length of another movement of a philanthropic character, in which, as far as England is concerned, Friends may be said to have taken the lead. I allude to the amelioration of the treatment of the insane. I could not, however, have hoped to do full justice to the subject, even by a more lengthened reference to the importance of the work accomplished by William Tuke and his successors, in not only exposing the miserable abuses of the old lunatic asylums, but in exhibiting in "The Retreat," established near York, in 1792, an example of what might be effected by the extension of kind and judicious care to these children of affliction.

Friends have borne a part in other philanthropic enterprises of more recent date, in which the communication of *religious instruction* has formed a prominent feature. I allude particularly to the Bible Society, the British and Foreign School Society, and the Prison Discipline movement. The amelioration of our criminal code, which George Fox was one of the first to suggest, and the abolition of the punishment of death, have been objects of deep interest to many Friends. As respects our local charities, it is needless for me to dwell on the assistance afforded them by Richard Reynolds, and by others who in more recent times have followed his example. Although it is true that we were behind some other bodies of Christians in entering on the work of Sabbath School instruction, I believe we have derived very great benefit from the part which we have taken in connexion with it. If I were asked to mention the most beneficial influ-

ence of an external kind which has, in modern times, been brought to bear on our Society in Bristol, I should have no hesitation whatever in answering, *that of the First-day School.*

The establishment of Ackworth and other schools, in which the education of many of the children of our own members, was placed under the direct care of the Society, formed an important epoch in our history. Not less important was the change effected, at a later period, in the instruction given both in our public and private schools, by the introduction of a course of Scriptural teaching; a change which was accomplished, to no small extent, through the labors of the late Joseph John Gurney.

I cannot but think that a corresponding benefit has resulted from the giving up of the exclusive system which characterized the Meetings for Discipline in former days. I regard it as one of the most hopeful signs of the present state of our Society in Bristol, that many of our younger Friends are not only devoting themselves to the promotion of philanthropic efforts, but are willing to bear their part in the affairs of our own Society. Of the younger men and women, who in the early part of the present century, were instrumental in the infusion of new life into the Society, in this country, many became qualified to bear a part in the ministry of the Gospel. We can ourselves recal the persons and services of more than a few, of whom it may be said that they were gentle among us, even as a nurse cherisheth her children, and that being affectionately desirous of us, they were willing to have imparted unto us not the Gospel of God only, but also their own souls, because we were dear unto them. The inquiry as to where, and on whom the descending mantles of these faithful laborers are to rest, is one which may well engage our anxious thought. The qualification for such service cannot be bestowed by man; but it is for us to see that we do not disqualify ourselves for the reception of spiritual gifts, and to labor for the removal of all those stumbling-blocks which prevent the word of the Lord from having free course amongst us.

I think no one can feel more strongly than I do, that *boasting* should be altogether excluded from our consideration of both the past and present state of our religious Society; but we surely have cause for reverent gratitude, that He who appointed us a place to occupy, and a work to do in the great family of the Church, has continued towards us His faithful care. I am not one of those who think that our calling and responsibility, as a distinct section of that Church, is about to cease. Whether we be faithful to the call or not, I am fully convinced that there is still a place and a need for a body of Christians who should bear before the world a testimony to the *entirely* spiritual character of the New Covenant Dispensation—to the authority of Christ as dis-

tinguished from the authority of man in matters of religion—to the freedom of that Gospel ministry which is to be received as a *gift* from Him, and to be exercised in the strength which He bestows—and to the peaceable character of His kingdom.

In saying this, I feel no disposition to ignore the fact that the general condition of the professing Church has greatly improved since the days of George Fox. I rejoice that it is so; but I am well convinced that if we would contribute our share to the general improvement, we must maintain *our own ground*. Let me not, however, be understood to speak of a traditional adherence to the profession made by our forefathers. Many influences have been at work, of late, in the Society of Friends, as well as in the Church of Christ at large, tending to the demolition of *traditional faith*, and we shall have occasion to rejoice in the result, if tradition be replaced by a new growth of individual conviction. Christianity is a vital influence, and not a mere system of opinions, and cannot therefore be effectively maintained under any form of profession, by the teaching which one man gives to another, or which one age hands down to another.

It is certainly a critical period, whether it occur in the life of an individual, or in the history of a Church, in which the unhesitating faith of *childhood* comes to be disturbed by doubts and questionings, such as must inevitably precede the independent conviction and sound judgment of *manhood*: a period in which there is peculiar need for the exercise of watchfulness and teachableness of mind on the one hand, and of forbearance and condescension on the other. Religious conviction implies much more, indeed, than an assent to certain propositions; and, if we would be prepared to bear a faithful testimony to the truth of the Gospel, it is essential that our own hearts should be made subject to its regenerating and transforming power: that, being ourselves made partakers of the mercy of God in Christ Jesus, we should become truly subject to him as our Lord, and know our hearts to be influenced by his constraining love, and our wills subjected to His pure and holy will. Let us not propose to ourselves any inferior aim, either in regard to the means by which we would seek to fulfil our duties, or the strength in which they should be discharged, than that which is set forth in the words of the apostle—"by pureness, by knowledge, by long-suffering, by kindness, by the Holy Ghost, by love unfeigned, by the word of truth, by the power of God, by the armor of righteousness on the right hand and on the left."

In conclusion, I may confess that my own love for the Society of Friends has been afresh warmed by this investigation of its early history; but I trust that the feeling is not one which arises from sectarian narrowness. The love which the *true patriot* feels for his country, is something

added to, and not subtracted from his love of the world at large; and I cannot but think that a corresponding feeling of *especial interest* in that portion of the Church in which our own lot is cast, is quite consistent with the desire, that "grace" may be "with all," of every name and of every nation, "who love our Lord Jesus Christ in sincerity." But how much is there in the divisions which now separate between the professed followers of Christ, and in the imperfections which attach to them all, which should make us rejoice in the thought of that state of heavenly rest and blessedness, where, in a far higher sense than can be applicable to the Church on earth, "Christ is all and in all."

"DIFFERENT ROADS TO THE SAME END."

If thy brother, on life's highway
Choose a path apart from thine,
Thou a straight, and he a by-way,
Both may reach the wish'd-for shrine.

Thy work lies among the mountains,
His may be in vales below;
Thou mayst drink at sparkling fountains,
He where gentle waters flow.

Thou may'st pass the things unheeding,
That to him are treasures spread,
Crushing, as thou art proceeding
Flowers, that fragrant odors shed;

Buds that bloom for him in beauty,
Things for which thou canst not care,
In thy rugged path of duty,
On thy mountains high in air.

Neither, then, should scorn the other;
There are duties calling each;
Cherish thine, but let thy brother
Keep his vale, nor higher reach.

Thou may'st minister to natures,
High, aspiring as thine own;
He to earth's more humble creatures,
On thy pathway rarely known.

While thou'rt weighing mighty causes,
He may mark each grand effect,
Yield his faith without thy pauses,
Nature love, but not dissect.

Thou may'st prove the High Creator
Great, by earth, sun, moon and star;
He an untaught, mute spectator,
Only thank Him that they are.

SHARON, 4th mo., 1859.

S. R. S.

DESPISE NOT SIMPLE THINGS.

Despise not simple things;
The humblest flower that wakes
In early spring to scent the air
Of woodland brakes,
Should have thy love as well
As the blushing parlor-rose,
That never felt the perfect breath
Of Nature round it close.

Despise not simple things;
The poor demand thy love
As well as those who in the halls

Of splendor move,
The beggar at thy door,
Thou should'st not e'er despise;
For that may be a noble heart,
Which 'neath his tatters lies.

Despise not simple things;
An ant can speak of toil;
The butter-cup can light the heart
With its sweet smile;
'Tis not the tow'ring mount alone
That high thought to us brings;
There's something noble and sublime
In the love of simple things.

[The following lines were written by a young woman not a member of the Society of Friends, after having attended a silent meeting.]

FRIENDS' SILENT MEETING.

There sits a group in silence how profound!
There reigns a holy, heavenly calm around!
Unbroken, save by casual passers by,
Which cause a moment's wandering of the eye;
Convened apart from bustle, noise and strife,
Forgotten are the ills and cares of life.
No thrilling eloquence falls on the ear,
No chorister's inspiring music near,
No pealing anthem swells upon the air,
No useless rites or idle forms are there;
In solemn silence are their praises given,
And aspirations holy mount to Heaven.
A holy influence seems shed abroad
O'er contrite hearts, in converse with their God.
With pure devotion and with heartfelt prayer,
In spirit and in truth they worship there.

For Friends' Intelligencer.

NATURAL HISTORY OF BIRDS.

BY YARDLEY TAYLOR.

While I do not profess to be able to write a scientific essay on the natural history of birds, I wish to excite an interest in their preservation, particularly with the young readers of the *Intelligencer*. When we examine into their habits, and see the advantages that result to the agriculturist and the horticulturist by their labors, he must be lost to all sense of utility who would wantonly desire their destruction. They are our best friends, and while benefitting us they cheer us with their melody. Who can listen unmoved to the songs of the feathered race, during the spring and summer months, while sojourning with us, and rearing their young? Audubon, Wilson, and other naturalists, have given us their descriptions in glowing and beautiful language; but glowing and beautiful as it is, the lover of nature will bear witness that it is not exaggerated. But the greatest benefit resulting to us from their presence, is in their living principally on insects. The large number of the birds continuing with us during the season, use this kind of food almost exclusively. Insects do an immense amount of injury to the farmer and orchardist, and were they not preyed upon by birds, it is doubtful whether they would not cause a famine even in

this country. In the neighborhood of large cities, where idle men and boys shoot the birds, great injury is sustained by the tiller of the soil on this account.

The legislatures in some of the States of this Union have prohibited the destruction of small birds under heavy penalties, and it would be wise if all were to do so. Some persons object to some kind of birds, because they get a share of their cherries and other small fruit, but if they would study the habits of these birds and their food during the remainder of the season, they would find that they do far more good than harm, and would be willing to plant some cherry trees for their use.

A short time since the Massachusetts Horticultural Society proposed to consider the question, whether the robin was beneficial or injurious to the horticulturist. An entomologist was appointed to investigate the subject, and report upon the question. To do this he noted the first appearance of that bird, and by having some of them killed at different times of the day and throughout the season, and carefully examining the crop and gizzard of the bird, he ascertained its food during the entire season. In the early Spring its entire food, or nearly so, was the larvæ of insects peculiarly injurious to vegetation, such as that of the wire worm, &c.; no vegetable remains were found. Later in the season worms and caterpillars were met with, and in the fruit season some remains of fruit were seen, while late in the season the remains of insects showed that they were its chief food. Farmers sometimes charge the birds with pulling up their young corn, to obtain the grains at its root for food. This charge is not always well founded. A neighbor of mine some years ago had a field of young corn that he found would want a good deal of replanting, and charged the birds with part of the mischief, and having a little leisure one day he thought he would prevent further damage by shooting them. On arriving at the field he saw a jay bird fly up from the ground, and alight on the fence near him. Before he could shoot the bird, it made a convulsive motion with its head, as if throwing up something on the fence rail. After shooting the bird he felt a curiosity to see what it had thrown up, when to his surprise he found a mass of mutilated cut worms, with which the bird had probably overloaded its stomach. He concluded if that was what the bird were after, he was doing himself a serious injury by destroying them, and returned home determined never to kill birds again for pulling up corn. Birds congregate where food is plenty. During the past year when the grasshopper increased so rapidly in Bucks county, Penna., as to injure their pastures seriously, the field plover, a rather rare bird commonly, came there in large numbers and fed on these insects. A good many years ago the or-

chard caterpillars became very numerous here, injuring the apple trees materially by consuming the leaves. While doing this, the birds from the woods that do not usually frequent the orchards, came into them, and picked the worms out of their nests, so that there has hardly been seen a caterpillar's nest here since. In England they have a bird called the Jack Daw, somewhat similar to our crow, but smaller. Many years ago they imagined this bird was doing an injury to the farming interest, because they were sometimes found feeding on grain. Accordingly they offered a premium for their scalps. This stimulated the marksmen, who thinned their numbers. But they soon had reason to repent of their rashness, and had plenty of time to repent of it before they could remedy the evil they had inflicted. They have also an insect called the cockchaffer, that lives most of its time in the ground, in the form of a grub worm, feeding on the roots of plants. This cockchaffer is a favorite food of the Jack Daw, and by lessening the number of the birds, they increased the number of the worms, so as seriously to injure the farming interest. The many birds frequenting our meadows and pasture fields, are searching for insects and their larvæ, and thus preventing their increase. Should we not then be careful of them and encourage them to remain with us as much as possible? For my part I provide places for them to build in, and encourage them in every way, and exert myself to prevent their destruction. In doing this I may incur the displeasure of the idle and thoughtless, but I am sure of meeting with the approval of the considerate lover of nature, and of those who look at things aright.

Most of the birds that pass the Summer with us, spend the Winter farther south; their appearance gives evidence of the advance of Spring. Some make their appearance on the first approach of warm weather, while others wait till the season becomes more settled. During Winter we have the sparrows and snow birds. The former a brownish bird with a long tail, the latter pale sky blue above, and lighter color beneath, with a moderately long tail. They feed in winter on the seeds of weeds, and are very busy previous to and after snow storms. They roost in winter in the side of stacks of grain, hay, straw, fodder, or any thing of the kind. By spreading a net over fodder stacks after night, they may be caught in considerable numbers. The sparrow continues with us during summer, and breeds here, but the snow bird is not so plenty as in winter. Their food in summer is mostly insects. The sparrow builds its nest in low trees, bushes, and sometimes on the ground, or under the edge of a tuft of grass; the nest is composed of fine grass, or sometimes horse hair, in which they lay four or five small speckled eggs.

One of the earliest birds that makes its ap-

pearance in spring is the robin, and they are perhaps as numerous during summer as any other. They pair early and build quite substantial nests. These are composed principally of clay, mixed with straw, grass, &c., and are lined inside with soft grass, and such like substances; they lay generally four or five blue eggs. They select a firm foundation for their nests, the corner of a fence, the fork of a tree, or large bush.

There are three varieties of black bird common here, the large or crow black bird, the red wing black bird, and the cow bird. The first is the largest, of a jet black color, and with a long tail; it builds its nest in tall trees, and forms it a good deal like the robin, only made of coarser materials. They have the credit of pulling up corn, and are not looked upon with much favor by the farmers, yet I am inclined to believe that they do much more good than harm; they are insect-eating birds, and even if they do injure the farmer in that one case, it is the only one, and may be overlooked, when we consider that its food for the remainder of the year is insects, and that they must consume no small amount of them. They are not considered songsters, having few notes, and one of these performed apparently with considerable muscular effort, spreading their tail and other feathers in its performance. Other black birds go through the same movements in producing similar notes. There is only a little difference in size but not much in color, between the male and female of this variety; the male rather large.

The red wing black bird is smaller than the preceding. It is only the male that has the red spot on the shoulder of the wing; the female is of a brown color, and smaller than the male. They frequent low grounds and meadows, and often build their nests in a bunch of upright growing weeds or bushes. This they do by using tough pieces of grass, and tying it round the stems of the plants, and weaving it through and around the nest quite curiously, thus making a very strong and secure nest for their young. Their eggs are pale blue. The male is quite courageous, and will not allow other birds to approach the nest without opposition; they will follow and stick at them with their wings, and when they are far enough off to be out of danger, they will leave them, and sail back chattering, as if proud of the performance. But should a cat, a mink, a weasel, or a black snake, or some such enemy approach the nest, the parents will fly around uttering plaintive cries, as if much alarmed, and when the neighboring birds hear such cries they too come and join in the cry; even different kinds of birds will do this, thus proving that they know the cry of distress of each other, and are willing to help, and they will follow the enemy until out of danger.

The cow black bird is less than either of the other two. It probably takes its name from the

fact of their being often seen in the presence of cattle, while they are feeding in pasture fields. Whether these birds are attracted to the cattle by the presence of flies that usually accompany them, or whether the movements of the cattle disturb other insects, upon which they prey, is difficult to decide, but certain it is there is something that induces them to seek the presence of stock in pasture fields.

These birds appear to be fond of society, especially the large black bird. I once knew a nursery that had been suffered to grow up until it became a dense thicket of perhaps half an acre, and here these birds from all parts of the neighborhood would congregate to work at nights, making a great chattering; this continued for years, until the thicket was cut down. In the fall of the year these birds gather together, sometimes to the number of thousands before leaving for the south. They are probably then on their way, as we seldom see them here long after.

(To be continued.)

From the N. Y. Tribune.

LIBERIA.

The last annual message of President Benson to the Legislature of Liberia, now before us, is a document very creditable to the author. Though not born in the Colony, President Benson was carried thither by his parents at an early age, and in the first days of the settlement, and may therefore be fairly taken as a specimen of what it can produce. He obtained his education in the common schools of Liberia, and at the age of fifteen was appointed a clerk in the Government store. From that he rose to be a trader on his own account, becoming an owner of vessels, a large coffee-grower, and a leading merchant. Having served in the Legislature, he was, when the Colony became self-governing, elected President, in which office he gave so much satisfaction as to be re-elected without opposition. In point of phraseology, good taste and good sense, his message is quite up to the current standard of Governors', and, for that matter, of Presidents' messages, on this side of the Atlantic.

The condition of Liberia, as represented in this message, appears to be decidedly prosperous and progressive. The crops have been unusually large and diversified. The camwood and palm-oil trade have prospered; and, though Liberia has felt the commercial depression, it has had, at least, the good effect of turning attention to the development of her internal resources. The President strongly urges the establishment of interior settlements, and the future employment of immigrant labor in agriculture. The Liberian National Fair of 1857 produced an excellent effect in that way, and the President recommends

that such an annual fair be made a permanent institution. Some contributions toward prizes have been made from the United States, and the Manchester Cotton Supply Association has appropriated \$120 per annum, for four years, for the four most satisfactory samples of cotton raised in Liberia each year, beside four medals as second class prizes. A supply of cotton seed, represented as of a superior kind, has also been sent out by the British Government.

The President urges the duty of the Legislature to take steps for elevating and improving the native tribes within the Liberian territory—a subject, it appears, which has, for two years past, attracted much attention, and in which the leading native chiefs profess a readiness to cooperate. President Benson is well satisfied of the feasibility of gradually assimilating the manners and customs of the aboriginal population to those of civilized life; and he is confirmed in this view by the progress in that direction actually made in past years. He is opposed, however, to the establishment of any distinct or separate system of training or education for this class—not only as calculated to keep up a line of demarcation between immigrants and aborigines, which, on the other hand, it is desirable to abolish, but because, in his opinion, this training and instruction are just as much needed for the immigrants coming from America, and their children, as by the aborigines themselves. He refers to it as a well known and undeniable fact that there are thousands of natives within the jurisdiction of Liberia who are intellectually in advance of at least half the immigrants who arrive annually from the United States; from which state of facts it would seem that the civilizing influences of slavery—almost all these immigrants being emancipated slaves—are not quite so great as they have sometimes been represented.

A liberal postal convention has been made with Great Britain, which has also presented Liberia with a vessel to act as a *guarda costa* to supply the place of one sent to England for repairs, but found unseaworthy. A reciprocity treaty has also been negotiated with Belgium. The rapid increase in the ship-owning interest of Liberia, and the possession of vessels large enough to be employed in the trade with foreign nations, give these reciprocity treaties increased importance, and the President anticipates that, before many years, the import and export trade will principally be carried on in Liberian bottoms.

President Benson loudly complains of the expense to which Liberia is put to guard against the prosecution of the slave trade on her coast under pretense of obtaining free emigrants for the French colonies; but he is satisfied that, so soon as the French Emperor can be made to understand the real facts of the case, these annoyances will be discontinued.

THE WINTER IN SOUTHERN EUROPE.

One of the editors of the *New York Post*, who is now in Europe, in a letter from Genoa gives the following information for the benefit of tourists:

“Let any one who wishes to visit France, or Italy, ‘pray that his flight be not in the winter.’ He will suffer more from cold here in one month than in the more northern latitudes in an entire winter. Not that the weather is any thing like as cold here, but the means of keeping warm are so imperfect. The houses all, and the floors for the most part are stone, the inside walls are never ‘roughed’ as with us, but the plastering is placed directly on the stone; the fire places are usually very small, and so constructed that the largest proportion of whatever heat is generated in them goes up the chimney, while the doors and windows are so badly fitted that they afford little or no obstruction to the air, which is pretty much the only thing that circulates on the continent with freedom. The consequence is, that when one enters a house he feels as if he was entering a cellar, and no amount of prudence can guard an unacclimated stranger from the effects of sitting or sleeping in such rooms, and walking in the narrow cavernous streets into which they open. The cities near the mountains, like Turin, Genoa, and Florence, are specially objectionable in these particulars. Their streets feel like vaults, they are so narrow and so damp.

It is the nature of pride to expose what is likely to increase its own reputation, and conceal its defects; but *true* humility is willing to appear *what it is*, and is more afraid of being over than under-rated.

A *real* seeker after truth, disguises *nothing*; he is not, therefore, offended at a detection of error, *even in himself*, because he knows that if truth be gained, he shall partake of the benefit.

ITEMS OF NEWS.

TELEGRAPH.—Cyrus W. Field sailed on the 25th ult. for England, to resume his labors, in connection with the London Company, in the preparation of a cable to be laid across the Atlantic the next year.

JAPAN.—Siebold, the Japanese traveller, and the author of the most comprehensive work ever published on Japan, in 5 parts, total cost about \$900, has returned to Japan, where he will be invested with important functions by the Dutch Government.

CAPE OF GOOD HOPE.—Pertz, Director-in-Chief of the Berlin Library, asserts, in a recent publication, that the Cape of Good Hope was discovered by the Genoese 200 years before Vasco de Gama or Bartolomeo Diaz.

THE late flood of the Mississippi and Yazoo rivers has been almost unexampled in the damage it has done to the cotton planters. Many thousands of acres of the best cotton lands are overflowed and rendered

unproductive during the present season, including the famous Deer Creek Bottoms, noted for their fertility

AFRICA.—Barton and Speke, the African travellers, have arrived at Aden from Zanzibar. They penetrated into the country about 700 miles from the coast, and surveyed the famous Lake Uniamesi, and several other lakes in the same longitude. Their researches tend, in some degree, to dispel the doubts which have so long hung over the sources of the Nile.

POST OFFICE DEPARTMENT.—A thorough reconnoissance of all the mail routes is being made at Washington with a view to the curtailment of expenses at every point where it is practical, without serious detriment to the public. While in many cases the service has been altogether discontinued, in others the number of trips has been reduced from daily to tri-weekly, weekly, &c. Acting on this principle, the Post Office Department has, within the last two months, effected an annual saving of about a million and a half dollars, exclusive of five hundred thousand economised by the refusal of the Postmaster General to put into operation the nearly seven hundred routes created in 1858, but for the support of which no appropriation has been made.

The work of curtailment is still progressing. It is not probable, however, that the service will be curtailed on any of the railroad lines.

PIKE'S PEAK.—The St. Joseph correspondent of the St. Louis *Democrat* notices the arrival at that place, of 100 Pike's Peakers, who give deplorable accounts of mining prospects and suffering on the Plains. It is estimated that 20,000 men are now on their way, all or most of whom, destitute of money and the necessaries of life, are perfectly reckless. Desperate threats are made of burning Omaha, St. Joseph, Leavenworth, and other towns, in consequence of the deception used to induce emigration. Two thousand men are reported fifty miles west of Omaha, in a starving condition. Some of the residents of Platemouth have closed up their business and fled, fearing violence at the hands of the enraged emigrants.

THE INVENTOR OF LUCIFER MATCHES.—John Walker, of Stockton, England, recently died at the age of seventy-eight. A Journal of the neighborhood says that this match discovery was made by John Walker while experimenting with various chemical substances, and for a considerable time he realized a handsome income from the sale of his matches in boxes at 1s. 6d. each. Professor Faraday, being in the North, heard of the invention, and in passing through Stockton, obtained a box, which he took with him to London; advertising to it in one of his lectures, the discovery became famous, and was soon put to practical use everywhere.

The official majority in Massachusetts for the constitutional "amendment" requiring two years residence after naturalization before a person can vote, is five thousand six hundred and twenty-four, out of the total vote of thirty-five thousand eight hundred and eighty-two.

WESTERN SETTLEMENT.—A colony numbering nearly a thousand Norwegians and Swedes are about removing from Illinois to Minnesota.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Flour is quiet and steady, without any material change in prices. Sales of good superfine are reported at \$7; common extra at \$7 25, and good Western extra at \$7 75. The sales to the home trade are limited between \$6 75 and \$8 75 for fancy lots. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 75, and the latter at \$4 per bbl.

GRAIN.—Wheat is in limited demand at a decline.

Sales of Pennsylvania and Western red at \$1 60 a 1 66, and white at \$1 75 a 1 80. Rye is steady at 90 c. Corn is in large supply and dull. Sales of yellow at 90 cts. afloat. Oats are in fair demand. Sales of prime Pennsylvania at 50 cents.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks Latin, Greek, French, Penciling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address WM. HICKLEN, Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,

Cheap School Book Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

MARY G. JACKSON, } Assistants.

MAGGIE B. JACKSON, }

Address Kennet Square P. Office, Chester Co. Pa.

WILLIAM CHANDLER, } Proprietors.

SUSANNA G CHANDLER, }

3d mo. 19, 1859.—10 t.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SIXTH MONTH 11, 1859.

No. 13.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.
(Continued from page 179.)

John. This view of the subject is very different from the one I have always entertained, and it appears to me to be inconsistent with many passages of the scriptures of truth, as well as some facts in the present condition of man, which I shall endeavor to state. In the first place, man being created in the image of God, he must have been immortal; not subject to disease nor death, until he tasted the fruit of "that forbidden tree, whose mortal taste brought death into the world, with all our woe." But, having broken the Divine command, he incurred the penalty of death; which sentence was passed upon him when he was expelled from the garden, but the execution of the sentence was deferred for a long period; and he was doomed to eat his bread in the sweat of his face, till he returned unto the ground from whence he was taken.

Secondly. When Adam had eaten of this forbidden fruit, he lost the Divine image of holiness, wisdom, and immortality; and while in this state, his children were born unto him in his own image of fallen nature; consequently, they must have been born in a state of sin, and subject to mortality.

Thirdly. There are many passages in the scriptures to confirm these views of the inherent depravity of man, through the sin of Adam. King David says, "I was shapen in iniquity, and in sin did my mother conceive me." And again, he says of the children of men, "They are all gone aside; they are altogether become filthy; there is none that doeth good, no, not one." The apostle says, "We were by nature the children of wrath,

even as others." It is also said in relation to the world before the flood, that "God saw that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was only evil continually." That this state of depravity was owing to the sin of Adam may be inferred from the writings of the apostle Paul; for he says, "As by one man sin entered into the world, and death by sin, and so death passed upon all men, for that all have sinned." Again, he says, "As by one man's disobedience many were made sinners, so by the obedience of one shall many be made righteous:" for, "as in Adam all die, even so in Christ shall all be made alive." That God does impute the sins of the parents to the children, may be proved from his dealings with the children of Israel; for he said he would "visit the sins of the fathers upon the children to the third and fourth generation."

Lastly. I think these views are confirmed, by observing the actual condition of mankind in the world around us. See how much misery there is, resulting from depravity and sin; what raging passions desolate the moral world; what horrid crimes pollute the characters of men! Surely the destroyer has been here, and has left only a wreck behind, of all that was once so fair and beautiful. Nor is the corruption that reigns around us confined to the adult and the aged; even children seem to partake of it, and the first developments of character are marked with anger and impatience.

Father. I shall endeavor to answer these objections in the order in which they have been stated. And first: I agree that man, being in the Divine image, must have been immortal; but what part of him was made in the image of God? Surely it was not his earthly body; for "God is a spirit," and "no man hath seen his shape at any time." I consider the body as the tabernacle, or house, in which the immortal soul dwells, during its state of probation, and I believe it was so considered by the inspired penman; for Paul speaks of "our earthly house of this tabernacle being dissolved." 2 Cor. v. 1. To say that the sentence of death was passed upon Adam when he was driven from paradise, but the execution of the sentence was postponed for about nine hundred years, seems to me to be a very imperfect fulfilment of the Divine prediction, "In the day thou eatest thereof thou shalt surely die." Let us suppose that Adam and all his posterity

had continued in the body until the present period, and that they had gone on to "multiply and replenish the earth," without any being removed by death; where would the countless myriads have found room for existence? I have no idea that the human body was ever intended to be immortal; for it was made of earthly materials, which are subject to decay; and we know that our bodies are continually changing by absorption and secretion, so that the particles which composed them at one period of life, are entirely removed at another." I do not think the mortality of our bodies is any proof of our being born in a state of sin; for even the holy body of the Messiah was liable to death, or else he could not have been slain. He called his body his temple, saying, "Destroy this temple, and in three days I will raise it up." When I say that "the wages of sin is death" to the soul, I do not mean that the soul of the sinner ceases to exist, but that it ceases to be actuated by the spirit of God, who is the life of the righteous soul: for it is said in the scriptures, that "they who are living in pleasures, are dead while they live." They have lost the influences of Divine life, and are like withered branches, ready to be cut off.

The second objection is founded on the children being born in the image of their parents — Now it is not said in Genesis, that Adam's children were all born in his image; for Seth is the only one mentioned as being born in his father's likeness. It is not an unusual thing, in the present day, for a child to bear the image of his father stamped on his person; but who among us would be so unjust as to impute to children the guilt of their parents, from a circumstance like this? It is said in the apocryphal book of the wisdom of Solomon, that by Divine Wisdom "the first formed father of the world was brought out of his fall;" and if any of his children were born after he was thus restored to the Divine image, can we suppose that these would be purer than the rest? I do not think they would, for we find no such effects in the present day.

I believe that every soul is the immediate gift and creation of God, agreeable to scripture testimony, "The dust shall return to the earth as it was, and the spirit shall return unto God who gave it." Ecc. xii. 7. If therefore the soul or spirit of man be the gift of God, it must come pure out of his hands.

The third objection rests upon passages of scripture, all of which admit of a different interpretation, and one that is far more consistent with the character of a wise and benevolent Creator. A number of these passages speak in general terms of the whole human race, as being in a corrupt or fallen state, which I readily grant was true; but the scriptures themselves mention a number of exceptions. For instance, it is said of man before the flood, that "every imagination of the thoughts of his heart was only evil con-

tinually;" and that "God looked upon the earth, and behold it was corrupt; for all flesh had corrupted his way upon the earth." Yet it is said in the same chapter, that Noah, who was then living, was "a just man, and perfect in his generation," and that "Noah walked with God."

It is very common, even now, to speak of cities and nations in general terms, and to give to a whole people the character which we think generally prevails among them; but no one supposes that in such cases there are not many exceptions. For my own part, I believe that there always have been good people in every age of the world, and that many who have passed through life unnoticed in the vale of obscurity, are now enjoying their reward in heaven. There are a great many excellent characters mentioned in the Bible, and some who are represented as perfect. "Enoch walked with God three hundred years, and he was not, for God took him." "Noah was a just man, and perfect in his generation." Job was "perfect and upright," and one that "feared God and eschewed evil." It is said of Abraham, that he "obeyed the voice of God, and kept his commandments, and his statutes, and his laws." Gen. xxvi. 5. And he obtained the dignified title of "the friend of God." James ii. 23. The character of Joseph appears to have been without blemish, and it is said, "The Lord was with him." The prophet Samuel was called in childhood to the service of God, and served him all his days.

It appears that there were good men in the days of king David, for he says, "Mark the perfect man, and behold the upright, for the end of that man is peace." There is reason to believe that Elijah was a perfect man, for he was translated; and Daniel, and some others of the prophets, appear to have lived in great favor with God. If such a state of perfection was attained by some before the Christian dispensation, may we not conclude that there have been a still greater number of such characters since?

There is not a single passage in the Scriptures, which says that the guilt of Adam is imputed to his offspring;—they do not even prove that there is any inherent depravity in man. The expressions of David, where he says, "I was shapen in iniquity, and in sin did my mother conceive me," (Ps. li. 5,) were uttered at a time when he was under deep conviction for actual transgression; but if they must be taken literally, they only prove that his mother was a sinner.

What is sin? Is it not "the transgression of the law?" and "where there is no law, there is no transgression." Jesus said of the Jews, "If I had not come and spoken unto them, they had not had sin; but now they have no cloak for their sin." John xv. 22. The spirit of Christ still makes known to every man his duty; and until we disobey him, we have no sin." It is true that

it is said, "By the disobedience of one man many have been made sinners;" but this expression may be applied to others besides Adam. It is said of Jeroboam, the son of Nebat, that he "made Israel to sin;" and that "the children of Israel walked in all the sins of Jeroboam which he did; they departed not from them." Wherefore it is said, that Josiah "made all that were present in Israel to serve the Lord their God; and all his days they departed not from following the Lord, the God of their fathers." Now, when we consider the relation in which Adam stood to the human family, it is not surprising that many of them should follow his early example; and that these again should influence others to swerve from the path of rectitude. Such a result is perfectly consistent with what we know of the character of man.

The Apostle Paul, after speaking of "the children of disobedience," Eph. ii. 3, says, "Among whom we also had our conversation in times past, in the lusts of our flesh, fulfilling the desires of the flesh and of the mind, and were by nature the children of wrath, even as others." But in another place, the same apostle says, "The gentiles which have not the law, do by nature the things contained in the law; these having not the law, are a law unto themselves; which show forth the works of the law written in their hearts." Rom. ii. 14.

Now, if the first of these texts proves that some men have been sinners "by nature," the second one proves that others have been righteous "by nature." I understand the apostle's doctrine to be, that when we "fulfil the desires of the flesh and of the mind," we come into the nature of the children of wrath, who are the children of disobedience; but when we show forth the works of the Divine law written in our hearts, we become "partakers of the Divine nature." "As by one man sin entered into the world, and death by sin, and so death passed upon all men, for that all have sinned." Here the reason is assigned why spiritual death hath passed upon all men; it is because all have sinned, and not because of any imputed guilt. And the same apostle has said, that "as in Adam all die, even so in Christ shall all be made alive." He does not say that we all died in Adam: but he speaks in the present tense, and says, "In Adam all die." Now let us consider what nature it is that we have derived from Adam. Is it not our animal nature? It cannot be our spiritual nature; for God only is "the Father of spirits." Heb. xii. 9. If, then, we are governed by this animal or earthly nature which we derive from Adam, we die; for "to be carnally-minded is death;" but if we become obedient to "the law of the spirit of life in Christ Jesus," we shall live; for to "be spiritually minded is life and peace." The name Adam, signifies earthy; and the apostle says, "The first man is of the

earth, earthy." The first developments which take place in the infancy of man, are his animal appetites; for "that is not first which is spiritual, but that which is natural, and afterwards that which is spiritual." These appetites are necessary to our animal existence, and they are not evil in themselves; but they become evil to us, when we suffer them to have dominion over us; for they are good servants, but bad masters.

(To be continued.)

From the Religious Magazine.

SECRET PRAYER.

I am more and more convinced that the prayer which most benefits the heart, and secures the blessings it needs, is the inward prayer of the soul, when the mind, without vocal utterance, lifts its thoughts on high, and the heart pours forth its yearnings, in silent communings with the Everlasting Father. This is a form and manner of prayer which can be exercised at all times and in all places, in the evening as we lay our heads down to rest, in the morning when we rise from our slumbers, in the intervals of labor through the day, in our contemplations of the outward world, the heavens and the earth, in our thoughts of a better world, of God and his infinite goodness towards us.

Such prayers can be offered without prayer-book or liturgy,—as well in the open air, under the rich canopy of heaven, in the fields and forests, by the wayside, or in the crowded city, as in the costliest sanctuary.

It is a remarkable fact, that our Saviour never recommended public prayer. The manner of praying practised by the Pharisees he decidedly condemned, as well for the motive that prompted it, as for the vain repetitions and the ostentatious publicity that characterized it. It is not to be inferred from this that public prayer, as an act of public worship, in the sanctuary, is condemned, but we may derive a lesson from it as to the manner and place of our individual and personal acts of devotion, that they should never be unnecessarily public. The Saviour advises that our prayers should be offered in secret. "When thou prayest, enter into thy closet, and when thou hast shut the door, pray to thy Father which is in secret, and thy Father which seeth in secret shall reward thee openly." By this we are to understand, not a particular room or closet in our dwellings, but the closet of our hearts, where in private meditation and prayer we may hold communion with our Father in heaven; and though we see him not with our natural eyes, and those who are around us are not aware of our inward emotions and heavenward desires, He will, if it is best for us, give us the desire of our hearts.

I have always been favorably impressed with the views and practice of the Friends, or Quakers

on this subject. A more benevolent, upright and Christian people there is not, probably, in this lower world. How pleasantly I have been affected, in sitting down with them at their meals, to join in the silent thanksgiving to the Creator, by a brief pause, before commencing the repast! I cannot but think this more sincere and heartfelt than the usual repetition of nearly the same words, commonly called "asking a blessing," or "grace before meat." Every heart seems to be engaged in the silent exercise, instead of *listening* to the words that are often said, but not always felt.

Nevertheless, there is a holy influence exerted upon the minds of a family by a daily reading of the Scriptures and a united offering of prayer; and the practice may be justly regarded as an act of private devotion, though not of secret prayer. The Psalms of David furnish many aids to such a service, and the reading of them in alternate verses, the parent leading, and the rest of the family responding, all joining in the Lord's prayer at the close, forms a most beautiful and profitable exercise. No liturgical service can be better adapted to cultivate the spirit of devotion in a family than this.

But such an exercise should not take the place of secret prayer, or become a substitute for it. Every child should be taught to commune, for himself or herself, with our Heavenly Father, by means of private devotion, at first in such simple forms and words as are adapted to the comprehension and wants of the infant mind, and afterwards by the use of the Lord's prayer, and by silent offerings of the heart, until they shall learn from their own experience the truth of Montgomery's beautiful definition of prayer, in that dear, familiar hymn,—

"Prayer is the soul's sincere desire,
Uttered or unexpressed," &c.

Among the most touching and simple of infant prayers that was ever composed, are the words so universally familiar in Christian homes,—

"Now I lay me down to sleep,
I pray the Lord my soul to keep;
If I should die before I wake,
I pray the Lord my soul to take."

This prayer is generally the first lesson of devotion the Christian mother gives her child,—

"the simplest form of speech
That infant lips can try."

And the fact is a significant and beautiful one, that it has continued to be the form of private prayer with many persons, not only through the years of childhood, but during the whole of life. John Quincy Adams, the great American statesman, declared, not long previous to the close of his earthly career, that for nearly eighty years he had never sunk to sleep upon his pillow without offering this prayer of his childhood,—a fact

as honorable to his Christian character as it was characteristic of the simplicity and childlike nature of his faith, and the strength of his trust in the Divine Providence.

The habit of secret or private devotion begets a proper feeling of dependence upon God, and a habit of communion with the Spirit of God. It is a source of strength in temptation, of comfort in affliction, and of spiritual advancement in the development and growth of the soul's best affections, emotions, and powers. Let every Christian, and every one who aspires to the Christian life, cultivate the practice of frequent prayer, as a regular habit of the mind and heart, remembering the promise of Him whose word has never failed: "And your Father who seeth in secret" (who knows your inward desires and purposes) "will reward you openly." Such a habit will prove a shield against the arrows of misfortune, a balm for the wounded spirit, and a renewing power in the soul, giving courage and fortitude in the midst of danger, hope in the hour of despondency, and peace in the storm of adversity. In the soul that thus holds a living communion with God, there is light when all without is darkness, there are calmness and resignation in the midst of peril and death.

Give me, then, the spirit of prayer, that I may, through its influence, have a closer walk with God, and feel that I am ever beneath his sheltering care. By daily prayer and effort, in the midst of life's trials and difficulties, may I lean upon God, and be led by his fatherly hand! When my earthly prospects grow dim, and human love and friendship wax cold—when sickness and sorrow oppress my soul, and the shadow of death seems to be over me—through the habit of secret prayer may I know that my Heavenly Father is ever near, and that his hand is outstretched to uphold and strengthen me! When I have strayed from the path of love and duty; when I have become involved in darkness, and am "in wandering mazes lost;" when my love of self and of the world is leading me away from thee, my Father—then, by whatever discipline may be needful to my soul, O bring me to thyself again, and keep me ever near to thee!

J. G. F.

Beauty is a short-lived flower, which is easily withered. A cultivated mind is a treasure which increases every moment; it is a rich soil, which brings forth an hundred fold.

From "The Leisure Hour."

PATERNAL DUTY.

The father who plunges into business so deeply, that he has no leisure for domestic duties and pleasures, and whose only intercourse with his children consists in a brief word of authority, or a surly lamentation over their intolerable expen-

Siveness, is equally to be pitied and to be blamed. What right has he to devote to other pursuits the time which God has allotted to his children? Nor is it an excuse to say that he cannot support his family in their present style of living, without this effort. I ask, by what right can his family demand to live in a manner which requires him to neglect his most solemn and important duties? Nor is it an excuse to say that he wishes to leave them a competence. Is he under any obligation to leave them that competence which he desires? Is it an advantage to be relieved from the necessity of labor? Besides, is money the only desirable bequest which a father can leave to his children? Surely, well-cultivated intellects; hearts sensible to domestic affection, the love of parents, of brethren and sisters; a taste for home pleasures; habits of order, regularity and industry; hatred of vice, and vicious men, and a lively sensibility to the excellence of virtue; are as valuable a legacy as an inheritance of property—simple property, purchased by the loss of every habit which would render that property a blessing.

INTERESTING LETTER WRITTEN IN 1653.

“Dear Friend,—I have long professed to serve and worship the true God, and as I thought, above many sects, attained to a high pitch in religion; but now, alas! I find my work will not abide the fire. My notions were swelling vanities, *without power or life*. What it was to love enemies, to bless them that curse, to render good for evil, to use the world as using it not, to lay down life for the brethren, *I never understood*; what purity and perfection meant, I never tasted. All my religion was, *but the hearing of the ear, the believing and talking of a God and Christ* in heaven, or a place at a distance, I knew not where. Oh! how gracious was the Lord to me in carrying me to Judge Fell’s, to see the wonders of his power and wisdom—a *family walking in the fear of the Lord, conversing daily with Him, crucified to the world, and living only to God*. I was so confounded, all my knowledge and wisdom became folly; my mouth was stopped, my conscience convinced, and the secrets of my heart were made manifest, and that Lord was discovered to be near, whom I ignorantly worshipped. I could have talked of Christ in the saints, the hope of glory, but it was a riddle to me. And truly, dear friend, I must tell thee I have now lost all my religion, and am in such distress, I have no hope nor foundation left. My justification and assurance have forsaken me, and I am even like a poor shattered vessel, tossed to and fro, without a pilot or rudder; as blind, dead, and helpless, as thou canst imagine. I never felt corruption so strong, and temptation so prevailing, as now; *I have a proud, hard, stinty heart*, that cannot be sensible of my misery.

When I deeply consider *how much precious time I have wasted, and how unprofitably I have lived*, my spirit feels a sudden fear; but I am still flying to my old refuge, and there my thoughts are diverted. What it means to wait upon God, I cannot apprehend; and the confusions in my own spirit, together with the continual temptations from without, are so great, I cannot understand or perceive the small still voice of the Lord.

“What thou told me of George Fox, I found true: when thou seest him or J. Naylor—they both know my condition better than myself,—move them, if neither of them be drawn this way, to help me with their counsel by letter. They are full of *pity and compassion*, and though I was their enemy, they are my friends, and so is Francis Howgil, from whom I received a letter full of tenderness and wholesome advice. Oh! how welcome would the faces of any of them be to me; truly I think I could scorn the world to have fellowship with them. But I find my heart is full of deceit, and I exceedingly fear to be beguiled, as I have been, and to be reduced into a form without power, into a profession before I possess the Truth; which will multiply my misery, and deprive me both of God and the world. It will much refresh me to receive any lines from thee; but be thou faithful. Thou mayest perceive by my Ashdod language, what countryman I am—even of the low world that lives in darkness. I have been at Judge Fell’s, and have been informed from that precious soul, his consort, in some measure what these things mean, which before I counted the overflowings of giddy brains. Dear heart, pity and pray for me; and let all obligations of former friendship be discharged, in well wishes to the soul of thy old family friend, that he may partake with them of your heavenly possessions. A. P.”

Extract from the Epistle of the Meeting for Sufferings in London, dated the sixth day of the Seventh month, 1751.

To the Quarterly and Monthly Meetings of Friends in Great Britain, Ireland and America:
Lancashire Quarterly Meeting, in Great Britain,
14th of 7th Month, 1790.

This Meeting, on considering the deviations of divers among us from our ancient and Christian Testimony against calling the days and months by their usual names, is concerned to remind such Friends, particularly those who are young in years, of the ground upon which our testimony stands, by reviving the following information and advice, issued by order of the Yearly Meeting in London, held in 1751.

Dear Friends,—We think it may be useful and expedient to revive in your remembrance some of the motives which induced our ancient Friends to forbear the vulgar appellations of the

months and days, and to observe in their conversations and writings such names as were agreeable to Scripture, and the practice of good men therein recorded.

The Children of Israel, the people whom God chose out of all the families of the earth to place his name among, and to make himself known unto, were strictly commanded not only to abstain from the idolatrous practices of the nations, in the midst of whom they dwelt, but were enjoined to be circumspect in all things that the Lord commanded, and even to make no mention of the names of other gods, neither to let it be heard out of their mouth, *Exod. xxiii. 13.* This injunction was not relative to any legal or typical rites, external ceremonies, or institutions of the law peculiar to the Jewish nation, but was a perpetual command and standing ordinance, respecting the honor of the One Almighty Being, the same yesterday, to-day, and forever, and as such ought to be regarded by us, and by all the generations of those who with the heart believe, as well as with the tongue confess, that the Lord He is God, and that there is none else beside Him, *Deut. iv. 35,* who hath declared, I am the Lord, that is my name, and my glory will I not give to another, neither my praise to graven images, *Isaiah xlii. 8.*

Convinced of this great and everlasting truth, both by the testimony of the holy Scripture, and the manifestation of that Divine principle, which leads those who are faithful to its teachings, from all that would dishonor the name of God, either in word or deed, our ancient Friends were conscientiously concerned to refrain from the use of those names of months and days which had been ascribed by way of honor to the idols of the heathen, and in conformity to their false worships: This concern rested upon them from a firm persuasion, that the glorious Gospel Day and Time was come, wherein the Lord was fulfilling his Covenant with Israel, viz: I will take away the names of Baalim* out of his mouth, and they shall no more be remembered by their name. *Hosea ii. 17.*

And that you may the more clearly discern the importance of that Christian testimony, borne by our predecessors in this case, we recommend what follows to your serious consideration, viz:

A Brief Account of the Origin of the Names of some Months of the Year, and of all the days of the week, now eustomarily and commonly used.

1. January was so called from Janus, an ancient king of Italy, whom heathenish superstition had deified, to whom a temple was built, and this month dedicated.

2. February was so called from Februa, a word denoting purgation by sacrifices; it being usual in this month for the Priests of the heathen god Pan to offer sacrifices and perform certain rites, conducing, as was supposed, to the cleansing or purgation of the people.

3. March was so denominated from Mars, feigned to be the god of war, whom Romulus, founder of the Roman empire, pretended to be his father.

4. April is generally supposed to derive its name from the Greek appellation of Venus, an imaginary goddess worshipped by the Romans.

5. May is said to have been so called from Maia, the mother of Mercury, another of their pretended Ethnick deities, to whom in this month they paid their devotions.

6. June is said to take its name from Juno, one of the supposed goddesses of the heathen.

7. July, so called from Julius Cæsar, one of the Roman emperors, who gave his own name to this month, which before was called Quintilis, or the Fifth.

8. August, so named in honor of Augustus Cæsar, another of the Roman emperors. This month was before called Sextillis, or the Sixth.

The other four months, namely, September, October, November, December, still retain their numerical Latin names, which, according to the late regulation of the calendar, will, for the future, be improperly applied. However, from the continued use of them hitherto, as well as from the practice of the Jews before the Babylonish captivity,† it seemed highly probable, that the method of distinguishing the months by their numerical order only, was the most ancient, as it is the most plain, simple and rational.

As the idolatrous Romans thus gave names to several of the months in honor of their pretended deities: so the like idolatry prevailing among our Saxon ancestors, induced them to call the days of the week by the name of the idol which on that day they peculiarly worshipped. Hence

The First day of the week was by them called Sunday, from their accustomed adoration of the Sun upon that day.

The Second day of the week they called Monday, from their usual custom of worshipping the Moon on that day.

The Third day of the week they named Tuesday, in honor of one of their idols called Tuisco.

The Fourth day of the week was called Wednesday, from the appellation of Woden, another of their idols.

The Fifth day of the week was called Thursday, from the name of an idol called Thor, to whom they paid their devotions upon that day.

The Sixth day of the week was termed Fri-

*The word Baalim, being the plural number of Baal, signifying Lord, has relation to the names of divers idols of the heathen, worshipped in several places.

† See the Scriptures to the time of Ezra.

day, from the name of Friga, an imaginary goddess by them worshipped.

The Seventh day they styled Saturday, as is supposed from Saturn, or Seater, by them then worshipped.

The continued use of these names of days, derived from such gross idolatry of the heathen, is a demonstration how little the purity of the Christian religion was understood by the generality of those who came into the public profession of it.

The following ages of Popish superstition, not only indulged their proselytes in the use of such heathenish names and customs, but also invented and introduced other unsound and unscriptural practices in religion. For when the profession of the Christian religion became national, multitudes of the heathen priests, whose interest lay in the performance of rites, ceremonies and sacrifices, embraced prevailing Christianity with selfish views, and labored early, with too much success, to find employment for themselves, by imposing on the people a new set of ceremonies and sacrifices, bearing some resemblance to those which in their former state of heathenism they had been accustomed to. From this corrupt source sprang the Popish sacrifice of the Mass, the celebration of which, at particular times, and on particular occasions, gave rise to the vulgar names of Michaelmas, Martinmas, Christmas, and the like.

Seeing, therefore, that these appellations and names of days, months and times are of an idolatrous or superstitious original, contrary to the Divine command, the practice of good and holy men in former ages, and repugnant to the Christian testimony borne by our faithful Friends and predecessors in the Truth, for the sake of which they patiently endured many revilings; let neither the reproach of singularity, nor the specious reasonings of such as would evade the cross of Christ, turn you aside from the simplicity of the Gospel, nor discourage you from keeping to the language of truth, in denominating the months and days according to the plain and scriptural way of expression, and so shall we follow the example of our worthy elders, and come up in a noble and honorable testimony against these, and all other remains of idolatry and superstition.

Re-published by directions of a Meeting for Sufferings, held in Philadelphia, the 15th of 12th month, 1791, and recommended to the observation of the members of our religious society in general.

True greatness of soul pays itself, as it were, with its own hands, by the satisfaction of doing good.

He that overcomes his passions, conquers his greatest enemies.

History of the Religious Society of Friends, from its rise to the year 1828. By SAMUEL M. JANNEY.

PROSPECTUS.

It is proposed to publish the first volume of this work as soon as a sufficient number of subscribers is obtained to justify the undertaking. The whole work can probably be comprised in four volumes, duodecimo, of about 450 to 500 pages each; and the author intends to complete it, publishing one volume at a time, as fast as materials can be collected and digested.

It will embrace a more full relation than has been given by other historians, of the early experience and remarkable incidents in the lives of the most prominent members, as well as a narrative of the rise and progress of the Society, and an account of its sufferings, schisms, doctrines, and testimonies. The author's object is to produce an impartial and instructive work, and he hopes to render it interesting to the young, as well as to those of mature years.

It will be well printed on good paper, similar in style to Janney's Life of Penn. To subscribers the price of this volume will be, in cloth, \$1 15 cents, or in sheep, library style, \$1 25 cents, payable on delivery. Those subscribers who may not wish to take the remainder of the work will be expected to notify the agents or publishers within six months after receiving the first volume.

Agents will be allowed one copy for every six subscribers obtained, and they are requested to return the subscription papers by or before the last of the Eighth month to S. M. Janney, Purcellville, Loudoun County, Virginia; or to Hays & Zell, 439 Market Street, Philadelphia.

CONTENTS OF VOLUME I.

Introduction. Characteristics of Primitive Christianity—Appearance and Progress of the Apostacy—Effect of the Protestant Reformation.

Chapter I. Rise of the Society of Friends in the Midland Counties of England, including the Early Experience and Labors of George Fox.

Chapter II. Convincement in the North of England—Religious Experience of Richard Farnsworth, William Dewsbury, and James Naylor.

Chapter III. Vindication of Friends for Preaching in "Steeple-Houses"—Convincement in the Dales of Yorkshire—Early Experience of Francis Howgill, John Camm, John and Ann Audland, Richard Hubberthorn, and Edward Burrough.

Chapter IV. Changes in the English Government—Desolation and Distress—Views of the Early Friends on the Fulfilment of Prophecy—Convincement at Swarthmore of Margaret Fell and Family—Religious Experience of William Caton, Thomas Taylor, and Christopher Taylor.

Chapter V. Convincement in Cumberland,

Westmoreland, Norfolk, Suffolk, and Essex—Meetings at Pardshaw Crag—Account of John Burnyeat, James Parnell, John Stubbs, George Whitehead and George Fox, the younger.

Chapter VI. Rise of the Society in London—Services of Francis Howgill, Edward Burrough, J. Audland, J. Camm, and Anthony Pierson—Letters of E. B. and F. H. to Margaret Fell—List of Friends' Meetings in London—Religious Experience of William Bayly and William Crouch.

Chapter VII. Rise of Friends in Bristol, Kent, and Bedfordshire—Account of Charles Marshall, Josiah Cole, George Bishop, and Barbara Blaugdon—Persecution at Bristol—Account of Luke Howard, Samuel Fisher, Alexander Parker, John Crook, and John Lilburn.

Chapter VIII. Number of Ministers in the Society—Labors in Yorkshire and Cornwall—Persecutions and Trials of Friends.

Chapter IX. Friends' Meetings in Essex, Bedfordshire, and London—Account of Stephen Crisp, J. Parnell's sufferings and death—James Naylor's delusion, trial, sufferings, restoration, and death.

Chapter X. Rise of Friends in Wales—Letter of Thomas Holmes—Travels of George Fox and John Ap-John—Account of Richard Davies.

Chapter XI. Rise of Friends in Scotland—Account of W. Osborne, Richard Rae, and Alexander Hamilton—Visit of George Fox and R. Widders to Scotland.

Chapter XII. Rise of Friends in Ireland—Account of William Edmundson—His Persecutions and Labors—Religious Labors of E. Burrough, F. Howgill, Miles Halhead, J. Lancaster, Elizabeth Fletcher, Elizabeth Heavens, Barbara Blaugdon, and Thomas Loe.

Chapter XIII. Rise of Friends in New England and New York—Visit of Mary Fisher and Anna Austin; their Imprisonment and Expulsion—Arrival of eight other Friends from London; they are sent back in the same ship—Labors and Sufferings of William Brend, Christopher Holder, John Copeland, Sarah Gibbons, Mary Weatherhead, Dorothy Waugh, Robert Hodgson, Humphrey Norton, Richard Doudney, William Robinson, and Mary Clark, in New England and New York.

Chapter XIV. Religious Labors of Friends in Massachusetts, Plymouth, New Haven, and Rhode Island—Sufferings of Friends in Massachusetts—William Brend cruelly beaten—C. Holden and J. Copeland have their ears cut off—Travels of Josiah Cole and T. Thurston among the Indians—Sufferings of Lawrence and Cassandra Southwick; their Banishment and Death—Attempt to sell Daniel and Provided Southwick into Slavery—The Captains refuse to take them—Patience Scott, at eleven years old, Imprisoned—Her remarkable Character—William Robinson, Marmaduke Stephenson, and Mary

Dyer Sentenced to Death—Reprieve of Mary Dyer and Execution of the others—Discontent of the People of Boston with their Rulers.

Chapter XV. The Court in Boston Attempts to Vindicate its Proceedings—Return of Mary Dyer—Her Trial and Execution—William Leddra's Trial and Execution—Sufferings of E. Wharton, J. Chamberlain, Wenlock Christison, and others—Progress of Friends' Principles in New England.

Chapter XVI. Rise of the Society in Maryland, Virginia, and the West Indies—Religious Labors of Elizabeth Harris, Josiah Cole, T. Thurston, and Others in Virginia and Marland—T. Thurston Imprisoned in Maryland, and other Friends fined—Visit of Mary Fisher to the West Indies, and of John Rouse and Peter Head to Nevis.

Chapter XVII. Travels of Friends in France, Holland, Germany, Italy, and Turkey—W. Caton and John Stubbs go to Holland; George Baily to France; William Ames to Holland and Germany; E. Burrough and S. Fisher to Dunkirk; J. Stubbs and S. Fisher to Rome—George Robinson's Journey to Jerusalem, and Mary Fisher's to the Sultan of Turkey.

Chapter XVIII. Progress of Friends' Principles up to 1660—Their Sufferings—Their Appeals to Cromwell and to the Parliament—Peace Principles of George Fox—Views of George Fox the younger—F. Howgill, Ed. Burrough, and J. Pennington on Defensive War and the Use of the Sword by the Civil Magistrate—F. Howgill's Argument against Tithes—Funds raised to aid Ministers Travelling in Foreign Lands—Conduct of Friends in regard to Holy-days and Sabbath-days—Charges of Fanaticism Examined—Meetings for Discipline Instituted—Characteristics of Early Friends.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SIXTH MONTH 11, 1859.

We would call the attention of Friends, who design placing their children in Friends' Central School for the ensuing year, to the fact that there are but few vacancies, and we deem it important that they make early application.

—
"History of the Religious Society of Friends, from its rise, to the year 1828, by SAMUEL M. JANNEY."

We refer our readers to the Prospectus and table of contents of the first volume of this work, which we have the satisfaction of announcing as nearly ready for publication. In this day of re-

ligious inquiry, little need be said to urge the value of a work of this description, written in an attractive style, and so arranged as to present the principal events in the history of the Society, and biographical sketches of the remarkable men and women who have labored and suffered in different periods of its history, for the cause of civil and religious liberty.

The labors of the historians, Gough and Sewell, do not extend beyond the last century, and many interesting circumstances, not contained in their works, have been collected, particularly in regard to the Society in this country.

We have had an opportunity of examining some of the chapters of the forthcoming volume, which appear to us highly interesting; and even in the recital of well known incidents, there is a freshness which seems to place them in a new light. The opportunities which the writer has enjoyed for historical research, and his character as a historian, justify the expectation that he will perform the task in a manner that will prove acceptable. The Prospectus will be circulated throughout the various Yearly Meetings on this continent, and Friends will thus have an opportunity of becoming subscribers. It is suggested that those who are remotely situated, and are not presented with a Prospectus, should forward their names by letter to the publishers. As soon as a sufficient number of subscribers are obtained, the work will be issued from the press.

MARRIED, At East Hamburg, on the 31st of 5th month, with the approbation of Friends, AARON HAMP-
TON, to PHEBE, daughter of Charles Meatyard.

DIED, On the 5th of 5th month, 1859, in Indiana-
polis, Indiana, of consumption, after an illness of five
months, which was borne with Christian fortitude,
JAMES F. PLEASANTS, in the 25th year of his age.

Although married but ten months, he yielded up all
the bright prospects of a life of happiness here, for
that blessed abode on high, with cheerful resignation,
often remarking to his friends, why was the summons
of his Heavenly Father so long delayed. At his re-
quest, his remains were interred in Friends' burying
ground at Richmond, Indiana.

—, At Richmond, Indiana, on the 31st of 5th mo.,
CHARLES S., infant son of J. S. and Rebecca D. Wil-
son, aged 9 months and 5 days.

—, At East Hamburg, on the 23d of 5th month,
after a short illness, WILLIAM HAMPTON, in the 83rd
year of his age, a member of E. H. Monthly Meeting,
and formerly a resident of New Jersey.

—, In Wrightstown, Bucks county, Pa., on the
29th of 5th month, SUSAN WARNER, in the 84th year of
her age, a member of Wrightstown Monthly Meeting.

CHARLES LAMB.

Charles Lamb was born in Crown Office Row, Inner Temple, London, on the 18th of February, 1775. His father, John Lamb, had left Lincoln when a boy, and had come to London with as bright dreams and scarcely brighter prospects than worshipful Dick Whittington. He had entered the service of Mr. Salt, one of the benchers of the Inner Temple, as footboy, and eventually so outgrew his livery and original position, that in his maturer years he expanded, in the words of Elia, into Mr. Salt's "clerk, his good-servant, his dresser, his friend, his 'flapper,' his guide, stop-watch, his auditor, treasurer." He had married and settled in the obscure domain of his duties, laboring with patient assiduity to win his bread, and that of those who fed his heart with affection in requital of his toils. A son and daughter blessed the union of John Lamb and his wife. Nature seemed at first satisfied with the reproduction to each of one infantile object of peculiar affection, for the boy had become twelve years old and the girl ten, before Charles was born to revivify and concentrate in himself the love of all his father's amiable household. For seven years Charles Lamb resided in the seclusion of his home in the Temple; and then, through the patronage of Thomas Yeates, governor, he was admitted to the school of Christ's Hospital, whose cloisters, with yellow stockings and flowing blue gown, he trod until he was fifteen. Nature had denied the lad a masculine frame, as well as that selfish, domineering spirit which compensates to small boys for the lack of physical strength, and makes them commanders and governors of boys, as they often have become of men; but the gentleness of manners and generosity of heart which characterized the Charles Lamb of riper years, and made all who knew him love him, won from even the self-
ish young monks of Christ's Hospital the homage of universal affection and gentle consideration. The most robust and virile were conquered by his sweet timidity; the stern and bold respected his corporeal infirmity. Thrown into himself, by a defect in his speech, and constitutionally averse to those rougher pastimes, for which his physical debility incapacitated him, Charles Lamb indulged in antique fantasies, which were alike the result of all his associations and education, until his keenly observing and amiable mind became like some old Gothic fane, quaint yet beautiful in its construction; elaborate yet fantastic in its rich and varied ornaments; with capacities for religious gloom deep as sacristy or shady aisle, and for a joyous light, sweet and softened as that which falls upon a marble tomb, through the medium of a stained oriel, upon a lovely midsummer's noon.

Lamb's lingual impediment, which nervous agitation increased, claimed the indulgence of his teachers; and his sweetness of disposition, joined

to an acute and powerful intellect, won their sympathy and respect. No harsh inhumanities, dealt out in the name of curatives, intermitted his thoughtful habits of boyhood, or added to the natural tristesse of his mind. The classics were his favorite schoolday studies; and the old English classics were the mental aliment of the man. His home, in whose sombre shades were embosomed the deep springs of parental and the greenness of fraternal love, was full of old associations; the hospital and school, in which he passed his most impressible years, were buttressed and roofed with ideas and memories of the past, and lent a bias to the boy's mind. Lamb's abilities and classical attainments marked him out at school for distinction; but the invincible stammer in his speech consigned him to sedentary drudgery and ignoble obscurity. While less able cotemporaries marched from behind him to the University, with their eyes illuminated with hopeful ambition, he modestly and unobtrusively retired to occupy the humble tripod of a scrivener in the South Sea House, where he passed a three months' apprenticeship, under the cognizance of his brother John, preparatory to his appointment to the accountant's office of the East India Company, which he obtained on the 5th of April, 1792.

Lamb's youth was passed in tenderly watching the declining years of his parents, and in glean- ing rare thoughts with his sister, from the rich harvest of good old English authors, which constituted the library of his father's employer, Mr. Salt; and the even tenor of his life was sometimes interrupted and enlivened by a dinner with some of his old schoolmates, when the Cambridge vacations allowed of their return to London. These re-unions must have vividly recalled the memory of Charles Lamb's blighted prospects, but they never produced one visible sentiment of regret; he had early learned to dissociate himself from all individual sense, save as a dreamer or a lover. The worldly, present or prospective, as related to himself, had no power to disturb his equanimity. His world of griefs and shadows was of the past; of the present he had none save the most kindly and generous thoughts.

Occasional association with the companions of his youth broke the dull current of the poor clerk's monotonous life, but it could not satisfy the yearnings of his soul; he must have something to admire, some luminary superior to his own light to shed a halo of love and sympathy around the years of his exile, from that sphere in which he felt, if he was not able to act, in which he deserved to be if he was not. His consciousness of intellectual power, humble and modest as that consciousness was, and the construction of his sympathetic mind, must have been fruitful sources of regret to him, as he contemplated those mechanical labors to which high intellectual sym-

pathy was alone calculated to make him feel resigned. In Coleridge and friendship he found enough to satisfy him for his estrangement from Alma Mater, and for the extinction of his academical ambition. The "inspired charity boy" had been the object of his admiration at school, and he became the enthroned tenant of his adoration and love, when both began to tread the path of laborious life. The splendid genius, and glowing, generous enthusiasm of Coleridge touched with electric vigor the latent powers of Lamb. The higher qualities of Coleridge's genius elevated and developed those of his timid friend, until they felt their own original strength and walked alone; and the friendship of Coleridge, whom he early recognized as one of the most splendid geniuses of his day, satisfied the aspiration of Lamb for intellectual distinction. It is to Coleridge's friendship with Lamb that the world of letters is indebted for one of its most distinguished ornaments. The great erratic genius, so full of vague thoughts and grand suggestions, has the honor of suggesting and producing one great and complete work at least, and that was Charles Lamb.

The incidents of Lamb's life, save one—one terrible and trying as ever man with generous soul endured—were nothing more than a succession of friendships with the most distinguished literary men of this century; the epochs of his publications; and those other common occurrences which constitute the casualties of everyday life. He toiled at his desk in the India House; read poetry with his sister; wrote letters to his friends; changed his lodgings from the Temple to the city, and from the city to the Temple; kept house at Islington; paid occasional visits to his friends in the country, and stut-tered puns at the tables of his friends in the city; published poetry in concert with Coleridge and Lloyd; wrote quips and cranks for the daily and weekly papers, with essays for the monthlies; and consoled unsuccessful authors, who were not blessed with his magnanimous philosophy; retired from the India House, after upwards of thirty years' service, with a pension or £450 per annum; died at the age of sixty, and was buried in Ed- monton Churchyard. Such would constitute a complete synopsis of the grand elements of Charles Lamb's life, if that life had been apparent and superficial; but the annalist must search deeper and examine more closely for the lineaments and attributes of his exalted and heroic mind and character. The genius of Lamb was as fantastic as it was grave; it was as full of ornate beauties as of strange devices. He had nursed it in crypt and cloister, and had fed it on Beaumont and Fletcher, Massinger and Shakspeare, until it took the form of the originals, and invested modern incidents with the drapery of an antique fancy. Lamb's knowledge of, and association with modern authors were real, vivid, and pre-

sent; his own literary associations were old and ideal. His essays are full of the conceits of antiquity; they are rich, profuse, elaborate, and beautiful in style, though somewhat deficient in congruity. They are as highly polished as his wit, and sometimes as profound. There is no contradiction in speaking of the profundity of Lamb's wit. It was bright and apparent to those who were of similar habits of thought with himself, and who were familiar with his illusions.

The form of Lamb's writings is old, because his ideas had all been moulded in antique forms; they are prim, formal, and grand in appearance, and can be individualized, as of an old date, as distinctly as the South Sea House, or the trim benches of the Inner Temple. But the charm which vivifies and universalizes them is their plenitude and genuineness of generous affection. The warm emotions of the child live in the memory of the man, animating his quaint allusions and redundant comparisons, with the freshness and vigor of his own green, sunny heart. He revives in the affections of his auditors a love and reverence for the obsolete glories of England's Augustine age of literature, as a visit to Westminster Abby restores in the capable mind the supremacy and beauty of Gothic architecture, over the more pretending but abnormal styles of modern masonry. You are not accustomed to Lamb's manner, in these unrecondite times, and, perhaps, you may never learn to love it; but the originality which truly constitutes style—the earnest, active, motive, thought, living and loving on the vital page—is sure to find its way to the sympathetic heart, and win in every reader a lover for "Elia." Sometimes there is a recklessness, and abandonment of glee and humor, in the pages of Lamb, which grave people might condemn and wise ones would have repressed; but let it be remembered that it was only on paper that Lamb could give full point and expression to the vivid and varied ideas that would move him. His jokes and puns died ere they fell from his incapable tongue, and he was too guileless, too good, to conceal his humors. He was as free to reveal the erratic courses of his imagination as its more circumspect volitions. He threw from him the lighter bubbles of the human mind, as well as the deeper essence of its stream. He was human and did not see that the gravity of the philosopher was one iota more becoming the human countenance than the smile of the comedian. Both, he contended were comprehended in the limits of virtue, and only differed in kind. Laughter was not denied to the human face divine, and might be nearer to wisdom than many of wisdom's pretended votaries supposed. He wrote as he felt, and, like all men, he felt differently moved at different times.

One of the favorite and common adjectives to the name of Charles Lamb is *gentle*. Coleridge calls him his gentle Charles, and everybody else

has followed his example. Lamb rejected the application, and with reason. In one of his letters to the author of the "Rhyme," he says concerning this subject: "Don't make me ridiculous any more by terming me gentle-hearted in print. The meaning of gentle is equivocal at best, and almost always means poor-spirited; the very quality of gentleness is abhorrent to such vile trumpeting." Lamb's gentleness was of a lofty and spiritual kind, more akin to religion than poorness of spirit. He had been softened in the crucible of trial—intense, agonizing, and constant trial: and he had learned from childhood to regard the feelings of others as superior to his own. He was gentle towards men, and considerate even of their faults and frailties, not because he was afraid to rebuke them if need were, but because he knew and felt that he was frail himself. His gentleness was an honest, generous sacrifice of egotism and pride, which impelled him rather to suffer obloquy and unjust judgment than prove false to his sympathies and affections. No one more keenly felt the stings of injustice and the cuts of critical malice than he; but his was a heroism that would have rather endured the combined artillery of a dozen hostile reviews than have caused one friend a moment's pain. The political prepossessions of Lamb were not strong, their bias, however, was partly towards the grandeur of the past, and still more towards benevolence in the present. In his idealism, perhaps, he was a Tory. In his sympathies he was to all intents and purposes a "friend of the people." Political opinions, or any opinions, had no influence in recommending a man to the consideration of Elia. Of all things that existed beyond the cognizance of tyranny, and the power of external domination, opinion in his mind was the most sacred and inviolable. Conformity was no evidence of men's uniformity of thought; dissent, however extreme, implied independence; so that Coleridge, Hazlitt, Wordsworth, Southey, Bernard Barton (the Quaker poet), and Godwin, were each and all dear friends of Lamb, not because of coincidence of opinion, but because of that generous, genial humanity which was common to them all, and which distinction of party could not destroy. No considerations of party or opinion could have arrayed Elia against any one of these in hostility of feeling; but his spirited letter to Southey, in the *London Magazine* for October, 1823, showed with what chivalrous self sacrifice he could do violence to his own feelings, in defence of his friends, Hunt and Hazlitt, from the side thrusts of a Quarterly reviewer. Lamb's letter to Southey is the only ripple that disturbs the smooth tenor of his lifelong friendships; for even the perverse and passionate Hazlitt could not for a moment chill him or divert from himself the current of his warm affections.

(To be continued.)

TO NIGHT.

Coleridge pronounced this sonnet the best one in the English language; and what is quite remarkable, is the fact that the author did not know the language until after he was thirty years of age.

Mysterious night! when our first parent knew
Thee from report divine, and heard thy name,
Did he not tremble for this lovely frame,
This glorious canopy of light and blue?
Yet 'neath a curtain of translucent dew,
Bathed in the rays of the great setting flame,
Hesperus with the host of heaven came,
And, lo! creation widened in man's view.
Who could have tho't such darkness lay concealed
Within thy beams, O sun? or who could find,
Whilst fly, and leaf, and insect stood revealed,
That to such countless orbs thou mad'st us blind?
Why do we, then, shun death with anxious strife?
If light can thus deceive, wherefore not life?

J. BLANCO WHITE.

HOUSEHOLD TREASURES.

BY MARY HOWITT.

What are they—gold and silver,
Or what such ore can buy?
The pride of silken luxury—
Rich robes of Tyrian dye?
Guests that come thronging in
With lordly pomp and state?
Or thankless liveried serving men
To stand about the gate?

Or are they daintiest meats
Sent up on silver fine?
Or golden-chased cups o'er-trimmed
With rich Falernian wine?
Or parchments setting forth
Broad lands our fathers held?
Parks for our deer—ponds for our fish—
And woods that may be felled?

No, no, they are not these, or else
God help the poor man's need!
Then, sitting 'mid his little ones,
He would be poor indeed!
They are not these! our household wealth
Belongs not to degree;
It is the love within our souls—
The children at our knee!

My heart is filled with gladness
When I behold how fair,
How bright are rich men's children,
With their thick golden hair!
For I know, 'mid countless treasure,
Gleaned from the east and west,
These living, loving, human things
Are still the rich man's best!

But my heart o'erfloweth to mine eyes,
And a prayer is on my tongue,
When I see the poor man's children—
The toiling, though they're young—
Gathering with sun-burnt hands,
The dusty way-side flowers,
Alas! that pastime symboleth
Life's after, darker hours.

My heart o'erfloweth to mine eyes,
When I see the poor man stand,
After his daily work is done,
With children by the hand;

And this he kisseth tenderly,
And that sweet names doth call—
For I know he hath no treasure
Like those dear children small.

Oh, children young, I bless ye,
Ye keep such love alive!
And the home can ne'er be desolate
When love hag room to thrive!
Oh, precious household treasures!
Life's sweetest, holiest claim—
The Saviour blessed ye while on earth—
I bless ye in his name!

(Letter from Frances D. Gage.)

RESULTS OF EMANCIPATION IN SANTA CRUZ.

Santa Cruz, W. I., March 30, 1859.

To the Editor of The National Anti-Slavery Standard.

I have been spending nearly two weeks upon this pleasant Island, among its village people, and have made several sallies out among its sugar estates, finding much in my wandering that I think would interest the readers of The Standard. I need not tell them of the waving palms, of luxuriant cocoas, of orange groves, or magnificent cane fields, nor of the prospect of the sugar and rum crop. To them there is a higher point of interest than the agricultural productions of the Island, or the beauties which nature has spread over its picturesque mountains and vallies: the great problem of human freedom that is being worked out here by the twenty thousand of those unfortunate children of oppression, who twelve years ago wore the chains of a master!

It is asserted boldly in the United States, and especially in the West and South, that the emancipated slaves of the West Indies are in a far worse condition now than they were before their release from bondage. Even here this charge is made by nearly every American or Dane that you meet at the hotels or boarding-houses, or on the estates. So constantly did I hear it that I became all the more anxious to see and hear and know for myself the facts.

I had just come from the slave region of the South and from Cuba. I had been on estates, in Missouri, where "*slavery exists in its mildest form,*" (a favorite expression of our people), and of course began to compare notes.

On the sugar plantations bordering on the Mississippi, I saw hordes of slaves in the fields at work, always with an overseer behind them, whip in hand. Their clothing was scant—usually but one garment—a kind of chemise or frock for the women, reaching a little below their knees, no covering on the head; the men with pants and shirt (often without a shirt), and these of the coarsest material. We saw them working thus at sunrise, at noon, and at evening, and always working steadily and as if afraid to pause, though their motions were not so quick as the Yankee's, who has his eye ever fixed "on the main chance."

Their cabin homes on the banks of the great river look comfortable to the passer-by, and each family, it is said, is allowed a house, and each house is surrounded by a little land. They do not huddle together so as to exclude the air. Often these houses front a green lawn or lane, and look pleasant and quiet. What the inside may be we only know by hearsay, but have been told of dirt floors, a blanket, a kettle for boiling mush—little else.

We crossed the Gulf to Havana, went into the country, visited a coffee plantation, and saw the slaves at work by the wayside as we passed along. Everything we saw seemed to tell us of slaves in a worse condition than in the States. They seemed driven to their toil like many broken-down cattle, limping and hobbling along with listless, slow uneasy motions, half-clothed, dirty, and toil worn, and with no expression of countenance that told of hope. Gangs of men and women—the women with something to cover nakedness—the men, most of them, with only a strip of coarse cloth around the waist. At night they have not even the cabin home to go to, in which to be locked, with all light and air excluded by bolts and bars, save that which steals humanely in through cracks and crevices: but are huddled together into long dark pens, thatched overhead heavily with palm leaves, mouldering and decaying full of damps and vermin. Here they are locked up like sheep or cattle, to swelter out the few short hours of the night allotted to sleep.

Such is the outward view of the condition of the field hands in Cuba. House servants, of course, fare better. Now, let us look at the emancipated field hands of Santa Cruz, "*those poor, lazy, half-starved, half-naked, degraded creatures, that are far worse off than slaves of Cuba or South Carolina,*" of whom we have so often heard. The first object of interest as I rode out one morning was the children going to school. We were going from Christiansted, on the east end of the Island, to Fredericksted, on the west, fifteen miles, (the whole length of the island is twenty-five miles) through the most prosperous and rich portion of the Island. It was near eight in the morning. We passed group after group of colored children with their little baskets or pails of dinner, going to school. Each group had a colored woman with them, whose duty it was to see them to the school-house in good season and in good order, to take care of their dinners, and to bring them safely home again when school was closed at noon. These children were as well-dressed, as neat and clean as the same number of country children in our Western States; many of them too much dressed for a school. As we passed them, not one failed to lift the hand, and wish us good morning, and with a bright, pleasant smile, as if in their hearts they were happy.

The school-house was a large, airy building, set upon high ground, well ventilated, with the usual lattice work to let in the air and shut out the sun—capable, I should think, of accommodating two hundred children. Such a school-house would be an honor to many a country place, even in New England. The yards were very clean and neat, and the out-buildings comfortable. Shade trees were near.

The children seemed to come from two or three miles on each side. At nine we ceased to meet or pass these groups of children. We passed three of these school houses—saw them well-filled and the children quietly studying their books or standing in rows reciting their lessons, while their nurses sat under the shades, watching their dinners, sewing or chatting, with evident enjoyment.

These schools are established by the Danish government, and all under the charge of the Moravians. *There are nine of them on the Island.* These were children of the field-hands. Mark that as one evidence of degradation!

Then we turned to the field laborers. We saw them ploughing, hoeing, planting, weeding and gathering. We saw no whips, no driving, no nakedness, no gloom. The woman wore colored dresses, of calico or cotton goods, striped, blue and white. Every one had her head protected either by a fancy colored handkerchief, in shape of a turban, or a hat of straw or palm leaf. The dresses were long, reaching, when unconfined, to the feet; but in the fields they all wore them cunningly looped up about the hips with a cord, making at once a puff flounce and a Bloomer. Many wore leggings, fastened below the knee, earrings, necklaces and finger-rings were very common, indeed universal. One girl wore three white skirts, looped up so as to show the three embroidered edges, making a full display about her knees, as do our public dancers. These embroidered skirts were clean and white, and her plaid gingham above them sat neatly to her form and was well made. Her turban was put on with care, and her gold earrings, with their long coral pendants danced merrily as she flourished her hoe among the cane-hills with the air of a princess. I saw in all this not a false pride, but a sublime self-respect—a desire to do as the white people do, to whom all people bow, and who *will not wear the chains of slaves.*

Their houses on the estates looked comfortable, and through the open doors we saw tables, chairs, bed, pictures on the walls (not from Raphael's hands, to be sure); around their doors chickens, ducks, turkeys and young goats, which they have the privilege of raising and selling.

We know that the law will not allow an overseer or manager to strike them; we know that they work only ten hours per day, unless they choose; we know that Saturdays and Sundays are their own; that each man and woman is en-

titled to a spot of land, to till for vegetables; that the laborers on an estate own all the fruit that grow upon the estate, and that each laborer is paid by law for all his lawful working hours, and extra for all hours he chooses to work that are not lawful; that men and women receive the *same price* (mark that, too) for the same labor.

Your readers can draw their own conclusions upon the question whether the state of these people now is worse than at first. I have been in numbers of their houses, and find many of them better kept than those of foreigners who live upon our railroad and canal routes; much better than the negro cabins. Besides the nine government school-houses, there are many others—some kept up by private endeavors, some by church influence—so that a great many of the children are being taught to read. I have conversed with some of the teachers, and they tell me that the children learn quite as fast as white children. One gentleman here, who has a human heart, assures me that the children born in freedom are much brighter, smarter and better looking than those born in slavery, taking them *en masse*; and no one has yet asserted that the emancipated slaves were not as moral as before, while many admit that they are more so, and improving.

But my letter grows too long. I will treasure up thoughts as I go, and preserve them till I get home, as I shall the beautiful shells and seeds of the Islands, for future use.

Yours, FRANCIS D. GAGE.

NATURAL HISTORY OF BIRDS.

BY YARDLEY TAYLOR.

(Continued from page 190.)

The dove is a common bird here during this season; they leave at the commencement of cold weather and return again as the warm season begins. Their plaintive coo, the only note they possess, is indicative of mild weather. This bird is of handsome form, and of a well known and uniform color. It builds a very imperfect nest, merely a few small sticks laid in the crotch of an apple or other tree, or some such place, and they frequently lay their eggs on the ground, without any preparation for a nest at all. They lay but two eggs at a time, which are white. The dove has been considered in all ages, the emblem of innocence, and well does it deserve that character. Whether our bird is the same as the dove of the Eastern hemisphere or not, it certainly is entitled to the same credit. It does not injure the farmer, the gardener or the fruit grower in any way that I know of, and as a part of its food at least must be insects, it is that far positively beneficial. The dove belongs to the pigeon family of birds, of which there are several varieties. The stock dove and the tame pigeon are examples as well as the carrier pigeon of the

East. But one of the most remarkable of this class is the wild pigeon of America, often called the passenger pigeon. Their habits are remarkably social. They continue in larger companies throughout the year than any other bird. Even in the breeding season they congregate in large numbers, and occupy forests of considerable extent; almost every branch of a tree capable of supporting a nest is occupied with one. Their nest, like the rest of the tribe, is very simple, merely a few sticks laid together in the forks of limbs. They lay but two eggs at a time. When the young are nearly grown, but unable to fly, persons living in the vicinity resort to their breeding places, and by cutting down trees, obtain large numbers of the young ones; they are considered excellent for the table. This practice is followed by the Indians, who encamp in their vicinity, and live upon the young brood. They are possessed of remarkable powers of flight and strength of wing, having been caught in the middle States with rice in their crops unmasticated, that they must have obtained from the rice fields of the Southern States; thus passing over hundreds of miles in a few hours. They are fond of all kinds of grain, and perhaps may feed somewhat on insects, but their chief food, in its season, is acorns and beech nuts. It is surprising how large an acorn they can swallow. They generally go south to Winter, and in the Spring pass on to the north and west in flocks, some of which are very large. Their fondness for society is taken advantage of at such times by sportsmen to their destruction, and many of them are taken in nets. By having some of them blindfolded, and fixed in such a way as to make them appear to be alighting on the ground when flocks come by, they are induced to alight also, and having grain spread on the ground where a net can be suddenly sprung over them, they are sometimes caught in large numbers. It requires close observation of their habits and dispositions to be a successful pigeon catcher.

Their flesh, though darker than that of the domestic fowl, is considered good and wholesome. This continent being so extensive, and their range of flight very great, they do not pass over the same region of country every year; sometimes we see few of them for several years, and then again every year for a time. Like most other birds they congregate the most where food is plenty. They are not singing birds.

The thrush is a bird of handsome form, with rather a long tail. The color of the upper part of the body is brownish, and lighter beneath. Its habits are very similar to most of our insect-eating birds; but its musical powers exceed those of any other bird we have. It is called the mocking bird of America.

It is delightful to hear this bird in the morning, perched on the top of a bush or small tree, pouring forth its music in such varied strains

and imitating the notes of almost every bird we have amongst us, and this for a considerable time. It delights more in bushy thickets than in open ground, hence it is rather a retired bird.

Another songster is commonly called the cat bird, from the similarity of one of its notes to the mew of a cat. It is smaller than the preceding, but similar in form. Its color is a blackish blue above and lighter beneath. Its habits are very similar. Both are charged with stealing our small fruits, but considering their good qualities, we ought to be willing to allow them a share by planting enough for all.

The blue jay is about the size of the thrush, with much the same habits, except that it is not so good a songster. It is, however, rather a noisy bird, making a peculiar jingling sound, somewhat similar to the rattling of a bunch of keys. We have a small bird of the same color, called the blue bird, but this is of quite a different habit. It builds in holes or openings in fence stakes, decaying trees or such places. They delight to find boxes put up for them about houses, and they seem quite domestic. Their appearance is considered a pretty good indication of the commencement of warm weather, and they are looked upon as the harbingers of Spring. The blue bird is rather pretty, though not much of a musician, and does but little injury to fruits.

Another beautiful singing bird is the oriole, or hanging bird. One variety is the Baltimore oriole, so called from the circumstance of its color of yellow and red, being that which Lord Baltimore clothed his soldiers with. Another variety called the black-winged oriole has black on the wings, and they build the most complete nests of any bird amongst us, the first variety. They select the high, outspread limbs of a large tree, with no limbs beneath—often the tulip tree, here called poplar, or any other—and pitch upon the very extremities of the branches, which are always drooping. Here they literally tie their nests to the end of the twigs, and suspend them below in the form of a bag or purse with a small opening at the top. To do this they make use of strong grass or any thread-like substances they can find. They will take any thread lying about houses or gardens that they can meet with, and may sometimes be seen tugging at a string that has been put to use, to get a part of it for their purpose. They wind these around the twigs of the branch, and sew them through and through the material of the nest in a very substantial and secure manner, making it very firm and strong. Nests of several years old may often be seen suspended to the limbs where they were built. They are lined inside with soft material.

An account was published some years ago of a nest of this bird being found that was made of

silver wire. It was supposed the bird had found the remains of an epaulette, such as military officers wear, which are sometimes made with fine silver wire, interwoven with other materials, and that having been decayed, the wire was in a condition for the bird to use. It was considered a great curiosity.

A rather small bird of the fly-catcher tribe is the king bird. It is of rather a dark lead color on the back and wings, and lighter underneath; they build in orchards and on other low trees, and make a substantial nest, lining the inside with wool or other soft material. The apiarian often charges him with eating his bees, as he is frequently seen sitting on the top of a small tree, fence stake, or even on a dead mullin stalk, where a fair view is to be had, and if a bee or other insect comes within sight, (and he appears to see a considerable distance,) he flies after and takes it on the wing, and then returns to his perch to eat it. Some assert that he only catches the drone or stingless bee; and if this is the fact, it removes the only objection made to this bird, as he feeds altogether on insects. He is a pugnacious little fellow, and will fly after and attack any larger bird that comes near his nest, annoying them by keeping above and striking at them with his wings or bill, and after they pass some distance from his habitation, he will sail back twittering as if he had achieved some great success. Their eggs are whitish and speckled.

Another small bird of the fly-catcher class, is the pe-wee, or Phebe bird. Like the king bird they catch insects on the wing, but imitate some varieties of the swallow in the building of their nests. They select an upright part of a building, where a small projection is found with a protection overhead, such as under the eave of an out-building, or some suitable place inside. Here they begin by plastering some soft mud or clay, mixed with small roots, fine grass or moss, and, as it hardens, they add to it, until they make quite a commodious nest, which they line with feathers or other soft substances. Their cry is very similar to the word pe-wee or pe-wit; they have few notes.

(To be continued.)

ITEMS OF NEWS.

COOPER INSTITUTE.—Peter Cooper, of New York city, has just formally conveyed, by deed, to a Board of Trustees, "The Cooper Union, for the Advancement of Science and Art,"—popularly known as the Cooper Institute. The trustees hold office for life, but may be removed by the Supreme Court, or resign. The profits of the Union are to be devoted to the following objects:

"Regular courses of Instruction at night free to all, on the application to the useful occupations of life of social and political science. The support and maintenance of a free reading room, of galleries of art, and of scientific collections. To provide and maintain a school for the instruction of respectable females in the arts of design, and, in the discretion of the Board of

Trustees, to afford respectable females instruction in such other arts or trades as will tend to furnish them suitable employment. As soon as, in the opinion of the board of Trustees, the funds, which shall from time to time be at their disposal, will warrant such an expenditure, such funds shall be appropriated to the establishment and maintenance of a thorough Polytechnic school, the requirements to admission to which shall be left to the discretion of the said Board of Trustees, and shall be specifically determined by them, from time to time, and which school shall, as far as possible, and as soon as possible, be made equal to the best technological schools now established.

ST. DOMINGO.—The Government of St. Domingo has ceded, to a French and English company, for forty years, the right to work the coal mines of the country; for twenty years, the guano deposits, and for forty years, the silver, gold and copper mines. The conditions are numerous, but the principal ones are that the company shall employ sufficient capital to prosecute the work vigorously; pay ten per cent. on the rough products of the mines and on each quintal of guano; open a road from Santiago to Puerto Plata, and advance, on account, a million of francs to the Government, payable in Paris in four months from the date of these concessions.

Two weeks ago there passed through the Welland canal, from Upper Lake ports, the following vessels bound for Europe: From Detroit, Caroline, and G. D. Dousman, for Liverpool; Gold Hunter, for Bordeaux; Grand Turk, for Hamburg—and from Cleaveland, J. G. Deshlor, Queenstown. They were all loaded with staves and lumber.

FEMALE PREACHERS.—At the late session of the Des Moines (Iowa) Conference of the United Brethren, it was "Resolved, that we recommend those sisters, who have grace and ability to preach, to act as co-laborers with us." According to this action, Pheba Panton and Elizabeth Frankhouser were granted recommendations to labor as preachers.

ARIZONA.—The *Arizona*, published at Tucson, Arizona, a file of which has been received by the overland mail, contains the proceedings of a meeting held in Arizona city on the 8th inst., at which expressions of strong disapprobation of the course of Congress towards Arizona were made, as well as an urgent request for the co-operation of the citizens throughout the Territory, with a view to establish and maintain an independent Government.

CAMELS.—The *Selma* (Ala.) *Sentinel*, of May, says: "The camels purchased from Capt. Machado, last week, seem to answer many useful purposes. The other day, one of the animals, with rider, brought twelve bushels of shelled corn to town to mill. So one camel, in milling alone, will answer the purpose of a wagon and two mules, and will travel over the ground four times as quick as two mules. We understand that they have been tried in the plow, and answer the purpose admirably, being docile and easily managed."

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Flour is quiet. Receipts of Flour continue light, and holders are generally firm. Sales of good superfine are reported at 67 1/2 a \$7; common extra at \$7 00, and good Western extra at \$7 50. The sales to the home trade are limited between \$6 75 and \$8 50 for fancy lots. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 50, and the latter at \$4 per barrel.

GRAIN.—Wheat is in limited demand but steady. Sales of Pennsylvania and Western red at \$1 64 a 1 68, and white at \$1 75 a 1 85. Rye is selling at 90 c. Corn is firm, but comes in slowly. Sales of yellow at 90

cts., afloat. Oats are in fair demand. Sales of prime Pennsylvania at 50 a 51 cents.

CLOVERSEED comes forward slowly, and prime lots are in demand at \$5 50 per 64 lbs. No change in Timothy or Flaxseed. The former is worth \$1 87 1/2 a \$2, and the latter \$1 70 a 1 72 per bushel.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 56 cents to 70 cents per week.

Extra charges for each twelve weeks Latin, Greek, French, Penciling, and Pellis work, each \$2.00; Water Color, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them: SAMUEL BATCHELDER, A. M.

Principal.

Atleboro', Bucks Co., 5th mo., 28, 1859. 6m.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address

WM. HICKLEN,

Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., where he proposes to keep always a large assortment of Friends' Books, together with various other valuable Books.

Libraries with whatever books desired, at low prices.

HENRY LONGSTRETH,
Chester Co. Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

EATON ACADEMY, KENNETT SQUARE, CHESTER CO., PA.—This Institution will open its summer term for the reception of Pupils of both sexes, on Second day the 2nd of 5th mo. next, and continue in session twenty weeks. Circulars, containing terms and particulars, will be forwarded to every person requesting the same, on application to the Proprietors, or to William A. Chandler, Principal Instructor.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SIXTH MONTH 18, 1859.

No. 14.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

(Continued from page 195.)

It is abundantly evident, from the convictions of our own minds, as well as from the scriptures, that God does not impute to us any sins but those which we have ourselves committed; for who has ever felt any compunction for the sins of his ancestors? If, therefore, "our heart condemn us not, then have we confidence towards God." 1 John iii. 21. It is true that God said to the children of Israel, "I the Lord thy God am a jealous God, visiting the iniquities of the fathers upon the children unto the third and fourth generation;" but observe, he adds, "of them that hate me." Ex. xx. 5. It is evident, however, that we do feel the natural effects of our fathers' conduct, whether it be good or whether it be evil. He whose life is regulated by the principles of pure religion, endeavors to bring up his children in the way they should go, and when he is gone, they will feel the good effects of his virtuous example and unsullied reputation. But, on the contrary the wicked man often subjects his children to misery and disgrace, even to the third and fourth generation. How awful, then, is the responsibility of parents! How should these considerations incite us to diligence and watchfulness, lest it be said to us in the day of solemn reckoning, "Where are the lambs that I committed to thy charge?"

So far is the doctrine of original sin from being taught in the Bible, that there are several passages directly against it. One of the most striking of these is in the book of the prophet Ezekiel, who was sent to the children of Israel, ex-

pressly to reprove them for having taught this doctrine. He says, "What mean ye that ye use this proverb concerning the land of Israel, saying, 'The fathers have eaten sour grapes, and the children's teeth are set on edge? As I live, saith the Lord, ye shall not have occasion any more to use this proverb in Israel. Behold all souls are mine; as the soul of the father, so also the soul of the son is mine: the soul that sinneth, it shall die.'" xviii. 2-4. "Yet, say ye, why? doth not the son bear the iniquity of the father? When the son hath done that which is lawful and right, and hath kept all my statutes and done them, he shall surely live. The soul that sinneth, it shall die. The son shall not bear the iniquity of the father, neither shall the father bear the iniquity of the son: the righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him. But if the wicked will turn from all his sins that he hath committed, and keep all my statutes, and do that which is lawful and right, he shall surely live, he shall not die. All his transgressions that he hath committed, they shall not be mentioned unto him: in his righteousness that he hath done he shall live. Have I any pleasure at all that the wicked should die, saith the Lord God: and not that he should return from his ways and live," verse 19-23. "Yet ye say, the way of the Lord is not equal. Hear now, O house of Israel! Is not my way equal? Are not your ways unequal?" v. 25.

This language appears to me as strong as it could be against the doctrine of original sin. The language of Jesus Christ is also conclusive on this point. He says, "Suffer little children, and forbid them not, to come unto me; for of such is the kingdom of heaven." "Verily, I say unto you, except ye be converted, and become as little children, ye shall not enter into the kingdom of heaven." Matt. xviii. 3, and xix. 14. Now it is evident from this, that little children must be born in a state of purity; for no unclean thing can enter into the kingdom of God.

I shall now proceed to consider the fourth and last objection, which relates to the present condition of man as displayed in the world around us. And I must acknowledge, that a large proportion of mankind appear to be so far alienated from the Divine harmony, that we may consider them in a fallen state; but this fact being admitted, it does not follow, as a necessary conse-

quence, that they were born in a state of impurity and sin : it only shows that all are born with appetites and propensities, which, if improperly indulged, will lead to sin ; and Adam himself must have been created with similar appetites, or else he never would have fallen. Let us examine some of these appetites and desires, and I think we shall find them wisely adapted to the condition of man.

The first appetite that we discover in infancy, is hunger, which prompts the child to partake of food, before it can reason upon its use ; and if its food is withheld, it is prompted to cry for it, so as to excite the compassion of its parents. But it is not in childhood only that this appetite is subservient to our welfare. How many there are who would neglect the proper nourishment of their bodies, if they were not impelled to it by the cravings of hunger, and by the hope of that pleasurable sensation which is derived from partaking of food ? Yet the desire for food, thus produced in man, will, if improperly indulged, lead to the vice of gluttony. Nearly the same observations will apply to the appetite of thirst, and the pleasure that attends its gratification. yet the inordinate indulgence of this appetite leads to the dreadful vice of intemperance, which has wrought such misery and desolation in the human family. The desire for rest is also necessary for recruiting our bodily strength, and its gratification is attended with a sensible pleasure ; but its improper indulgence leads to indolence, disease, and depravity. The desire for action is one of our natural propensities that is very conspicuous in childhood, and its exercise is conducive to the health of both body and mind. It is this that often impels to useful labor, and renders even labor a pleasure. But how many evils arise from the desire of employment, when it takes a wrong direction ? Thus, the vice of gambling is one among the many expedients that have been invented " to kill time," and to fill up those vacant hours which ought to be devoted to nobler purposes. The desire for knowledge is one of the noblest faculties of the mind, and the exercise of it is accompanied by an exalted pleasure : yet this desire, when directed to frivolous or useless objects, degenerates into a vain curiosity, which is productive of evil.

Thus we might proceed to examine all the desires and affections of our animal and spiritual natures, and we should find them all to be the good gifts of a gracious God, and " trees of his right-hand planting ;" but, like the elements of the natural world, they are all liable to abuse. Thus, conjugal and parental love are good in themselves, but they may degenerate into idolatry. Emulation may lead to envy ; and the desire for power may end in avarice or ambition.

It has pleased the benevolent Author of our being to attach a peculiar pleasure to the gratification of these desires, when they are kept within

their proper bounds : but no sooner do we indulge them beyond this point, than they become the instruments of our chastisement. Even that natural feeling of displeasure or aversion, which is occasioned by a positive injury inflicted upon ourselves or upon others, if it be permitted to arise to anger, will give us pain. Yet I believe it is a good principle, when directed only against the wickedness of men, without being accompanied by any ill-will towards them ; for the Divine Being himself condemns " all unrighteousness," at the same time that he is " kind even to the unthankful and the evil."

How beautiful—how perfectly adapted to our wants, is the original constitution of man ! especially when we take into view that Divine principle of light which shines in the soul, and enables us to perceive what is our duty towards God and our fellow-men ; which is comprehended in " doing justly, loving mercy, and walking humbly with God !" Mic. vi. 8. The virtuous affections have been likened to the gales which waft the vessel on her way, and this Divine monitor is the pilot who sits at the helm and guides her to the destined port. How much it is to be lamented that the free teachings of this divine principle are neglected, while so many are looking outward to men and to books for instruction, instead of looking within themselves for the kingdom of heaven, which consists in " righteousness, peace, and joy in the Holy Spirit."

John. I remember in our last conversation thou told us that man has " nothing good in himself." Does not that sentiment conflict with some of the views thou hast just expressed ?

Father. I said he had nothing good in himself independent of the Divine Being ; which does not conflict with my present views ; for " there is but one that is good, that is God." However noble may be the faculties he has given to man, they cease to be good as soon as they cease to be governed by him. God is the sun and centre of his spiritual creation ; and as soon as we depart from under the restraining influence of his love, we fall into a state of disorder and confusion. But he desires that we should serve him from choice, and not from compulsion ; and therefore, while he has bound the material universe in chains, he has " left free the human will."

All the dealings of God towards his creatures are founded in eternal love : even the sufferings which result from the abuse of his gifts, seem intended to bring back the delinquents to the path of rectitude, which is the only state where happiness can be attained. His commands and his prohibitions are all for our good, and are wisely designed for the promotion of our present and eternal welfare. It is a law which he has stamped upon our nature, that virtue will always produce happiness, and vice will always bring misery : they do so now, and they must continue to do so forever.

How important then it is, that we should cultivate those benevolent affections which are calculated to bring us into the image of God; for, as we become "partakers of his nature," we shall participate in his happiness; and when we leave this scene of probation, we shall be fitted to enter into those spiritual joys which are prepared for the righteous.

How ardently do I desire that all my fellow creatures may become sensible of the true dignity of man: which does not depend on the abundance of riches, nor on the attainments of learning, nor on the possession of intellectual power; but it consists in being made "partakers of the Divine nature," enjoying communion with the Holy Spirit, and becoming "heirs of God, and joint heirs with Christ."

(To be continued.)

"The general lapse of mankind has scattered them away from the fold of unity, into such a thick and wild wilderness of disparity and confusion, that even those who are sensible of it, and intent on a remedy, are continually taking offence at the contrary direction in which they see each other moving. Whereas, if each of these well-meaning travellers would keep his eye to his *own proper foot-path*, and go quietly forward, they would all gradually approximate the point of unity.

That which constitutes a good conscience, is a willingness to conform to what we believe to be truth, in *all* its appearances; those, therefore, who act up to their best apprehensions of right, will never incur condemnation for a want of such knowledge, as is providentially withheld from them.

To the Editors of Friends' Intelligencer.

The following letter was put into my hands in the year 1818, by a dear female Friend in whose house I had been an inmate a few years previous to my leaving my native land (England,) to come to America; the contents of which I may say, have been to me as a watch-word through life. If you should consider it worthy of publication, it is at your disposal.

Respectfully, &c., J. D.

5th mo. 16th, 1859.

Gateback, 6th mo. 12th, 1818.

My dear Friend,—As we are soon to part, in all probability to meet no more, I believe I shall not feel easy without endeavoring to express the earnest solicitude I feel, not only for thy present, but eternal welfare, and that whether prosperity or adversity may be thy future portion, thou mayest steadily and invariably pursue that path which will lead to happiness and peace.

Trials and difficulties of various kinds thou mayest have to encounter, but in every conflict may strength be afforded to look to that Power

who can comfort and support the mind under the most distressing circumstances. Thou hast, my dear friend, in some degree experienced the uncertainty and disappointment that often attend the most flattering prospects here, but I have no words that can convey an idea of the desire I feel, that it may be the means of weaning thy mind from things of a perishing nature, and staining this world with all its deceitful, alluring pleasures, in thy view. Many are those for whom I feel most anxiously concerned, that their conduct through life may be such as to insure to them peace here, and happiness hereafter. From some of these I am afraid I shall have to experience much disappointment, but from thee I do hope better things. Be on thy guard, I most earnestly entreat thee; thou art now, as it were, beginning life again, every thing may depend on the choice thou art now to make; nothing less than an humble dependance on thy Heavenly Father can preserve out of the snares and temptations that will in all probability surround thee; do not give way in little things; be firm; on no occasion, I beg of thee, use any other than the plain language, and in every part of thy demeanor and conduct be consistent with the profession thou art making. Remember, my dear friend, the comfort, the consolation it will be to thy aged and affectionate parent, to know thou art preserved out of the many evils that are in the world, who, if I have any right apprehension, desires for his children a possession in the *Truth*, in preference to all other things. I am well aware I can say nothing on this very important subject, but what thou art already well acquainted with. When I took up my pen it was not to inform, but to remind.

I am very conscious of much weakness, and have great need of the care and caution I have been recommending; but thy future welfare is of such importance, and my whole heart seems so interested in it, that I hope will plead my excuse.

The sympathy and kindness I have often experienced from thee, particularly on the occasion of my dear father's decease, I shall long remember, and when in a distant land, that thou mayest meet with the same affectionate attention in a time of trial, is what I most earnestly crave for thee.

* * * * *

Hoping thou will never experience that sorrow which will always attend a deviation from the path of duty, and humbly and reverently craving for thee the divine blessing, I bid thee most affectionately farewell. A. R.

PASSION.

"Passion, more than anything, deprives us of the use of our judgment; for it raises a dust very hard to see through. I have often thought that a passionate man is like a weak spring, that cannot stand long locked; and it as true that those

things are unfit for use, that cannot bear small knocks, without breaking. He that cannot bear contradiction, may, with all his wit, miss the mark. A man's strength is shown by his *bearing*. He that corrects out of passion, raises revenge sooner than repentance. It is one of the most fatal errors of our lives, when we spoil a good cause by an *ill management*; and it is not impossible that we may mean well in an ill business; but that will not defend it. If we are sure our end is right, we are too apt to gallop over all bounds to compass it; not considering that lawful ends may be very unlawfully attained. There is a troublesome humour, some men have, that if they may not lead, they will not follow. This comes of an over-fulness of ourselves, and shows we are more concerned for *praise*, than the success of what we think a good thing."

For Friends' Intelligencer.

*Statistics of Goose Creek Monthly Meeting,
Loudoun County, Virginia.*

Having had occasion, a short time since, to assist in correcting our record of births and burials, I felt some curiosity to ascertain some further statistics of this meeting, and see whether it was increasing or decreasing in point of numbers. With this view I consulted the minutes of the monthly meeting, to find the number of members who have had certificates from this to other Monthly Meetings, and from other Meetings to this. This examination was not extended further back than 1820, as our record of births and deaths had been imperfectly kept previous to that time.

At present, there are families with one person a member,	22
Heads of families with more than one,	56
Making, of families and parts of families,	78
Number of adult males,	96
do. do. females,	122
do. males under 21 years of age,	65
Females, do. do.	64

Whole numbers of members,	347
Number of births, from 1820 to 1858, inclusive,	269
do. deaths, in same time,	122
do. do. under 21 years of age,	53

Or less than 20 per cent. of the number of births.

Of the deaths,	
There were 30 per cent. died, under 5 years of age.	
do. 36.5 do. do. 10 do. do.	
do. 43 do. do. 21 do. do.	
do. 50 do. do. 30 do. do.	
do. 60 do. do. 40 do. do.	
do. 75 do. do. 60 do. do.	

And 25 per cent. over 60 years.

In this time 177 persons have had certificates from this meeting to other meetings west of the Alleghanies, and 65 persons have had certificates to various other meetings.

145 persons have had certificates to this Meeting from other Monthly Meetings—showing the removal of 97 more persons from here than have been received.

There have been 90 persons received into membership, and 114 persons disowned from the Society. Also 55 marriages have been authorized by the Monthly Meeting; 22 of which were with members from other Monthly Meetings. In the same time there were 20 members applied for certificates, to accomplish their marriages with members of other Monthly Meetings.

From this date we have of received members,	90
Of members removed from other Meetings,	145
Births,	269

Whole number,	504
From the same time, disownments,	114
Deaths,	122
Members had certificates of removal,	242
	478

26

Showing that there are 26 more members now than in 1820 belonging to this Monthly Meeting.

It is proper to remark that 10 of the number mentioned as having been disowned, left us on account of the separation that took place some years ago, and were not disowned for immoral conduct. The number of deaths being less than one-half of the number of births, and 50 per cent. of the deaths being those who had attained the age of 30 years, proves this to be, as it really is, a very healthy region of country.

The first permanent settlements here were made from 1730 to 1745 and the dates of the original patents for land were generally between those years. Friends became early purchasers of lands here, probably some of them from the proprietor, Lord Fairfax, who owned the land under the authority of the British crown. They emigrated principally from Pennsylvania, New Jersey and some from Delaware. The records of Goose Creek Monthly Meeting do not show when Friends' meetings here were first set up, as that was itself established in 1786, being before a branch of Fairfax Monthly Meeting. Fairfax meeting was established previous to 1757; it took its name from the county. In that year the county was divided, and this part was called Loudoun. Two small preparative Meetings, formerly existed in this county, one of them belonging to the Monthly Meeting of Fairfax, and the other to Goose Creek, but they were laid down some years ago. Friends here formerly belonged to Philadelphia Yearly Meeting, as they had generally emigrated from within its limits, and the Meetings were established under its authority.

Friends of this place at one time were associated with Friends in Maryland in a Quarterly Meeting capacity, under the title of Warrington and Fairfax Quarterly Meeting, and, if I am not mistaken, Fairfax Monthly Meeting itself was associated with Friends at Monocacy, in Maryland, as a Monthly Meeting. The records of

those meetings might show when some meetings here were established, but the records of Quarterly Meetings still further in Pennsylvania will probably have to be consulted to ascertain when the first Meetings on this side of the Potomac were set up.

In some of the counties of Virginia, many Meetings have been laid down, and others much lessened, while Goose Creek has maintained its own in numbers, being probably as large now as it ever was. Friends here have kept themselves quite compact as a body, and generally been willing to give more for land lying near meeting, than farther off; and the high price of land near meeting has prevented others from purchasing to much extent. The healthiness of the country has enabled the Meeting to keep up its numbers, notwithstanding the heavy drain by emigration to the West. Many Meetings there have had large additions from this county.

YARDLEY TAYLOR.

For Friends' Intelligencer.

ON THE USE OF SLAVE PRODUCE.

As the enslaving a man embraces a far greater amount of injustice and wrong than highway robbery, and the legalizing it has no tendency to diminish its injustice; and as all honest men are conscientiously opposed to the purchase of stolen goods, under such circumstances upon what principle can we purchase the products of slave labor? This is a simple, plain question, intimately connected with morality and christianity; and yet many appear disinclined to answer it, even to themselves. Now what is the ground of this disinclination? Is it because it is not perceived that the purchase of such products is aiding and patronizing the system of slavery? Or is it because the refusal to participate would conflict with general custom, interest or convenience?

Now if we can clearly see that custom and aggressive laws do not impair the slave's right to liberty, and to a compensation for his labor, any more than if he were deprived of it, contrary to law and custom, how is it, that we can shield ourselves in the purchase of slave-labor products, by the force of law and custom, without a practical denial of the principle by which we pronounce the slave system criminally unjust and cruel?

"If ye love them which love you, what reward have ye? do not the publicans the same?" If ye float on with the tide of law and custom, "what reward have ye?" do not even the slaveholders "the same?"

That morality and christianity, which rises no higher than tyrannical laws and customs, must be greatly below that taught by the blessed Jesus, in his memorable sermon on the mount, when he took occasion to say, "except your righteousness shall exceed the righteousness of

the Scribes and Pharisees, ye shall in no case enter into the kingdom of heaven."

Is it possible that the enslavement of our fellow men, with all its attendant evils, is supported and continued in accordance with morality and christianity? and if not, it is high time the matter should be looked into, as a subject of deep interest and solicitude, even to those who may deem themselves unconnected with the slave system.

DAVID IRISH.

Duchess Co., N. Y. 5th mo. 1859.

CHARLES LAMB.

(Continued from page 203.)

Men and the things made with hands were, indeed, the chief early objects of Lamb's veneration. He had no passion for nature, save human nature, no veneration for scenic beauty beyond the walls of a city. He left to the poets and tourists all interest in the wild, scowling mountain, the black, yawning cavern, the moaning forest, and the green, sunny plains. The pensive old Samuel Salt, the stately Coventry, thin Two-penny, and meagre Wharry, had more charms for him, in the peculiarities of the physique, than giant Helvelyn and all its kindred mountains. He often wrote to his poet friends upon this subject of the city and rural life, and the following is the determined Cockney's deliberate averments to Wordsworth: "I have passed all my days in London, until I have formed as many and intense local attachments as any of you mountaineers can have done with dead nature. The lighted shops of the Strand and Fleet Street; the innumerable trades, tradesmen and customers; coaches, wagons, playhouses; all the bustle and wickedness round about Covent Garden; the watchmen, drunken scenes, rattles,—life awake, if you awake, at all hours of the night; the impossibility of being dull in Fleet Street; the crowds, the very dirt and mud, the sun shining upon houses and pavements, the printshops, the old bookstalls, parsons cheapening books, coffee-houses, steams of soups from kitchens, the pantomimes—London itself, a pantomime and masquerade—all these things work themselves into my mind, and feed me without a power of stinting me. The wonder of these sights impels me into night-walks about her crowded streets, and I often shed tears in the motley Strand from fullness of joy at so much life." Such were Lamb's emotions, and they were the true emotions of his nature. A city is insufficient to satisfy the cravings of the whole man, it is true; teeming as it is with all the varied excellencies of art, it is yet destitute of those God-created aspects of the beautiful from which the artist derives his aspirations, and art its form. The whole man cannot know development, if he only feels the warmth of a brick-shaded sun, and beholds the glories of a smoke-obscured moon and stars.

Flower-potted rose-trees and boxes full of mignonne cannot compensate for the old primeval forests and the broad, flower-gemmed prairies; but still, the amount of man's nature, which urbane associations develop, is as much human nature as that which is nursed in woods and wilds and solitary places; and therefore Lamb's love of the Strand and the Temple seems to us to be as amiable and delectable, though less grand and poetical, than Wordsworth's love of the lakes. Lamb's character was eminently social, and if he made a visit to the country, it was not so much to gaze upon green fields as upon the face of a friend.

The most sublime view of Lamb's character, however, and indeed it is the highest of the morally sublime, is obtained by penetrating into his domestic sanctuary, and lifting up the veil from the deepest fountain of his heart affections. In the biographies hitherto published of him, there is a solemn and impenetrable silence maintained regarding the causes of Lamb's celibacy and his devoted attachment to his sister. That attachment and devotion were mutual, it is true: but in the ordinary circumstances of life, it was not necessary that a youth should suddenly forego all the hopes and endearments of wedded love, in order to devote himself to a maiden sister, who was ten years older than himself. The world knew that Lamb loved, and although he often alluded to his early attachment as a fitting passion, those who knew him best were aware that from no light and transient feeling could spring the warmest expressions of his muse. The grave has at last closed over Charles Lamb, and that dear sister Mary, for whose sake he willingly sacrificed the dearest and strongest affections of the human heart. All the hearts that would have trembled at the terrible revelation are now cold, and all the cheeks that would have become bloodless at the recital, are now veiled by the green turf; and the world at last knows the fulness of that self-sacrifice, and the grandeur of that moral heroism which constituted the life of the gentle Elia.

In a letter to Southey, recommending one of his early broken-down friends to the consideration of the author of "Madoc," Lamb makes the following allusions to that awful domestic calamity to which we have alluded, the murder of his mother, in a fit of insanity, by his sister Mary—that Mary who was the only sensible woman whom Hazlitt ever met—that Mary whose soul was as gentle and genial as that of childhood—that Mary whom he bore about with him in all his visitings, and who constituted a part of himself in all his friendships—that Mary whom he never went abroad with for twenty years, without a strait waistcoat in his pocket; the sister whom he fondly loved and tremblingly watched until his death, lest her terrible malady might again break down the barriers of her reason.

"Poor ——!" he says, in his own charitable way to Southey, "I am afraid the world, and the camp, and the university, have spoilt him among them. 'Tis certain he had at one time a strong capacity of turning out better. I knew him, and that not long since, when he had a most warm heart. I am ashamed of the indifference I have sometimes felt towards him. I think the devil is in one's heart. I am under obligations to that man for the warmest friendship and heartiest sympathy, even for an agony of sympathy, expressed both by word, and deed, and tears for me, when I was in my greatest distress. But I have forgot that, as, I fear, he has nigh forgotten the awful scenes which were before his eyes, when he became a comforter to me." The intimate friends of Lamb alone knew the meaning of this heartrending reference; the secret of the fatal catastrophe had been carefully retained by all cognizant of the fact, and even the notice in the coroner's record had been guarded from publication. It was this tragic occurrence which determined Charles to break asunder all tenderer ties, and religiously devote himself to the care of his sister. What a melancholy interest does this fact give to the following beautiful phantasmagoria from the essays of Elia: "Then I told how for seven long years, in hope sometimes, sometimes in despair, yet persisting ever, I courted the fair Alice W—n; and as much as children could understand, I explained to them what coyness, and difficulty, and denial meant in maidens, when, suddenly turning to Alice, the soul of the first Alice looked out at her eyes with such a reality of representation, that I became in doubt which of them stood there before me, or whose that bright hair was; and while I stood gazing, both the children gradually grew fainter to my view, receding and still receding till nothing at last but two mournful features were seen in the uttermost distance, which, without speech, strangely impressed upon me the effects of speech: 'We are not of Alice, nor of thee, nor are we children at all. The children of Alice call Bartram father. We are nothing, less than nothing, and dreams. We are only what might have been, and must wait upon the tedious shores of Lethe millions of ages before we have existence and a name.'"

If the uncommon sacrifices which Lamb made for his sister's sake were worthy of admiration, the spirit in which he made them is much more so. The first little copy of his verses, which he published in conjunction with Coleridge and Lloyd, was dedicated to her; and all the tender endearments which he lavished upon her, seemed rather to flow from the depths of filial gratitude than fraternal sacrifice.

Of the dedication of his poems to his sister Mary, he says to Coleridge, in 1796, "This is the pomp and paraphernalia of parting," in allusion to his love, "with which I take my leave

of a passion which has reigned so royally (so long) within me. I fling it off, pleased and satisfied with myself that the weakness troubles me no longer. I am wedded, Coleridge, to the fortunes of my sister and my poor old father. O my friend, I think sometimes could I recall the days that are past, which among them should I choose? Not those merrier days, not the pleasant days of hope, not those wanderings with a fair-haired maid, which I have so often and so feelingly regretted, but the days, Coleridge, of a mother's fondness for her schoolboy. What would I give to call her back to earth for one day, on my knees to ask her pardon for all those little asperities of temper which from time to time have given her gentle spirit pain; and the day, I trust, will come. There will be 'time enough' for kind offices of love, if heaven's eternal year be ours. Hereafter her meek spirit shall not reproach me."

In a subsequent letter, he alludes more particularly to Mary. "My sister has recovered from her illness. May that merciful God make tender my heart, and make me as thankful, as in my distress I was earnest in my prayers. Congratulate me on an ever-present and never-alienable friend like her." The force of these tender reflections, and the intensity of that concealed grief, become terribly affecting and sorrow-inspiring when the veil of obscurity is raised from the cause of their enunciation. The life of him, who seemed to exist that he might fuse men into love, and reconcile them to the cares of this world, by sharing their burdens of sorrow in the lightness of his own, was, in truth, a long and ever-acting tragedy, and it was upon the agony of his heart that its loves and joys were nursed. How mysterious and incomprehensible is the deep unknown! how feeble is the partition between the beauties and horrors of human passion! May heaven have requited the self-sacrificing love, and soul-ennobling heroism of Elia.

The only portrait worthy of recognition that was ever taken of Lamb was executed by Hazlitt in 1804, and was amongst the last works of that beautiful painter, before he laid down the pencil for a gray goose-quill. The following verbal limning is from the pen of Sergeant Talfourd: "Methinks I see him before me now as he appeared at our first meeting, and as he continued, with scarcely any perceptible alteration to me, during the twenty years of intimacy that followed and were closed by his death. A light frame, so fragile that it seemed as if a breath would overthrow it, clad in clerk-like black, was surmounted by a head of form and expression the most noble and sweet. His black hair curled crisply about an expanded forehead; his eyes, softly brown, twinkled with varying expression, though the prevailing feeling was sad; and the nose slightly carved, and delicately curved at the

nostril, with the lower outline of the face regularly oval, completed a head which was finely placed on the shoulders, and gave importance and even dignity to a diminutive and shadowy stem. Who shall describe his countenance, catch its quivering sweetness, and fix it forever in words? There are none, alas, to answer the vain desire of friendship. Deep thought striving with humor, the lines of suffering wreathed into cordial mirth, and a smile of painful sweetness, present an image to the mind it can as little describe as lose."

In 1825, Lamb retired from the India House. He had long wished for his superannuation; but when it came, the charm of liberty had vanished with the idea of his drudgery. Age was beginning to lay its whitening hand upon his brow, and death to subtract from the number of his early friends, and even London was now becoming less necessary to his existence. He removed to Colebrook Cottage, Islington, where he maintained himself in rural state until his sister's health constrained him to remove to loggings in Enfield, and finally to Edmonton. Cheered by the society of the orphan Miss Isola, whom they had adopted and reared as a daughter, Charles Lamb and his sister still maintained the earnest affection of their childhood, while the young maiden made up to Elia for the loss of the companionship in his rambles of his now feeble sister. But love, the bond of their little household's union, divided the triplex knot at last, which it had so auspiciously tied. Miss Isola was married, and now Lamb was left to walk abroad alone. In taking his daily morning walk on the London Road, as far as the "Bell at Edmonton," he stumbled against a stone, fell, and slightly injured his face. The trivial wounds seemed healing, when erysipelas attacked his head, and he died, placidly murmuring the names of Maxon and Proctor and others of his friends.

He died in his sixtieth year, in 1835, and was buried in Edmonton churchyard, where now slumbers the ashes, of this most amiable and remarkable man. The world deplored his loss; for the world's best hearts had lost one of their best friends.—*Littell's Living Age.*

Learn to pursue a virtue from the man that is blind, who never makes a step without first examining the ground with his staff.

The surest way to purchase happiness, must be to let as little of our time as possible slip away unobserved and unimproved.

The heart is the fountain, and our words are the streams; and if the fountain be muddy, the streams proceeding from it cannot be clear.

We often overlook the blessings which are in our possession, to hunt after those which are out of our reach.

A wise man will desire no more than what he may get justly, use soberly, distribute cheerfully and leave contentedly.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SIXTH MONTH 18, 1859.

We would call attention to the advertisement for a teacher in Darby Monthly Meeting School, a situation which may serve as a stepping stone to a still more lucrative and desirable position.

AN INDIAN'S SPEECH.

In answer to a Sermon preached by a Swedish Missionary at Cannestoga, A. D. 1710.

In or about the year of our Lord 1710, a Swedish missionary preached a sermon at an Indian treaty held at Cannestoga, in which sermon he set forth original sin, the necessity of a mediator, and endeavored, by certain arguments, to induce the Indians to embrace the Christian religion. After he had ended his discourse, one of the Indian Chiefs made a speech in reply to the sermon; the discourse on both sides, was made known by interpreters. The missionary, upon his return to Sweden, published his sermon and the Indian's answer; having written them in Latin, he dedicated them to the University of Upsal, and desired them to furnish him with arguments to confute such strong reasonings of the Indian. The Indian's speech, translated from the Latin, is as follows:—

“Since the subject of his errand is to persuade us to embrace a new doctrine, perhaps it may not be amiss, before we offer him the reasons why we cannot comply with his request, to acquaint him with the grounds and principles of that religion he would have us to abandon. Our forefathers were under a strong persuasion, (as we are,) that those who act well in this life will be rewarded in the next, according to the degree of their virtues. And, on the other hand, those who behave wickedly here, will undergo such punishments hereafter as were proportionate to the crimes they were guilty of. This has been constantly and invariably received and acknowledged for a truth through every successive generation of our ancestors; it could not then have taken its rise from fable, for human fiction, however artfully planned and plausibly contrived, can never gain credit long amongst people where free inquiry is allowed, which never was denied by our ancestors, who on the contrary, thought it the sacred, inviolable, natural right of every man to examine and judge for himself.

Therefore, we think it evident that our notions of future rewards and punishments were either

revealed from heaven immediately to some of our forefathers, and from them descended to us, or that it was implanted in each of us at our creation by the Creator of all things. Whatever the method might have been, whereby God has been pleased to make known to us his will, and give us a knowledge of our duty, it is in our sense a divine revelation. Now we desire to propose to him some questions. Does he believe that our forefathers, men eminent for their piety, constant and warm in their pursuit of virtue, hoping thereby to merit eternal happiness, were all damned? Does he think that we, who are zealous imitators in good works, and influenced by the same motives as they were, earnestly endeavoring, with the greatest circumspection, to tread the paths of integrity, are in a state of damnation? If that be his sentiment, it is surely as impious as it is bold and daring. In the next place, we beg that he would explain himself more particularly concerning the revelation, if he admits of no other than what is contained in his written book? The contrary is evident from what has been shown before. But if he says: God has revealed himself to us, but not sufficiently for our salvation, then we ask, to what purpose should he have revealed himself to us in any wise? It is clear, that a revelation, insufficient to save, cannot put us in a better condition than we are without revelation at all. We cannot conceive that God should point out to us the end that we ought to arrive at without offering to us the way to arrive at that end. But supposing our understanding be so far illuminated as to know it to be our duty to please God, who yet has left us under an incapacity of doing it, will this missionary therefore conclude that we shall be eternally damned? Will he take upon him to pronounce damnation against us for not doing those things which he himself acknowledged were impossible by us to be done? It is our opinion, that every man is possessed with sufficient knowledge for his own salvation. The Almighty, for any thing we know, may have communicated himself to different races of people in a different manner; some say they have the will of God in writing; be it so; their revelation has no advantage over ours, since both must be equally sufficient to save, or the end of the revelation would be frustrated. Besides, if they be both true, they must be the same in substance, and the difference can only lay in the modes of communication. He tells us there are many precepts in this written revelation that we are entirely ignorant of; but those written commands could only be assigned for those who have the writings; they cannot possibly regard us. Had the Almighty thought so much knowledge necessary for our salvation, his goodness would not so long defer the communication of it to us. And to say in a matter so necessary he could not at one and the same time reveal himself to man-

kind, is nothing else than an absolute denial of his omnipotence.

Without doubt he can make his will manifest without the help of any book or the assistance of any bookish man whatever. We shall in the next place consider the arguments which arise from the consideration of Providence.

If we be the work of God, (which we presume will not be denied,) it follows from thence that we are under the care and protection of God, for it cannot be supposed that the Deity should abandon his own creatures, and be utterly regardless of their welfare. Then to say that the Almighty has permitted us to remain in a fatal error, through so many ages, is to represent him as a tyrant. How is it consistent with his justice to force life upon a race of mortals without their consent, and then to damn them eternally without ever opening to them the door to salvation? Our conceptions of the gracious God are much more noble, and we think that those who teach otherwise do little less than blaspheme. Again, it is through the care and goodness of the Almighty, that, from the beginning of time, throughout many generations to this day, our name has been preserved unblotted out by our enemies and unreduced to nothing. By the same care we now enjoy our lives, and are furnished with the necessary means of preserving these lives. But all these things compared, without salvation, are trifling. Therefore, since God has been so careful of us in matters of little consequence, it would be absurd to affirm that he has neglected us in cases of the greatest importance; admit he has forsaken us, yet it could not be without a just cause.

Let us suppose that some heinous crimes were committed by some of our ancestors, like to that we are told of another race of people; in such a case God would certainly punish the criminal, but would never involve us that are innocent in the guilt; those who think otherwise, must make the Almighty a whimsical, evil-natured being.

Once more, are the Christians more virtuous? or rather, are they not more vicious than we are? If so, how came it to pass that they are the objects of God's beneficence, while we are neglected? Does he daily confer his favors without reason and with so much partiality?

In a word, we find the Christians much more depraved in their morals than we are, and we judge from their doctrine by the badness of their lives.

Impressum Parthenopoli! per Molineum Aggrippain. Anno MDCCLXXXI.

Beware of the beginnings of bad habits; the worst habits are acquired, not at once, but by degrees.

The culture of the social feelings, under the dew and sunshine of religion, is a duty as well as a pleasure.

NATURAL HISTORY OF BIRDS.

BY YARDLEY TAYLOR.

(Continued from page 207.)

Several varieties of the swallow are met with here. They are characterized by very long and strong wings for the size of the bird. They take their prey altogether on the wing and are true fly-catchers.

One of these, the chimney swallow, is never seen to alight any where but in the chimney. That would seem to be an unfavorable resting-place, but they are so constituted as to prefer it before any other. They have short legs, but very strong and sharp claws, and as they must necessarily alight on the sides of the chimney, the feathers of their tail are rather short, with stiff stems, sharply pointed at the end; these enable the bird to prop itself up by the tail feathers, and thus ease the strain that would otherwise be upon their legs. Their nests are attached to the insides of the chimney, and are made of small twigs of trees, about an inch in length, glued together by some adhesive substance, and fastened to the wall of the chimney by the same material. They use no lining whatever. The nest is semicircular in shape, and seldom more than three inches across, and a little concave on the upper side. In this rough nest, they lay about four whitish eggs, and the young cling to it with great pertinacity. When nearly grown, they may be heard exercising their wings while clinging to their nest, as they must be fully able to fly before they can ascend out of the chimney. They seem to prefer chimneys whose fire places are not much used, and they congregate sometimes in such places in great numbers. I have often watched them in the evening, sailing by hundreds round and round the top of a chimney, previous to entering it to roost; when between sun-down and dark they would begin to descend into the chimney, and in a few minutes all would go down, sometimes in such numbers as to fill up the flue entirely, and attached to each other like a swarm of bees. Many years ago I was at a friend's house where, having company, the family had built a fire in a room that had not been used for some time, in the chimney of which the swallows had been in the habit of roosting in large numbers. That evening the smoke from the fire disconcerted them, and they kept up a great chattering. At one time several of them went down, but the smoke soon drove them out again. They, however, continued their motion until near dusk, when they all at once descended into the chimney so rapidly, that they filled up the flue entirely, and caused the smoke to come out into the room. The family, not wishing to be outdone, had some shavings brought to make a large blaze, thinking that would certainly drive them out, but as there was no draft up the chimney, the blaze came out into the room and was near setting the mantle on fire, so that they

had to call for water to put the fire out: thus the birds obtained the mastery,

I have known instances where the swallows have descended so rapidly into a chimney where there was fire, as to create a strong downward current of air, which drove the soot and ashes over the hearth and floor of the room. These occasional inconveniences and the litter they make in fire places, is all that can be said against them; but as their entire food is insects, they are certainly beneficial. The whole tribe have short bills and wide mouths, well calculated to take insects while on the wing. Their motions have been considered indicative of the weather; thus, when they fly high, fair weather is predicted, and, when low, rain is expected. The theory of this appears to be that, when the air is dry, as it always is in fair weather, insects fly high, and the birds do so to obtain their food; but when the air is loaded with moisture, as is usual before rain, insects always fly low, and the birds follow them.

Another variety of swallow is the barn swallow, so named from its habit of building in barns and other out-buildings. Their nests are made of clay, or mud, mixed with fine roots, or grass, mostly attached to the rafters of the roof near the top, and are nicely lined with feathers. They keep much on the wing, but are frequently seen perched on the fence or some other place. Their color is dark above and light underneath, and the tail is forked, from the side feathers being much the longest.

We have here, of late years, another variety of swallow, very similar to the barn swallow, but of lighter color on the back, and the tail not forked. Their habits are much the same, but they build a most curious nest. They select a place generally on the side of a large barn, just below the roof or other projection, where a small offset is found, on which they begin to build. They make their nest of soft clay, or mud, and build it up to the overhead projection, and then turn it so that the entrance is pointing downwards. In entering the nest they fly directly up into it, without alighting outside, and immediately turn round with their head at the entrance, and thus can keep intruders at bay. They are very social, as two pairs will often build their nests side by side, and joined together all the way up, but having no communication between them. In building, they act with much judgment; they begin early in the morning and work assiduously till about 9 o'clock, when they all stop, and not an individual is to be seen violating this rule. In the afternoon they work again for a few hours, when all stop together. This gives time for the material to dry and become firm, otherwise it might give way, if too much soft material was added before it became sufficiently solid to bear its own weight. From the fact of their building on large and high barns, as it is

on such that suitable places are usually met with, they have been nick-named the rich man's swallow.

The martens are classed with the swallows and have much the same habits, except that they only build among us in boxes, or houses, prepared for them. They, too, are sociable, and many pairs will build in one house with only partitions between them. They are larger than the swallow, and of nearly a black color on the back, with lighter color underneath; they have more musical notes and are quite noisy around their homes.

We have a very handsome small yellow bird here that is considered, and not without reason, a mischievous little fellow. It feeds in their season on the seeds of the thistle, and other downy-seeded plants, that are readily blown about with the wind.

In the garden the seeds of the lettuce and salisfy, or oyster plant, are his especial favorites. He attacks the seed heads of the latter just before they open, and makes sad havoc with the seed, making it difficult to save any unless the plants are watched. His motions on the wing are singular; by a rapid motion of his wings he rises considerably, and then closing them he descends about as far, when he again ascends by a similar effort, to be followed by a descent as before. This kind of motion in flying is common to the woodpecker family of birds, but none rise and fall as far as this bird. He has the credit of feeding on the aphides that infest the cabbage tribe of plants while going to seed, and thus far is quite a benefactor.

The lark is a bird about as large as our partridge, and does not appear to be as much a bird of passage as some others, being often seen here in winter; they frequent meadows and low grassy grounds, building in tufts of grass, and making their nest of dry grass, cover it over with only an entrance in one side. They lay five or six white eggs, speckled with brown. They are considered a very innocent bird, doing little injury to the farming interest. They mostly roost in meadows in the grass, and may sometimes be seen, when they come over the desired place, to drop down nearly perpendicularly, and almost as rapidly as a falling stone. The English lark is somewhat different from our bird, and is more musical, ours having but few notes. The foreign variety has been sometimes brought to this country, as an addition to our singing birds. They are represented as rising rapidly in their flight early in the morning, singing, at the time, with strong emphasis, and are much admired for their melody. One variety frequents the barn yards of the farmers in winter, in search of grain amongst the straw, and are then considered excellent food, about equal to the partridge.

The partridge is a well known bird, common to nearly every part of our country; they are

heavier in proportion to their size than most other birds, and use their legs more freely, yet they fly with great rapidity, striking quickly with their wings; they are much sought after by epicures and sportsmen. They build their nests, like the lark, in bunches of grass, with an entrance on one side, and lay from fifteen to twenty eggs at a time, thus increasing faster than any other bird of equal size. Their eggs are white and more conical than any other egg I know of. This bird feeds on seeds more than most other birds, and generally on the seeds of weeds; hence they are beneficial to farmers. They are not musical, yet their well known cry of "Bob White," is interesting to every lover of nature. The male bird will mount a fence, a shock of grain, or some such moderate elevation, and pronounce those notes with a loud voice. It often happens that other birds within hearing will answer these notes, each bird repeating them after a few minutes' interval. The young birds are able to run as soon as hatched; indeed, it is said they have been seen to do so with part of the egg-shell sticking to their backs. The parent birds are very assiduous in the care of their young, leading them about like the domestic fowl, and sheltering them under their wings in the same manner; and they are soon able to fly short distances. When danger threatens them, the parent bird gives the alarm, when the young soon scatter and creep under any covering they can find, and being so near the color of the ground, it is difficult to see them, except when in motion. On these occasions, one of the old birds will flutter about with plaintive cries, as if wounded, when the novice, supposing it can be caught, eagerly pursues it; but the bird always escapes him, keeping a little in advance; by this means, enticing him away from its brood. After leading him clear off, the bird will rise and fly away, and, after a time, return to the brood, making a peculiar call, which the young understand, inviting their return, as the danger is over. This peculiarity is shared with many other birds, but the partridge, which takes to its feet soon after hatching, and is constantly on the ground, is more exposed to danger than other birds. They have many enemies among the birds of prey and small animals that feed upon flesh. The black snake will take them whenever he has a chance. Many years ago, as I was passing along a path leading through a field of tall oats, just before they were ripe, my attention was drawn to a motion in the oats a little distance off, that appeared as if a bird was fluttering on the ground; at the same time a plaintive cry was heard as of a bird in distress. As the motion was approaching towards me, I stood still, awaiting the result. In a short time a large black snake was seen gliding through the oats with a young partridge in its mouth. As soon as the snake reached the path, it stopped for a moment and looked at me,

and then resumed its course towards a stone fence not far off. Before it had entirely cleared the path, I stepped forward and caught the reptile firmly by the tail, and drawing it quickly upward above my head and down again, rapidly, for a few times, in a manner similar to a wagoner when he cracks his whip, I succeeded in jerking the reptile's head off. What became of the young bird I never knew, but as it had, probably, been just caught and perhaps not hurt, it may have escaped when I caught the snake. The old bird was following the snake at the distance of 15 or 20 feet, but flew away the moment it saw me. In the winter, these birds frequent the barn yards, wheat stacks, or similar places where grain is to be met with. At such times, the younger members of the family often set traps for them, baited with grain, and frequently catch them for the table. They are excellent eating, particularly for invalids; the flesh is whiter than that of some other birds, nearly resembling that of the young domestic fowl. The young always keep in flocks until the next spring, when pairing time commences. When they chance to become separated, as is sometimes the case when alarmed, they may be heard, after the alarm is over, making a peculiarly plaintive cry, which is answered by the parent, and, in this way, they can find each other again. When pursued by a hawk, or otherwise greatly alarmed, they make a loud scream of distress, and often plunge headlong into the nearest thicket or brush pile for safety, and as they fly very rapidly, they have been known to kill themselves by striking a tree in their flight. Their manner of going to roost is peculiar. The whole flock collect in a suitable place on the ground, where they can fly up readily, and then turning their tails all inward, they can take the wing without interrupting each other.

(To be continued.)

For Friends' Intelligencer.

Review of the Weather, &c., for FIFTH Month.

	1858.	1859.
Rain, during some portion of the		
24 hours,	19 days.	11 days
Rain, all or nearly all day,	5 "	1 "
Cloudy without storms,	4 "	6 "
Ordinary clear,	3 "	13 "
	31	31

TEMPERATURES, &C.

Mean temperature of the month per Pennsylvania Hospital,	59.13 deg.	63.75 deg
Highest do. during month do.	78. "	86. "
Lowest do. do. do. do.	47. "	45. "
Rain during the month,	5:01 in.	2.25 in.

Deaths during the month, counting five current weeks for 1858, and four for 1859, 955 705
 The average of the mean temperatures of this month for the past seventy years has been 62.61 deg., while the highest during that period occurred in 1802, 1826, 71 deg.; and the lowest in 1848, 51.75 deg.

SPRING TEMPERATURES.

Mean temperature of the three Spring months of 1859,	54.26 deg.
Mean temperature of last year, (1858.)	50.27 "
Average of the means of ditto during the past seventy years,	50.73 "
Highest during that entire period, 1826, 55	"
Lowest do. do. 1794—1843, 46	"

From the foregoing it will be seen that the mean temperature of the month under review has exceeded the corresponding one of last year about four and one-half degrees, and the average for the past seventy years more than a degree. The entire spring temperature this year has also been very high, equalling within three-quarters of a degree the very highest mean of the past seventy years.

The aggregate amount of rain that has fallen, up to the close of Fifth month, inclusive, during the years specified below, has been:

1857.	1858.	1859.
18.47 inches,	15.61 inches.	25.17 inches.
Philada., Sixth month, 1859. J. M. E.		

THE ANGELS IN THE HOUSE.

Three pairs of dimpled arms, as white as snow,
Held me in soft embrace ;
Three little cheeks, like velvet peaches soft,
Were placed against my face.

Three tiny pairs of eyes, so clear, so deep,
Looked up in mine this even,
Three pairs of lips kissed me a sweet "good night,"
Three little forms from heaven.

Ab, it is well that "little ones" should love us ;
It lights our faith when dim,
To know that once our blessed Saviour bade them,
Bring "little ones" to him !

And said He not, "Of such is heaven," and blessed them,
And held them to his breast !
Is it not sweet to know that when they leave us,
"Tis there they go to rest ?

And yet, ye tiny angels of my house,
Three hearts encased in mine !
How 'twould be shattered, if the Lord should say,
"Those angels are not thine !"

"A LITTLE WHILE."

JOHN xvi. 18.

O! for the peace that floweth as a river,
Making life's desert-places bloom and smile ;
O for the faith to grasp heaven's bright forever
Amid the shadows of earth's little while."

"A little while" for patient vigil-keeping,
To face the storm, and wrestle with the strong ;
"A little while" to sow the seed with weeping ;
Then, bind the sheaves, and sing the harvest song.

"A little while" to wear the robe of sadness,
To toil, with weary step, through miry ways,
Then, to pour forth the fragrant oil of gladness,
And clasp the girdle round the robe of praise.

"A little while" midst shadow and illusion,
To strive by faith, love's mysteries to spell,
Then, read each dark enigma's bright solution,
Then hail sight's verdict, "He doth all things well."

And He who is himself the gift and giver,
The future glory and the present smile,
With the bright promise of the glad "forever"—
Will light the shadows of this "little while."

Those who recognise the true dignity of labor will be glad to see the subject ably treated in a pamphlet from which we make large extracts for our columns. It is entitled "Women and Work." It is written by an English woman, who evidently feels the importance of the views she advances. All her suggestions may not be adapted to the wants of this country, but the arguments in favor of every woman's receiving an education to fit her for work of some kind, are calculated to carry conviction with them, and to lead to a serious consideration of their justice and truth.—EDS.

WOMEN AND WORK

BY BARBARA LEIGH SMITH BODICHON.

Women want Professions.

Cries are heard on every hand that women are conspiring, that women are discontented, that women are idle, that women are overworked, and that women are out of their sphere. God only knows what is the sphere of any human being.

Again, we hear cries that the world is going wrong for want of women, that moral progress cannot be made without their help; that Science wants their delicate perceptions; that Moral Philosophy wants the light of their peculiar point of view; Political Economy their directness of judgment and sympathy with the commonalty; Government the help of their power of organizing; and Philanthropy, their delicate tact. Hospitals must have them, asserts one; watches must be made by them, cries another; Workhouses, Prisons, Schools, Reformatories, Penitentiaries, Sanitoriums, are going to rack and ruin for want of them; Medicine needs them; the Church calls for them, the Arts and Manufactures invite them.

One great corresponding cry rises from a suffering multitude of women, saying, "We want work."

Women are God's children equally with men. In America and Great Britain this is admitted; because these are Christian countries. In Mahomedan countries this is denied. We admit it as a principle, but we do not admit all that can be deduced from it; in practice we deny what we affirm in theory. If we are God's children, we owe certain duties to him. The life of most women is a practical denial of such duties.

God sent all human beings into the world for the purpose of forwarding, to the utmost of their power, the progress of the world. We must each leave the world a little better than we found it. Consider all the evils in the world; you will see they are such as God has given us power to cure. We could not prevent good if we set about it, but evil we can hinder; it has in it the seeds of death, while all good influences are protected by God.

We are God's tools, by which he will make the world what he intends it to become.

No human being has a right to be idle, no human being must use the earth as a stable, and "eat off his own head." Whatever comes under our hands should be bettered by the touch of our fingers. The land we own we should drain and make more fertile for ever. The children who are in our power should be educated. If a sickness falls upon our town, we must try to stop its progress, and to alleviate the sufferings it occasions. If an old roof lets in the rain, we must new-slate it. If an old pot comes to us to mend, we must mend it as best we can. And we must train ourselves to do our work well. It is a good thing to ask ourselves daily the question, "Have I eaten my head off to-day?" Women must, as children of God, be trained to do some work in the world. Women may not take a man as a god: they must not hold their first duty to be towards any human being.

For our part, when we think of the lives of most women, how they are centered and bound in human affection, living no life but that of love, we cannot wonder that reason goes when love is lost. "Oh! that I had now what you men call the consolations of philosophy," said a woman whose heart was sorely tried. The consolations of philosophy which men have, are indeed great when philosophy means the knowledge of God's works, but not enough unless some branch of the philosophy involves work. The man who works to discover the habits of an insect, or the woman who watches the growth and means of nourishment of a polype—whoever works is consoled. I have a great respect for the young lady, who, being desperately in love, and having to give up her lover, went through the first four books of Euclid that she might not think of him. But I think it must have been heavy work, and that if she had been studying to be an architect, her purpose would have been better answered. It is surprising to see girls study so much as they do, considering how constantly the idea is put before them that they must give it up some day.

We were talking with Dr. Emily Blackwell a little while before she left England to join her sister, Dr. Elizabeth, in New York, as to the possibility of married women continuing in the exercise of professions if they had many children. She said: Granting women want to be doctors, and that medical science has need of women, woman must and will enter the profession. I think it most probable that women will modify the practice of medicine; they will, probably, practise in groups taking different branches; but we can hardly tell what effect the introduction of women may have upon the medical profession. We shall see in time; depend upon it, it will be good.

Queen Victoria fulfils the very arduous duties of her calling, and manages also to be the active

mother of many children. Each woman must so arrange her own life as best to fulfil all her duties. Women can be trusted to do the best for their young children; maternal love is too strong ever to be weakened by any love of a science, art, or profession. As the human being is larger, and nobler, so will the natural affections be larger and nobler too. Let women take their places as citizens in the Commonwealth, and we shall find they will fulfil all their home duties the better.

There are now many trades open to women with good training in bookkeeping, and knowledge of some especial branch of business, not difficult to acquire, if fathers would help their daughters, as they help their sons. Two or three young women together might enter upon most shop-keeping businesses. But very few young women know enough arithmetic to keep accounts correctly.

It is unjust to say sneeringly, "If women want to work, why don't they?" It is not an easy thing for a boy brought up to manhood to expect large fortune, to gain his livelihood if he be suddenly deprived of every farthing he possesses; and much is the pity lavished upon him. Probably friends lend him some hundreds of pounds for him to live upon, while he prepares for some profession. The case of most women who are left destitute is much harder, and there are fewer paths open to them, and these are choke full. We are sick at heart at the cries that have been raised about distressed needle-women, and decayed gentlewomen, and broken-down governesses. Much sympathy has been felt, but little solid thought given to the subject.

There is no way of aiding governesses or needle-women but by opening more ways of gaining livelihoods for women. It is the most efficacious way of preventing prostitution. "At present the language practically held by modern society to destitute women may be resolved into Marry—Stitch—Die—or do worse."

Apprentice 10,000 to watchmakers; train 10,000 for teachers for the young; make 10,000 good accountants; put 10,000 more to be nurses under deaconesses trained by Florence Nightingale; put some thousands in the electric telegraph offices over all the country; educate 1,000 lecturers for mechanics' institutions; 1,000 readers to read the best books to the working people; train up 10,000 to manage washing-machines, sewing-machines, &c. Then the distressed needle-woman would vanish; the decayed gentlewomen and broken-down governesses would not longer exist.

In the United States the want of a professional training for women is almost as much felt as in England. The greater ease in gaining a livelihood prevents the same amount of absolute suffering which we see among women in the old country.

Teachers receive much better pay, and many ladies I have met in America have told me they have been able to save enough in a few years to live upon for the rest of their lives. * *

But all these teachers do not teach well, or teach because it is the profession they like best; they are teachers because, in America as in England, teaching is almost the only means of gaining bread, open to women. In the mint in Philadelphia, I saw 20 or 30 young ladies who received half, sometimes less than half, the wages given to men for the same work. They were working ten hours a day for a dollar (4s. English). This proportion shows the lamentable amount of competition among women, even in the United States, for any work which is open to them.

In no country have I been so much struck by the utter idleness of the lady class, except, perhaps, in the East, among the Turks and Moors. There is in America, a large class of ladies who do absolutely nothing. In every large town in the United States, there are five or six (in some places 20 or more) large hotels or boarding houses containing several hundred inhabitants each. This hotel population mainly consists of families who live altogether in hotels, and the ladies having no housekeeping whatever to do, have few of the usual duties of women in Europe, and are more thoroughly given up to idleness and vanity than any other women I believe, in the world. These "ladies" have not the cultivation which glosses over the lives of so many women in Europe, and does give them some solid value in society as upholders of the arts and literature, but are generally very ignorant and full of the strangest affectations and pretensions. * *

At this present time, I believe there is in America as strong a public opinion against women working for a livelihood as in England. No father in a "respectable class" thinks of giving his daughter a professional education. If he can live in some "style," he counts on his daughters marrying, and if he cannot, he probably sends them to some relative in a city, who receives them for a long visit, with the hope of "getting them off." Many thousands of young girls come to the cities to stay with brothers, uncles, or friends for this purpose. A worse preparation for any serious life cannot be conceived. Years of idleness are often passed in this way, years spent in nothing but dressing and dissipation—and what does it lead to? Marriage probably: but what sort of marriage can be formed by young girls looking at the world from such a false position? With such a beginning to life it is almost impossible the girl can ever become a noble human being, a good and wise woman. When she ceases to be a young girl, she will be an "old girl," and never a woman. The great privilege which every human being ought to have of perfect freedom of choice,

is rendered impossible, and a happy marriage can be but a rare accident.

Unless a woman can earn her own livelihood, or has a certain income, she has little chance of forming an equal union.

In America—in that noble, free, new country, it is grievous to see the old, false, snobbish ideas of "respectability" eating at the heart of society, making generations of women idle and corrupt, and retarding the onward progress of the great Republic.

Men of position and reliable sources of information have assured me that when in any State in America a majority of women shall claim the suffrage, it will be granted them. There are other signs which we have not space to allude to here. The importance of giving women a means of livelihood, independent of marriage, is discussed by the press. And the necessity of greater activity among women is urged vehemently by the newspapers, who believe the health of the mothers of men, and ergo, of men, is deteriorating in America in consequence of the extreme idleness and luxury in which the ladies live.

A great proportion of American women live indoors and do nothing; the others, again, live indoors and do too much. There are many thousands who have to do household work, bear, and nurse children, cook and wash, and live continually indoors, often in badly built, undrained, unhealthy wooden houses, and suffer terribly. The beginning of civilization falls hard on American women. As a pendant to this, side by side, may be seen a sister, living in the midst of luxuries, which many an English lady of rank would refuse as superfluous.

There is always hope of change in America: evils do not go on for ever dragging their slow length as in England. A crying evil exists and is a scandal to the world, when suddenly the young giant rouses up and with a mighty heave shakes it off. The ideas of human liberty and justice are too widely spread in America for any state of things in direct opposition to these principles, to endure for ever. We believe Europe will never move forward on this question until America goes ahead and clears the way.

It is only fathers and mothers who have the power to effect this change. Remember the next generation is ours to form and model as we will. If all fathers and mothers were faithfully to discharge their duties to their daughters, the next generation would see women healthier, happier, and more beautiful than women have ever yet been.

Work—not drudgery, but work—is the great beautifier. Activity of brain, heart, and limb, gives health and beauty, and makes women fit to be the mothers of children. A listless, idle, empty-brained, empty-hearted, woman, has no right to bear children.

To think a woman is more feminine because she is frivolous, ignorant, weak, and sickly, is ab-

surd; the larger-natured a woman is, the more decidedly feminine she will be; the stronger she is, the more strongly feminine. You do not call a lioness unfeminine, though she is different in size and strength from the domestic cat, or mouse.

If men think they shall lose anything charming by not having ignorant, dependent women about them, they are quite wrong. The vivacity of women will not be injured by their serious work. None play so heartily as those who work heartily. The playfulness of women which makes them so sympathetic to children, is deep in their natures; and greater development of their whole natures will only increase this and all their natural gifts.

It is often said, it is wrong of daughters to leave their parents in order to follow this or that pursuit. Mothers and fathers say nothing, if their daughters leave them to be married. It is much more important to the welfare of the girl's soul that she be trained to work, than that she marry. It is very hard for children to battle against this feeling in mothers and fathers, even when they feel it most unreasonable. Generally, daughters have neither the courage to choose work, nor the resignation to submit with cheerfulness to be children all their days. Oh, girls, who are now suffering in this battle, remember your sufferings when you have children, and do unto them as you would you had been done unto!

Far be it from us to say that children do not owe deeds of reverence and duty to their parents—they do, most certainly. All that ennobles women will make them discharge these more faithfully. But for two or three daughters to remain at home idle, with the pretence of attending on a father or mother, who is not even always old, infirm, or ill, is absurd. The pretence breaks down as soon as a "good match" offers. There are, moreover, many professions, such as medicine, many branches of decorative art, wood-cutting, engraving, watchmaking, &c., &c., which, after some time of apprenticeship, can be carried on at home. The alteration of the laws concerning married women's property will make a great difference in the public feeling as regards women working after marriage. The 60,000 women who have signed petitions for the alteration of the law, and which alteration will give them a right to their own earnings after marriage, have quite settled the question as to whether women want to earn money or not. Women *do* want work, and girls must be trained for professions.

(To be continued.)

A good conscience and a contented mind will make a man happy in all conditions.

True religion will show its influence in every part of our conduct; it is like the sap of a living tree, which penetrates to the most distant boughs.

FOREIGN POST-OFFICES AND OUR OWN.

Our Post-Office Department does not pay its own expenses, in spite of all the pains taken to make it do so. In this respect it resembles those of continental Europe, but falls short of the English system. Below we give the population, postal revenue and expenses, and number of letters mailed in the countries which have the most postal business:

	Population.	Postal revenue.	Postal expenses.
Switzerland,	2,292,748	\$447,752	\$340,028
Holland,	3,056,591	288,162	156,785
Belgium,	4,426,202	355,648	327,128
Spain,	13,296,218	1,281,761	1,095,398
France,	35,783,170	9,321,900	6,023,915
United States,	23,191,876	5,940,724	7,982,757
Great Britain,	27,833,501	12,872,039	7,003,399

	No. of letters.	Letters per 1000 persons.
Switzerland,	19,773,671	8,299
Holland,	13,349,553	4,387
Belgium,	11,521,955	2,603
Spain,	30,775,686	2,202
France,	150,000,000	4,194
United States,	102,139,148	4,409
Great Britain,	410,817,489	14,760

We are so apt to pride ourselves on the diffusion of popular education in America, and to contrast our own intelligence with "millions unable to read or write" in Europe, that it will surprise many to find that a far less number of letters are written in the United States than in Great Britain, and only about as many, in proportion to the number of inhabitants, as are written in slow, phlegmatic Holland, and in closely-watched, despotic France. Spain and Belgium we beat, of course, for popular education is neglected in them; but free and busy Switzerland beats us out of sight in the matter of correspondence.

One great reason for the discrepancy existing between our Post Office and that of Great Britain, is the superior management of the latter in respect to delivery of letters. The Post Office there, like the Express Company here, does not consider its task accomplished until it has placed the package entrusted to it in the hands of the person to whom it is directed. A letter does not lie in the office waiting to be called for, but is carried directly to the man's office or lodgings and given to him. One thing gained by this is certainty. It greatly stimulates correspondence to know that a letter will infallibly reach its destination. Another thing is rapidity, which stimulates it still more. A couple of business men living in the same city, or in neighboring cities, in England, will exchange half a dozen letters while a couple of men here are sending and receiving an answer to one.—*Albany Journal*.

We need not travel, seeking ways to bliss,
 He that desires contentment cannot miss;
 No garden-walls this precious flower embrace,
 It common grows in every desert place.

ITEMS OF NEWS.

The first battle has been fought between the allied armies and the Austrians, in which the latter have been defeated. The battle was fought on the 21st ult. at Montebello, between 15,000 Austrians, under Gen. Stadion, on the one side, and 6,000 or 7,000 French and a regiment of Sardinian cavalry, under Gen. Forey, on the other. The battle continued during four hours, when the Austrians retreated behind the Po, leaving, it is reported, 1,500 or 2,000 dead upon the field. The French loss is said to be between 600 and 700, including many officers. A number of Austrians were taken prisoners, and had been forwarded to Marseilles. The King of Naples is dead, and his successor, Francis 2d, occupies the throne. There are reports of differences between Lord Palmerston and Lord John Russell, and the defeat of the Derby ministry at an early day is predicted. A later steamer brings the intelligence that the Austrians were retreating before General Garibaldi, who had advanced from Varese to Como.

THE LOCUSTS.—H. D. Whitcomb, Chief Engineer of the Central Railroad, informs us that the western slope of the Blue Ridge is now covered with millions of locusts. They appeared first near the top of the mountain, about two weeks ago, and seem to be moving in a westerly direction. It will be recollected that Dr. Smith of Baltimore predicted the appearance of these insects in the valley during this month. None have yet been seen in the vicinity of Staunton.—*Staunton (Va.) Spectator.*

THE SMYRNA TIMES SAYS:—"It is now apparent, as the season advances, that the peach crop has not been injured as much as was at first anticipated. In some localities the crop has been benefited rather than injured by the frosts, for if all the fruit had remained on the trees and come to perfection, it must have been inferior, if, indeed, the trees could have sustained the great weight. This has been the case in Cecil County, Maryland, particularly, and, in fact, on the most of the entire of the Eastern Shore. We are inclined to think that the orchards bordering on the Delaware river and bay have sustained the greatest injuries. In this section the early varieties were severely hurt, in some orchards nearly all destroyed: but there will be a fair yield of the other varieties, which will no doubt handsomely remunerate the growers."

DISASTROUS FLOOD IN THE UPPER MISSISSIPPI.—The St. Paul papers of 4th and 5th inst. say that city and other towns above and below have suffered seriously from a flood in the Upper Mississippi. Much damage had been done to property in the warehouses.

The levee at St. Paul, and Brooklyn, opposite St. Paul, was entirely submerged, and the inhabitants were compelled to abandon their dwellings on account of their general inundation.

At St. Anthony the damage to property was immense. Several hundred thousand feet of logs belonging to the saw mills along the river had been swept away. The mills were greatly damaged. The upper bridge, which cost \$20,000, was swept away, and the lower bridge, built at an expense of \$60,000, was very much damaged.

Reports from various quarters along the Upper Mississippi state that nearly all the bridges across the stream have gone.

The river is higher than it has been for a number of years.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Flour is firm. Receipts of Flour continue light, and holders are generally firm. At Pittsburg, prices are relatively higher than here, and 1000 bbls. extra were taken for shipment there. Sales of good superfine are reported at 7 25, common extra

at \$7 00, and good Western extra at \$7 50. The sales to the home trade are limited between \$7 00 and \$8 50 for fancy lots. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 50, and the latter at \$4 per barrel.

GRAIN.—Wheat is in demand and improving. Sales of Pennsylvania and Western red at \$1 65 a 1 70, and white at \$1 80 a 1 85. Rye is selling at 90 c. Corn is firm, but comes in slowly. Sales of yellow at 90 cts., afloat. Oats are in fair demand. Sales of prime Pennsylvania at 50 cents. A sale of 2500 bushels of Buckwheat at \$1 50.

COVERSEED comes forward slowly, and prime lots are in demand at \$5 50 a 5 75 per 64 lbs. No change in Timothy or Flaxseed. The former is worth \$1 87½ a \$2, and the latter \$1 70 a 1 72 per bushel.

A well qualified teacher is wanted to take charge of Darby Monthly Meeting School. Application can be made for further information to

RACHEL T. JACKSON or
M. FISHER LONGSTRETH

6th mo. 1st, 1859.

Darby P. O. Penn.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, &c. Pells work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Atleboro', Bucks Co., 5th mo., 28, 1859.

6m.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address

WM. HICKLEN,

Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,

Cheap School Book Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

Merrilow & Thompson, Prs. Lodge street, north side Penna. Bank

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SIXTH MONTH 25, 1859.

No. 15.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

On the Divine Being.

James. Since our last interview, brother John and I have been conversing on the attributes of the Divine Being, and his manifestations to the children of men in different ages of the world. He appears to think there is something so mysterious in the subject, that we ought to believe without understanding it; but I am opposed to every thing like implicit belief: and as different doctrines are taught among men, I cannot believe any of them, until the subject shall become clear to my own understanding.

John. Here is the difference between brother James and myself: he is determined to measure every thing by his own finite understanding, even the three-fold existence of the infinite God; but I do not feel at liberty to doubt any thing that appears to be clearly recorded in the holy scriptures, although it may be beyond my limited comprehension: for I find, that even in the works of creation, there are many things that I do not understand, yet it is impossible to doubt them. For instance, I know there is an intimate connexion between the soul and body, and yet I cannot understand how they are united, nor how a material body can be acted on by an immaterial soul. We cannot understand *how* the simplest operations in nature take place. For example, the growth of grass is a fact that we all acknowledge, but we do not understand how it takes place. I therefore conclude, that it would be a piece of great folly in me to attempt to understand the mystery of three persons in the Godhead; for if the scriptures assures us of the act, I ask no further evidence.

Father. I am willing to explain to you my views upon the subject, and I wish you to state all the objections that may occur to you; for it is my desire that we may all be seekers of truth, and not the champions of a party. Before I proceed to state my views upon the main question, I must make a few remarks upon the subject of belief.

It appears to me, that belief does not depend entirely upon our own will; for we often hear things asserted, that we could not believe if we were to try. If a man who was really very sick, was told by his physician that he was not sick, and that he might get up and walk, it is very certain that the sick man would not believe him, although he might wish it were in his power to believe.

Belief depends upon the weight of evidence presented before the mind, and upon our having a *clear perception* of that evidence. If the mind be clouded by the prejudices of education, or biassed by interest, it will not always *perceive* the evidence *on both sides*, that may be presented to it; which is a fact that may be illustrated by our outward vision: for when a great number of objects are presented before us at the same time, the eye will naturally rest upon those objects which are *most agreeable to us*, and will sometimes overlook other objects, so as not to perceive them at all. We therefore make up our opinions according to the evidence that we *perceive*; and if we perceive only a part of the evidence, we may be *irresistibly* led to form an erroneous opinion. But if, at any time afterwards, we come to *perceive* the *remaining* evidence, we shall then be obliged to change this opinion. Therefore, I do not condemn any man for entertaining opinions different from my own; for I conclude that one or the other of us has not seen the subject in all its bearings; and I feel assured, that if we are both faithful to *put in practice* all that we do *know to be good*, the Divine Being will not leave us without sufficient light to guide our steps in the way that leads to eternal peace.

There are many facts which we cannot explain, and yet we are obliged to believe them, because the evidence of their existence is so plain as to leave no room for doubt. In this case, it is the *fact* that is the object of our belief, and not the *manner* or *process* by which the fact has been produced; for if this *process* be hidden from us,

it cannot be an object of belief. For instance, in the cases mentioned by John; the union of the soul and body, and the action of the soul upon the body, are facts which I cannot doubt; but the manner in which they are united, and the principle by which the soul acts upon the body, are hidden from me, and consequently this manner and this principle are not the objects of my belief. That the grass grows is a fact for which I have the evidence of my senses; but so far as I cannot perceive the process by which it grows, this process is not an object of my belief. The human mind is so constituted that we cannot believe without sufficient evidence; nor can we believe any proposition that contains in itself a contradiction or an absurdity: for no evidence can prove a thing that contradicts itself. For instances, if a person were to say that a part of any given thing is as large as the whole of it: here is a contradiction that no authority whatever could make me believe. Compulsion may make hypocrites, but it never can make believers. It is related of Socrates, that when he was asked his opinion of some writings that were very obscure, he replied that he approved of those parts which he understood, and he therefore concluded that the parts which he did not understand were equally good. This is the conclusion I have formed with regard to the scriptures; and therefore I am far from rejecting any passage which I do not understand; for I apprehend there may be truths contained in such passages, which, in a more advanced stage of experience, will become clear to my mind.

James. This explanation is satisfactory to me; but I believe it is very common for men to withdraw their attention from that kind of evidence which does not accord with their prejudices and passions; and this is a species of wilful neglect, for which we shall certainly be held accountable. The term mystery, which is so often used by religious teachers in order to extricate themselves from the absurdities of their own doctrines, has been perverted from its original meaning. A mystery among the ancients, was not a doctrine supposed to be incomprehensible in itself; but it was something that was hidden, or withheld from the public, and only revealed to a favored few; and therefore, when it was revealed to any one, it was no longer a mystery to him.

Father. There are two kinds of mysteries mentioned in the scriptures. The first is that kind to which Christ alludes, when he says to his disciples, "It is given to you to know the mysteries of the kingdom of heaven, but to them it is not given." Mat. xiii. 11. These mysteries are not revealed through the wisdom or learning of man; for he says, "I thank thee, O Father Lord of heaven and earth, that thou hast hid these things from the wise and prudent, and hast revealed them unto babes: even so Father, for so it seemed good in thy sight." Luke x. 21. "Even

the mystery," says the apostle, "which hath been hid from ages and from generations, but now is made manifest to his saints; to whom God would make known what is the riches of the glory of this mystery among the gentiles; which is, Christ in you, the hope of glory." Col. i. 26, 27.

From these passages it appears, that the mysteries of the kingdom of God are only revealed to the children of the kingdom, who are the meek, the humbled, the teachable, as babes; and they are hidden from the wise and prudent of this world; that is, from those who attempt to understand them by the wisdom and learning of man, without coming to the experimental knowledge of the truth. There is, however, another kind of mystery, called the "mystery of iniquity," which the apostle Paul said had begun to work, even in his day, and should be more fully revealed in "the man of sin and son of perdition," who "opposes and exalts himself above all that is called God, or that is worshipped; so that he as God sitteth in the temple of God, showing himself that he is God." 2 Thes. ii. 3-7. This is the same kind of mystery which the apostle John alludes to in the Revelations; for he describes the apostate church as "a woman sitting upon a scarlet colored beast, full of names of blasphemy; and upon her forehead was a name written *Mystery, Babylon the great.*" It appears that the apostle Paul forewarned the church of Colosse against the particular snare that would cause its "falling away;" for he says, "As ye have therefore received Christ Jesus the Lord, so walk ye in him, rooted and built up in him, and established in the faith, as ye have been taught, abounding therein with thanksgiving. Beware lest any man spoil you through philosophy and vain deceit, after the traditions of men, after the rudiments of the world, and not after Christ; for in him dwelleth all the fulness of the Godhead bodily." Col. ii. 6-9.

(To be continued.)

A Memorial of Shappauga Monthly Meeting, concerning our beloved friend, JACOB L. MOTT, deceased.

Feeling deeply sensible of the great loss we have sustained in the removal, by death, of this our beloved friend, and believing the remembrance of those who have been examples of faithfulness to manifested duty, has a tendency to strengthen and encourage others to "walk by the same rule and mind the same thing," we feel it right to prepare a memorial concerning him, fully believing he has received an entrance into that heavenly kingdom which is the reward of the righteous.

He was born in the city of New York, on the 13th of 9th month, 1784. His parents were Jacob and Deborah La Mott, the latter a worthy member of our Society, who was much concerned for her children, and it is believed her example

and care had a good effect upon our deceased friend.

Although not addicted to gross evils, he was prone to levity and mirth; and his testimony is remembered, that when returning home from such pastimes, the convictions of truth on his mind were so strong, that tears of contrition have fallen from his eyes, as he passed through the streets of the city, when little was to be heard but the watchman at his post. Early in life submitting to these visitations of his Heavenly Father's love, he was drawn to attend the meetings of Friends; and he writes of himself, as a brand plucked from the burning, and a monument of the mercy of God.

He was married the 6th of 8th month, 1806, to Hanah Riker, with whom he lived in great harmony and mutual affection for fifty years. It may be truly said of him, he was an affectionate husband, a tender parent, and a kind neighbor, being cheerful in his deportment, and upright in his dealings among men; he was much beloved by those who knew him.

He was received a member of New York Monthly Meeting, at his own request, in the 4th month, 1807, being in the 23d year of his age.

It appears to have been his practice to commit to writing some of the exercises of his mind, on various subjects, and we believe nothing can describe him more pertinently than some extracts from them.

After taking the responsibilities of a family, and entering into business, he says: "I had many close trials, besetments, and temptations, in which my religious faith was closely tried. I now see very clearly that many, or at least some of the difficulties and troubles that I have experienced might have been avoided, had I always attended to the revelations of the spirit in my younger years; they were brought about by my unfaithfulness; I wandered from my inward Guide, and was almost forgetful of the day of my espousal. But blessed be Israel's God; thanksgiving and praise be ascribed unto him, although I wandered from the fold and went into the wilderness, he followed me, and kept close to me, and, giving me strength to resist temptation, preserved me from falling into the hands of the enemy, and thus renewed my faith, enabling me to bear up the testimonies of our Society. Although a part of the time I resided out of the city, I seldom missed attending a meeting, notwithstanding I had to row a boat ten miles to get there, and sometimes returned the same day."

In the summer of 1814 he settled within the compass of this Monthly Meeting, and became a member of it, by certificate, and when health permitted, was diligent in attending meeting, although living nearly ten miles from it. In recording the faithfulness and perseverance of our dear friend in this particular, we desire not to eulogize him, but to stimulate others to press

through difficulties in the performance of this reasonable duty.

Having experienced the benefit resulting from an early dedication to the service of his Divine Master, he was often deeply concerned for the welfare of others, and sometimes in meetings it seemed right for him to express it; but feeling that the call and qualification for the solemn work of the ministry are of God, he put it off from time to time, until about the thirty-first year of his age, when, in a public meeting at Shappaqua, he appeared in supplication for the preservation of himself and the assembly, under the weight of which he was deeply humbled, keeping in view the testimony of our Holy Pattern, "my doctrine is not mine, but his that sent me." His communications were sound and edifying. He experienced the sustaining hand of Almighty Goodness to be as a wall of defence around about him, preserving him in the faith, for which he was concerned earnestly to contend. His ministry was acknowledged, and he was recommended as a member of the Meeting of ministers and elders in 1830." "This," he says, "again increased my responsibility, as now I was at liberty, if I felt a concern to visit Friends of other meetings, to open it to the Monthly Meeting." Feeling himself a monument of mercy, raised up in order to proclaim the goodness and mercy of God, he endeavored to stir up the pure mind in others, by testifying of his grace, the word nigh in the heart, and in the mouth. He was frequently concerned to visit meetings, in our own and neighboring Yearly Meetings, we believe to the satisfaction of his friends, and it is evident he realized the truth of his own language, "that the Good Master never sends his servants out in their own strength, but amply supplies wisdom out of his inexhaustible treasury."

He was zealous for the maintenance of good order and the right administration of our discipline, being deeply concerned for the prosperity of our Society.

Earnest and affectionate were his appeals to the rising generation, to come forward in faithfulness to the requisitions of their Heavenly Father.

"On you," he writes, "must depend the future prosperity and character of our Society. If you are faithful, some of you, ere long, will be called to fill prominent stations in the militant church. It is therefore peculiarly necessary that you should be established in the great principles of the Christian religion, in which is involved your own welfare, and that of your fellow men, who at times may be adopting the language 'who shall show us any good?' If you examine history, you will find in all ages it has been those who have been faithful to the light of Christ within, that have been made instruments in the hand of God, in gathering to the church. Be faithful in the little, and you shall be made ru-

lers over more, and, under the guidance of the good and Heavenly Pilot, you will be enabled to avoid those rocks, quicksands, and shoals upon which many have been shipwrecked."

He was concerned that the young should be convinced that there was no gloom in religion. "I would hold it up," he says, "as that which is so lovely in itself as to make it attractive and inviting, as something which will enable us to overcome every besetting sin, and elevate our condition step by step in the scale of improvement, until we become united with the inhabitants of that city which needs not the light of the sun nor of the moon to shine in it, 'for the glory of God doth enlighten it, and the Lamb is the light thereof.'"

He was exercised in regard to a disposition in some to pervert the scriptures of truth, and concerned that a right estimate should be set upon them. His testimony left in writing is, "As we attend to the same principle which inspired holy men of old, who wrote them, our understanding will be opened, and we shall see a beauty and excellency in them which we cannot find by perverting them; we shall not be undervaluing nor overrating them; we shall consider them as testimonies corroborative of those spiritual truths which are sealed on our minds by the impress of the Divine Spirit."

He was frequently invited to attend funerals of those not in membership with us, and being concerned to improve every right opening, and to fulfil what he believed to be his mission to his fellow men, he frequently found it his duty to go, often travelling many miles to accomplish it. Although he often felt the weakness and infirmities of the flesh to be many, and the conflicts of the spirit to be great, yet, at times, he could feelingly rejoice that an interest was mercifully granted through Him "who giveth the victory over all, and that the Lamb Immaculate is still redeeming out of every nation, tongue, and people," and adding to his Church Triumphant those whose names shall be recorded in the book of life, because they submitted to His government.

Some time previous to his last illness he wrote as follows: "There are many sudden removals, and I am often unwell; if I should be suddenly taken away, I have wished that my family might know the comfortable feelings my mind partakes of. Oh! how I am filled with the goodness of God to overflowing, so as to raise the sensation of Holy! Holy! Holy! Hallelujah to Israel's Shepherd! Oh! glorious state! Oh! blessed abode! When, oh! when shall I be there?—These feelings bring with them a complete surrender of all selfishness. All centres in the Divine Will. Whatever the attachment to the world, however strong the family ties, the love of the Heavenly Father absorbs them all. His will is bowed to in humble submission of soul, and the

acknowledgement is, Thou knowest best what to bestow or what to withhold. Thy will be done."

The tender, affectionate solicitude he felt for his children is made manifest by the following, which was written in the 60th year of his age:

"It is the desire of your father that you attend to the impressions of the Spirit of God, made upon your minds from time to time. Be assured as you attend to these impressions you will become more and more acquainted with the teachings of the grace of God, that brings salvation from sin, and the desilements of the human heart. I most tenderly solicit you, as a dear father, to yield to its teachings. Be not ashamed to acknowledge yourselves under its government, although it will lead you out of the world's customs, because it stands in opposition to the spirit of the world—it is to prepare the immortal soul to dwell in the courts of heaven, through an endless eternity; and not only to prepare for enjoyment beyond the grave, but to qualify you to live as you ought, while here on earth. It will enable you to love one another, to do good to all men, to be kind to all placed under your care, and increase your desire for the relief of the oppressed. It will increase your love for religious meetings; you will not be ashamed to wear a plain dress; you will be willing to follow the example of the Son of God.

"If you reject the religion which God reveals in the heart, by the teachings of His Spirit, you never can obtain any but that which is the work of the systems of men. These can rise no higher than their fountain, but the teachings of the grace of God will lead to God. Attend to it, and it will lead you from many sorrows. Be not deceived. Happiness does not consist in the abundance of the possessions of the things of this world. Therefore, be more concerned to live a life of dedication to your Divine Master, than to get riches. Oh! attend strictly to the injunction, 'Seek first the kingdom of God and his righteousness, and all these things shall be added unto you.' Confiding in this promise, and putting your trust in the Lord, blessings will descend upon your labors. He who blessed Jacob and Joseph, will most assuredly bless you."

His last illness was lingering, but he manifested much patience and resignation throughout, being clothed with love and good will to all.

Under date 4th month 27th, 1856, he addressed his family in writing, as follows:

"When I was first taken sick, I thought it might be my last sickness. I have given the subject a very careful investigation, and believe an entrance will be mercifully granted me, into that City described as 'having walls of salvation, and whose gates are praise.' I discover nothing in my way. He who is all wisdom, is also all power. If He has a work for me to perform, He will raise me up for the performance of it, for He knows I am ready and willing. I discover nothing

worth living for, but to glorify His blessed name. If I am taken away suddenly, do not harbor the idea that it was in an unexpected moment, for I have been, and am watching the time as if it were at hand. You have manifested the greatest kindness towards me; you have done all in your power to make me comfortable; for which I trust you will be rewarded. When the time of separation comes, resign me cheerfully, submit to the dispensation as ordered of God, who does all things in his inscrutable wisdom for good." He requested that the testimony to plainness and simplicity should be carried out in his person, even to the grave; that his coffin should be the natural color of the wood, and not varnished, and that no stone or monument should be placed at his grave.

In a letter to a friend, dated 5th month 7th, 1856, he says, "If any Friends ask concerning me, inform them I hold the truth as professed by Friends as dear as ever; that my desires and prayers ascend for its increase, that it may grow bright through us, as a professing people, and it will shine more and more as we mind the light."

On one of his friends taking leave of him, he said, "Be faithful to the requirings of thy Heavenly Father, for at such a time as this it will afford more peace than all else beside." Being visited by his numerous friends, he continued to bear similar testimonies, while able to write or converse, giving evidence to the last that Divine Goodness was his support.

The last three weeks of his life he was nearly deprived of speech by paralysis, yet his last words were, "peace, peace, sweet peace, ready, waiting," evincing the truth of the declaration, "Blessed is that servant whom, when his Lord cometh, is found ready and waiting."

He died the 28th of 8th month, 1856, in the 72nd year of his age, and we feel an assurance that his immortal spirit is centered in that glorified state, of which he had a foretaste, when he could ascribe hallelujah to Israel's God.

His remains were taken to the Meeting House at Shappaqua, and interred, after a large and solemn meeting, in which several testimonies were borne to his circumspect life, and dedication to his Master's cause; and the feeling that we had lost a beloved friend and father in the church, seemed to pervade every mind.

Signed by direction of Shappaqua Monthly Meeting, held in New Castle, 8th of 1st month, 1857.

JOB R. CARPENTER, } Clerks.
RACHEL M. PIERCE, }

As every degree of hatred, envy or contempt, entertained in the mind, must unavoidably cut off its communication with Divine good; surely no one in *that* state can be the instrument or channel of conveying it to another.

The Epistle from the Yearly Meeting, held in London, by Adjournments, from the 11th of the Sixth Month, 1753, to the 16th of the same, inclusive.

To the Quarterly and Monthly Meetings of Friends and Brethren, in Great Britain, Ireland, and elsewhere.

Dear beloved Friends and Brethren:— Under a renewed sense and comfortable experience of the gracious and refreshing influences of that divine and heavenly principle of light and life, wherein the members of the true Church or body of Christ, however dispersed here on earth, stand joined and cemented in the unity of the Spirit, through faith and obedience unto Him their holy Head, guide and leader into all Truth, we most tenderly and affectionately salute you.

It behoveth us, in the depth of humility and reverence, to consider and remind one another of the merciful dealings of the Lord our God, who, in the aboundings of his grace, hath called us out of this present evil world, to bear among the children of men a public profession of our faith in, and subjection to, the light and Spirit of His Son, our Saviour, inwardly revealed: an holy and honorable calling! Let us, we beseech you, brethren, walk worthy of the vocation wherewith we are called: as obedient children, not fashioning ourselves according to the former lusts in our ignorance, but as He that hath called us is holy, so let us be holy in all manner of conversation.

The various affairs and concerns of the churches, which have been laid before this our assembly, have been considered, and concluded in a spirit of brotherly love and Christian condescension, in the exercise whereof, through the prevailing power and efficacy of pure love, every thing centers in an agreeable calmness and serenity.

By accounts brought from the several Quarterly Meetings in England, and by Epistles from Wales, North Britain, Ireland, Holland, Rhode Island for New England, Pennsylvania and New Jersey, New York, Virginia, Maryland, North Carolina, and Tortola, we understand that there is in many places an openness to hear the testimony of Truth, and that many are convinced of our principles, so as to join with us in the public profession of the same. Our earnest desire and necessary caution is, that we may conduct ourselves with the utmost care and circumspection, that no offence or occasion of stumbling be given to sensible enquirers, but that our light may so shine before men, that they may see our good works, and glorify our Father which is in Heaven.

The amount of Friends' sufferings brought in this year from England and Wales, being principally for tithes and those called church-rates, is three thousand and thirty pounds and

upwards, and of those from Ireland, one thousand five hundred and ninety one pounds and upwards. The two Friends formerly mentioned, who have been long imprisoned on excommunications, still remain sufferers under the oppression of the Ecclesiastical Courts; from the unnecessary severity of which, many faithful subjects of this Protestant Government continue to hope for deliverance. There are also two other Friends in prison, where they have been near four years, by Exchequer process for tithes; against which Antichristian yoke of bondage, we earnestly advise you to stand fast in that liberty wherewith Christ hath made you free, and to maintain your testimony in this respect with that fortitude and meekness, which ever accompany and support faithful and conscientious sufferers, in such a righteous and Christian cause.

Dear Friends, it is a matter of exceeding grief and concern to many of the faithful among us, to observe, how far that exemplary plainness of habit, speech, and deportment, which distinguished our fore-fathers, and for which they patiently underwent the reproach and contradiction of sinners, are now departed from by too many under our name, and who frequent our religious assemblies. A declension from the simplicity of Truth herein hath been, and we fear is, attended with pernicious consequences, in opening the way of some, the more easily and unobserved to attend the places of public resort for the exercise of sports, plays, and other hurtful and destructive diversions of the age, from which Truth taught our faithful Elders, and still teaches us, wholly to refrain; and indeed the Christian gravity of their lives and actions always carried with it a severe reproof and manifest opposition to the wantonness and levity of such dangerous and sinful pastimes. Wherefore we beseech you, be not deceived, nor led aside by false notions of imaginary pleasures, to partake with the unfruitful works of darkness, but watch and be sober; and, as becometh children of the light and of the day, abstain from all appearance of evil.

It is with a degree of comfort and satisfaction that we observe in divers places a commendable zeal and fervency in some, to cleanse the Church from pollutions, to restore the discipline thereof where decayed or disused, to assist and bring back the scattered and dispersed of the flock, and to recover those who have gone astray and declined from the testimony of Truth, and footsteps of the faithful; of which declension too many instances appear among us: we cannot but earnestly desire, that the truly concerned in a work of so great importance may meet with a reception answerable to the charity of their endeavors therein. Wherefore, we entreat Friends in their several and respective Monthly Meetings, to assist and encourage such of their members as they apprehend to be rightly concerned in,

and gifted and qualified for, so useful and eminent a service.

And, dear Friends, although the labors of such as are called forth by the Spirit of Christ, and instructed thereby rightly to divide the word of Truth, are highly serviceable in the Church, and the feet of those who publish the glad tidings of salvation exceeding beautiful; yet the aim and design of every true gospel minister is, to direct the minds of all to the divine teachings of the Holy Spirit, and to wait upon, and have their whole trust and expectation upon the Lord alone. And as the religious strength and communion of both preachers and hearers consisteth in their united dependence on the power and spirit of Christ, their guide and leader; so where any part of that dependence is broken off from him, the Holy Head, and placed on any instrument or member of the body, it hath been sometimes experienced to become a weight or burden on such instrument, and a real impediment to its present service. Wherefore, brethren, we beseech you, that in all your assemblies for the worship of God, your eye be single unto Him, your expectation fixed on him alone, and your faith standing in His power and spirit, that you may grow and be established therein and may be made one another's strength in the Lord.

We also esteem it our duty to remind Friends every where, that they be careful and exact in performing their contracts, words and promises; that so the reputation and credit of our Society, which our worthy elders obtained amongst men, by their great care and circumspection in those respects, may be continued. To which end we advise you, as we have often done, to avoid an inordinate pursuit after riches, and not to launch into trade or business above your abilities, so as to subject the honor of your religious profession to the uncertainty of worldly contingencies. But be ye frugal and industrious, ever mindful of the observation of the apostle, that godliness with contentment is great gain, and having food and raiment let us be therewith content, strictly regarding the advice of the beloved disciple, "Love not the world, neither the things that are in the world;" which he inforces by this remark, "If any man love the world, the love of the Father is not in him."

And as it becometh us, as obedient subjects, religiously to observe the close connexion of those excellent precepts, "Fear God; honor the King;" so let us be mindful not to defraud the King of any of his customs, duties, or excise, nor to deal in goods suspected to be run; nor in any wise to be concerned for private gain in any manner of trade prohibited by law.

And let us in an especial manner beware, lest any of us, under the present blessings of outward ease and liberty in religion, be found using that liberty for a cloak of licentiousness, and instead of serving God, serve ourselves and our own

vicious inclinations. It were certainly a most lamentable abuse of the goodness of God thus to pervert His mercies to the corruption of our manners: let us therefore earnestly watch and pray that we may be always preserved from such ingratitude.

And, dear brethren, as many of you as are parents of children, and have experienced the work of Truth in yourselves, cannot but have strong and ardent desires for the welfare of your offspring, not only that they may inherit your temporal estates and outward enjoyments, but above all that they may come, with you, to be made partakers of the word of life, and the glorious hope of a blessed immortality. In order whereunto our advice is, that you be careful to bring them up, in the practice of a diligent and constant attendance of religious meetings, instructing them to wait upon God when there, for the guidance and influence of his holy Spirit, the only unerring teacher and leader into all Truth. We also recommend unto you the practice of retiring to wait upon the Lord in and with your own families; wherein, as your minds are rightly exercised, you may find yourselves qualified to administer such advice and counsel to them, as may conduce to the building up and establishing them in the most holy faith, which, working by love, purifieth the heart, and cleanseth from all unrighteousness. We also tenderly advise you to bring up your children and families in the frequent reading of the holy Scriptures; and to use your utmost endeavors to prevent their having and reading such books as tend to profaneness and irreligion, and alienate their minds from the love of God, and obedience to His requiremings.

Finally, brethren, farewell. "Walk in the Spirit, and ye shall not fulfil the lusts of the flesh." Dwell in love, and the God of love and peace shall be with you. To whom, for the multitude of His mercies vouchsafed to His church and people through Jesus Christ our Lord, be all glory, honor, praise and thanksgiving rendered and ascribed now, henceforth, and for ever. Amen.

Signed in and on behalf of the Yearly Meeting, by
WILIAM DILLWORTH,
Clerk to the Meeting this year.

That which constitutes guilt and incurs condemnation, is a man's persisting in *known* error, in contradiction to the degree of truth, of which he is clearly convinced; this troubles his spirit, darkens his understanding, and at last may totally incapacitate him for a right perception of those things which belong to his peace.

If every man's internal care
Were written on his brow,
How many would our pity share
Who move our envy now!

HUMILITY.

Of all the virtues that adorn character, and ennoble life, none deserve a *higher* place than humility. Its beauty is only equalled by its usefulness; and to possess it should be the constant study, as it is the undoubted duty of man.

It is an observation that has no claim to novelty, that religion is the child of meekness. That it is as true as it is trite, would be as needless for us to formerly demonstrate, as it is impossible for any one to successfully controvert.

The realization of the incomparable power and majesty of the great Creator, necessarily awakens the created to a full sense of his littleness and frailty. And to do that which should be our greatest pleasure, as it is our highest privilege,—to pay God the devotion due him, great lowliness of mind and submissiveness of spirit, are indispensable. We must prostrate ourselves to the very earth, before we can know of that sublime faith which is alone able to exalt us to heaven.

But it is not in relation to things spiritual, but to matters secular, that we mainly desire to treat our subject. The influence of the quality we are discussing, upon man's temporal interest and happiness, if not so apparent, is scarcely less great than on his eternal welfare.

Pride breeds folly and prevents the dispersion of the clouds of ignorance. It inflates the mind with self-conceit, instead of expanding it with useful information. It blunts its perceptions and enfeebles its energies by disuse that self-sufficiency gives rise to, in place of allowing its powers to be quickened and strengthened by vigorous and wholesome employment.

Moreover, it causes the attention to be directed astray from matters of primary importance, or real value, to those of secondary interest, or of an impracticable nature.

Elevated in his own estimation, the proud man refuses to look down from his imaginary height, and despises all that he will not see. Overestimating his powers, he underrates his necessities, and fancies that he is able to do more than his fellow men, without having to acquire the experience and perform the labor that they find necessary. Hence he disregards common means and instrumentalities in his undertakings, and relies upon those that are not reliable, save so far as they depend upon things that he effects to contempt.

Humility, on the other hand, is the best guide that the mind can have. It exposes its weaknesses, makes known its true powers, points out its dangers, and leads to its securities. It guards it alike from the sin of arrogance, and the folly of self-contempt. In short, it is the source of wisdom, and the avenue to all useful knowledge. This is perceivable in every department of labor, and every relation of life that we may contemplate.

The nature of theoretic inquiry, is such as to peculiarly suggest reasons for humbleness in conducting it. When pursued independently of practical application, it, to some extent, involves conjectures and principles not conclusively demonstrated, and there is therefore great danger that the student will wander from legitimate topics, to subjects that mock the strained efforts of human thought. And even when it is followed with reference to results undoubtedly useful, man's labors are but standing mementoes of his ignorance; he is feebly searching for the secrets of that order and harmony which he knows to exist, though he knows not what it is.

Hence it is, that they who have made valuable discoveries, or accomplished important results in the world of speculation, have been mostly distinguished for a spirit of modest self-estimation. They pursued truth as childhood pursues its studies—with docility and submissiveness; and they were only wise teachers and great leaders, as they were attentive pupils and obedient disciples. The greatest of philosophers—Socrates and Bacon—were scarcely more remarkable for penetration, power and sagacity of mind, than for freedom from vanity, moderateness of ambition, and distrustfulness of their own powers. The former, notwithstanding his vast stores of wisdom, was so impressed with the meagerness of what he had attained, compared with the immensity of what lay unacquired before him, as to frequently profess, “that he knew nothing except this, that he did know nothing.” The latter has recorded his opinion, “that if a man begin with certainties, he shall end in doubts; but if he will be content to begin in doubts, he shall end in certainties.”

Indeed, nearly all the delusions that mark the history of philosophic investigation, are readily traceable to a too exalted idea of, and an overweening confidence in the power of the human mind.

This it was that induced Achilles to exclaim, that laws were not made for him, and caused most of the other learned men of the heathen world to fancy that they could explore the mysteries and unfold the secrets of the spiritual universe, thus disposing them to “rush in where angelic steps would fear to tread.”

In modern times a host of errors have sprung from this source. Habitual and deeply-seated skepticism, an excessive and ruinous activity of the intellect, without any definite purposes in view, a disposition to embrace all the novel doctrines and strange conceits that the thoughts or fancies of men may devise, and a wild thirst for reform, which can be satisfied only by overriding the natural law, making evil inseparable from the condition of man, and establishing the chimera of a perfect human system; these comprise a few of them.

In the arts and sciences, there is likewise a great and palpable necessity for unaffected hu-

mility. The natural curiosity that mostly leads men to study them, is soon lost in wonder that the immensity of the spectacle presented to view excites; and the mind is far more awed by the consciousness of what it is unable to grasp, than it is excited by the conviction of what it is capable of possessing.

Besides, the manner in which they are developed, is such as to discourage presumption and self-conceit. The student finds that, however peculiar his character may be, he is obliged to tread a path that is common to all; and that if nature is liberal in her gifts, she is also exacting in her requirements.

He must always submit to the discipline and drudgery of menial labors, before he can know of the successes that crown great endeavors.

Genius no more renders such submission unnecessary, than does mediocrity render it unavailing.

“The ministers and interpreters of nature” did not shun the most lowly paths, nor neglect the most insignificant opportunities. They were mindful of things known to hewers of wood and drawers of water, as well as attentive to matters that require the penetration of powerful and practical intellects. And this was not the result of accident, but a necessity of the case. Had Galileo deemed it derogatory to his dignity, and unworthy of his talents, to patiently experiment on seeming trifles, he would probably have died unconscious of the true relation existing between the earth and the solar system, and the civilized world would not have cause to regard him as a great sage and a brave martyr.

Or had Newton been regardless of such common phenomena as the falling of apples from trees in which they were suspended, he would not have been led to discover important natural laws, the harmony and beauty of which are calculated to inspire the Christian with renewed faith, and to furnish the man of science with additional incentives to laborious investigation.

Nor can the ennobling pursuits of literature be successfully followed, save as the mind is somewhat distrustful of its own powers and open to receive impressions from outside sources.

Not to insist upon the topic that we are tracing paths in which some master spirits have already far outstripped our slow attempts, it is sufficient to remember that but a little of the knowledge necessary to accomplish any valuable literary enterprise, can be justly claimed by any man as his own, much the most of it being derived from the teachings either of other men or of things. And that *title* is not self-existent, but is acquired by the employment of the simple agents of labor, patience and care, which are under the control of all.

Moreover, in the whole intercourse of society, the value of the quality is generally recognized, instinctively at least, if not consciously.

If a man is self-satisfied and exalted in his own estimation, he renders himself liable to severe criticism and general censure.

If he becomes so from the possession of wealth, he is justly accused of contractedness of mind, or if it is owing to dignity of place or power of station, men naturally doubt his capacity to rightly estimate weighty responsibilities, or his desire to conscientiously discharge important trusts. As a happy English writer has observed, "The moment anybody is satisfied with himself, everybody else is dissatisfied with him; whenever a person thinks much of himself, all other people give over thinking about him."

HISTORICAL SKETCHES AND REFLECTIONS.

By S. M. JANNEY.

No. 7.

Through the guidance of divine Providence, Abraham was brought into contact with three of the most civilized nations of antiquity; the Assyrians, Phœnicians and Egyptians. In every country where he sojourned, idolatry prevailed. In Egypt and Canaan the minds of the people were darkened by the grossest superstition. There can be no doubt that the enlightened patriarch bore testimony against the prevailing idolatry; teaching the simple and sublime doctrine of one eternal and omnipresent Being, the Creator and upholder of the universe. His various migrations may have been ordered by Infinite Wisdom, to convey to sincere and seeking minds, in all those countries, the knowledge that had been revealed to him; and to teach them how they might find access to the only Fountain of light and life.

Abraham was the head or chief of a nomadic tribe, composed of herdmen and shepherds, many of whom were born in his encampment. It has been maintained by some modern writers, that the three hundred and eighteen servants "born in his own house" were slaves; but there

is no reason to suppose that chattel slavery, as known in this country, was ever practised by the Hebrew patriarchs. It appears that while Abraham was childless, one of his servants, Eleazer of Damascus, was regarded as his presumptive heir, which does not accord with the usages of modern slavery; and moreover, it would have been impossible for a nomadic chieftain to retain his servants in bondage, unless they were bound to him by the ties of interest and affection. It is probable that in the times of the patriarchs many of those called servants had been redeemed from captivity among heathen nations, and after being instructed in the true faith, they remained from choice, sharing the privileges and protection of the tribe.

The birth of Isaac, the heir of the promises, was to his parents the crowning joy of their lives; and when we consider how long the promise had been deferred, and how amiable was the character of this beloved son, we may safely infer that they would be strongly tempted to place their affections upon him with an absorbing interest, calculated to withdraw their thoughts from their Creator and Benefactor. Abraham, being made sensible of this, conceived himself called upon to give up the child of his old age, to offer him as a sacrifice to God, from whom he received him.

As under the law, subsequently given to the Hebrews, there was annually one offering, the subject of which was not slain,—the oblation of the scape goat,—so in the offering of Isaac there was no command given to slay him; and when the patriarch in the integrity of his heart put forth his hand to take the life of his son, the angel of the Lord called unto him, saying, "Lay not thy hand upon the lad, neither do thou anything to him, for now I know that thou fearest God, seeing thou hast not withheld thy son, thine only son, from me. And Abraham lifted up his eyes and looked, and behold! behind him a ram caught in a thicket by his horns; and Abraham went and took the ram and offered him up in the stead of his son."

This remarkable transaction is twice mentioned in the New Testament, and was undoubtedly regarded by the apostles as an historical fact. In the epistle to the Hebrews it is said: "By faith Abraham, when he was *tried*, offered up Isaac; and he that had received the promises offered up his only begotten son." * * * *

"Accounting that God was able to raise him up, even from the dead; from whence also he received him in a figure." This passage throws some light upon the expression in Genesis, that "God did tempt Abraham."

The meaning undoubtedly is that he was *tried*, for says the Apostle, "the trying of your faith worketh patience." Moses in relating this transaction has, in some of his expressions, adapted himself to the ideas of the age in which he lived; but I suppose that few persons in this age will

object to the observation of Cruden, in relation to the text above quoted: He says, "God does not tempt or try men in order to know their tempers and dispositions; as if he were ignorant of them; but to exercise their graces, to prove their faith, love and obedience; to confirm and strengthen them by such trials, and to give succeeding ages patterns of obedience, to show them his satisfaction with such as obey, and his displeasure at such as do not."

Abraham was only a sojourner in Palestine; he had no landed possession there, and when his wife Sarah died in a good old age, he stood up before the sons of Heth, saying "I am a stranger and a sojourner with you; give me a possession of a burying place with you, that I may bury my dead out of my sight." They answered him courteously, saying "Hear us my lord; thou art a mighty prince among us; in the choice of our sepulchres bury thy dead." But the patriarch declined their offer with equal courtesy; expressing his desire to purchase for its worth in silver, the cave of Machpelah in the end of a field belonging to Ephron the Hittite.

Ephron, in the audience of the children of Heth, offered to give him the field and the cave therein, but the generous offer was declined. It was finally agreed that Abraham should purchase the field for four hundred shekels of silver, being equal in weight to nearly two hundred dollars of our money.

The narrative of the transaction in the book of Genesis, affords a striking picture of oriental manners, described with graphic power and beautiful simplicity.

The same may be said of the chapter which immediately succeeds it, relating to the instructions of Abraham to his eldest servant, respecting the choice of a wife for Isaac, and the journey of the servant to the city of Nahor, in Mesopotamia.

The aged patriarch was not willing that his son and heir should take a wife from among the idolatrous people of Canaan, seeing that on this connection depended the religious welfare of his posterity, and perhaps the preservation of the true faith among mankind. He therefore directed that from his own native country and from among his kindred, a wife for his son should be chosen, and he expressed his confidence that the Lord whom he served would send his angel before them.

Isaac was then forty years old, and the fact that he did not go himself on so important a mission, shows how widely different were the manners and customs of the East at that day, from those which now prevail among Europeans and their descendants. The readiness of Rebecca to go with the stranger who sought her as a wife for his master, is another remarkable feature of the transaction; but even in modern times matrimonial engagements are contracted in Asia on prin-

ciples not far removed from those which prevailed in the days of the patriarchs.

At eventide, when Isaac went out to meditate in the field, he lifted up his eyes, and beheld the camels were coming. The fair Rebecca, being informed by the servant that his master was approaching, alighted and covered her face with a veil. "Isaac brought her unto the tent that had been his mother's, and he took Rebecca to be his wife, and he loved her."

After the death of Abraham there was again a famine in the land, and Isaac, having removed towards the Mediterranean coast, pitched his tents at Gerar, in the country of the Philistines. Here he was favored with a revelation from the Lord, confirming to him the promise made to Abraham, saying, "I will make thy seed to multiply as the stars of heaven, and will give unto thy seed all these countries, and in thy seed shall all the nations of the earth be blessed."

While sojourning at Gerar, Isaac gave way to the same weakness as his father did in Egypt, and adopted the same culpable policy, calling his wife his sister in order to save himself from apprehended danger. Abimelech, the king of the Philistines, reproved him for the unworthy artifice, and said to his own people, "He that toucheth this man or his wife shall surely be put to death." This, however, is the only blemish recorded in the conduct of Isaac, who appears to have lived in peace with his neighbors and in favor with God.

Like his father, he led a pastoral life, depending for subsistence chiefly on his flocks and herds; but not entirely neglecting the pursuit of agriculture. While dwelling at Gerar, he sowed, and received in the same year a return of a hundred fold.

Although the lives of the patriarchs were not immaculate, they were remarkable examples of steadfast faith in God, and fidelity to his commands.

Their simple lives, hospitable manners, and strict integrity, give them an interest in our affections, while their noble testimony to the unity and spirituality of the Supreme Being claims our admiration. In after times, their example was often cited by the Hebrew prophets.

Isaiah thus calls upon the Israelites to place their trust in God:

"Hearken to me ye that follow after righteousness,
Ye that continue faithful to Jehovah,
Look unto the rock whence ye are hewn,
Look to the pit whence ye are digged,
Look unto Abraham, your father,
And unto Sarah that bare you,
For I called him, the one alone,
And blessed him and increased him,
So now will Jehovah comfort Zion,
Will comfort all her waste places,
Will make her wilderness like Eden,
Her desert like the garden of Jehovah,
Joy and gladness shall dwell in them,
Thanksgiving and the voice of melody."

For Friends' Intelligencer.

NATURAL HISTORY OF BIRDS.

BY YARDLEY TAYLOR.

(Continued from page 219.)

The red-headed woodpecker is quite common with us, though, perhaps, not so numerous as they have been. They make their nests by pecking holes in dead trees, and as these are fewer than formerly, these birds have fewer places to build in. When they find a suitable place, they labor at it very industriously, and, from its situation, it is secure from plunderers. They lay five or six eggs. The head of the young bird is not red until it is about a year old. Its red head, with the upper part of the body black, and a broad white stripe across the wings and back, gives this bird quite a conspicuous appearance. By a rapid motion of the wings, and their alternately closing them, it rises and falls in its flight, pursuing a wavy line. It alights oftener on the side of an upright tree than on a level branch, and then supports itself by bracing the strong feathers of its short tail against the tree, similar to the chimney swallow.

They are great lovers of ripe cherries, and get their full share of that fruit, carrying it off to feed their young. In the absence of fruit, they feed on insects and beetles, often taking them on the wing; they sometimes carry the latter to a fence stake, or other place, where, putting it in a crevice, they pick it to pieces. They sometimes attack the points of the young ears of corn when it is in milk and injure them, but the account current of benefit and injury done, if correctly stated, would be in their favor. They peck holes in trees to procure the worms that infest timber, and it is said they never do this unless a worm be there. Some years ago a disease destroyed many of the pine trees of Carolina, and as the decayed wood was in a favorable situation for the increase of the variety of insects that breed in such places, the woodpeckers resorted there in large numbers to feed upon them. The ignorance of the inhabitants induced them to suppose this bird was an injury to their timber, when, in fact, the insect was the real enemy, and they were living upon them. This shows the value of a knowledge of natural history, so far, at least, as to make ourselves acquainted with the habits of birds and insects.

Our woodpecker is not a musical bird, though they have a loud note of call to each other, and they seem to be fond of rapping very quickly with their bills on a shingle, or board of a building, or a dry sonorous branch of a tree, thus making quite a loud noise. They do this, and then appear to listen, as if wishing to hear a like report from another bird, and, after a few minutes, repeat it again. Some writers appear to consider this bird as leading a laborious life, from its habit of pecking holes in trees to make its nest in, which necessarily requires considerable

labor; but such an idea implies that the writers are not aware of the fact, that labor itself is a source of real pleasure, and that the performance of our duty, even when it involves much bodily exertion, is attended with a satisfaction and a pleasure that the unemployed can never realize.

We have another large variety of woodpecker commonly called woodcock. Its head is red, with a rather long neck, and a top-knot on the back of its head, making it quite a showy bird. Its habits are very similar to the other. They all have very strong bills, suitable for the life they lead.

Another bird, of a size between the two last, is here quite common. They are usually called high-holder. Their motions in flight, and other habits, place them in the woodpecker class; their plumage, however, is less gaudy, being brown above, with a darker spot on the breast, and, in flying, they show a good deal of white above the tail and between the wings.

The crow is a large black bird with not a very creditable character; he is charged with rapacity, and there is too much truth in the charge. He will destroy the eggs of other birds, and even the young, when he can get them; he eats insects, fruits, grain, and flesh; even carrion does not go amiss with him, and he is said to be very fond of fish. In Virginia, we are not much annoyed with them. The large flocks of them that are seen in some sections of our country, do not come here until winter, and then if our farmers have not their corn crops gathered, they will get their share, but seldom pull up our planted corn in the spring. They do more good, no doubt, than mischief, by living a good deal on insects. They are noisy birds, but have no music, their cry is only a loud haw. If one is crippled, or in danger, and makes a note of distress, its comrades will come from a considerable distance and join their cries for its assistance. They will fly after and chase larger birds, such as hawks, owls, and eagles, and have been known to be caught by the latter, while on the wing. They build in high bushy trees, and make their nests entirely of small sticks, with very little hollow in the top; they lay four or five blue eggs.

Another large bird, near the size of the crow, but different in form, is occasionally found here. It is called the bittern, and is of the heron family. Its legs and neck are long, suitable for wading and fishing in shallow waters. It is nearly the color of the crow, and builds its nest very similarly, but does not use so much material, and builds on lower trees and in orchards. It feeds on small fish and tadpoles, and may often be seen wading in the water after its prey.

The cardinal grosbeak is a beautiful red bird, of handsome form, rather less in size than the robin. The male, only, is of that color, the female being rather smaller and of a much more subdued and plain color. They are rather scarce,

and have no practices that we have reason to find fault with.

The wren is a small, but very interesting little bird. He is very sociable, and likes to build in or near a dwelling, wherever he can find a cavity or hole suitable to his wishes. We put up earthenware houses for them, and they seem well pleased with such fixtures. They build with small sticks and line with softer material. They lay often 6 or 8 eggs, and the young leave the nest soon after being able to fly a short distance. They are industrious little creatures, and may be seen, when building their nests, tugging at a stick; when it is too long to get it into the hole crosswise, they will put one end in first and thus succeed. When their young are hatched, they may be seen busily at work, bringing food for their large family.

The wren destroys vast quantities of small worms for food, and may be seen hopping from branch to branch, among the leaves of trees and bushes, searching for them; then for a little recreation, he will mount a pailing, or other small elevation, and with his head up and tail down, will twitter away with his sprightly song for some time.

But the most beautiful and smallest of the feathered race with us, is the humming bird. The glassy smoothness of the feathers on the neck and breast, when seen in certain shades of light, reflect changeable hues as completely as the finest silk, or the hues of the rainbow. The rapid motion of their wings produce a humming sound, whence their name, and they can suspend themselves before a flower with their bodies still and their wings in motion. They are generally supposed to live on the honey of flowers, but some naturalists assert that the small insects often found near the nectaries of flowers, is their food. They are among the last birds that arrive in the spring, not coming until flowers make their appearance in considerable numbers. Their nests are quite a curiosity, and are rarely seen. They are made of small bits of moss taken from the bark of trees, cemented together and lined with the finest down. They are found on the top of a horizontal branch of about an inch in diameter, sometimes where a small limb comes out at right angles; and, being of the color of the bark, are hard to find. It is rather larger than the largest sized thimble, and of about the same height. At the decline of flowers, they leave us for a milder climate.

The bob-o-link is a very pretty bird that passes here in the spring, and breeds further north; we do not see them in the summer. In the south, they are called the rice bird, from the habit of feeding on that grain; and in the north, the reed-bird, from the habit of frequenting marshes covered with reeds. The name of bob-o link is taken from the resemblance of a part of its song to the sound of those syllables. In the fall of the year they get very fat, and in their passage

south, they are much sought after by sportsmen, being considered a delicious morsel for epicures.

The killdeer is rather an odd looking bird, with larger legs than land birds generally have. When standing, the body of the bird is more nearly in a horizontal line, than that of most birds; the tail and wings are moderately long and slender, and with its long legs and light body, give it quite a slender appearance. It uses its legs briskly, and can run quite fast on the ground, and from some of its notes its name has been taken. This bird lays two eggs on the ground, without any further preparation of a nest, than merely gathering a few small stones or gravel around, as if to keep the eggs from rolling away, and often not even that much. They leave us in the winter.

The snipe is rather a rare bird with us; it is larger than the partridge and of much the same color, but of different habits. It has a slender bill, two or three inches long. They frequent wet and marshy grounds, and with their long bills probe the soil after the worms and insects that frequent such places. They are considered good eating.

There are several varieties of birds occasionally seen here, for which we have no particular names. One of them is a bird rather less in size than the dove, lighter in color and of handsome form. It usually frequents shady woods, and has a note somewhat resembling the cooing of the dove, which weather-wise prognosticators say is more frequently heard before a rain than during dry weather. Hence they call it rain crow. A small bird is occasionally seen, about the size of the sparrow, with the feathers on the upper part of its body of a bluish-green color. But little is known of its habits; probably they are similar to that of the sparrow. Another small bird, in shape like the killdeer, but smaller, is often seen in our small shallow streams and along sandy places near them, and appears to be somewhat an aquatic bird, though not in the habit of swimming.

PILGRIM'S WAY SONG.

BY H. F. GOULD.

I'm bound to the house of my Father;
 Oh, draw not my feet from the way,
 Nor stop me these wild flowers to gather;
 They droop at my touch, and decay!
 I think of the flowers that are blooming
 In beauty unfading above,
 The wings of kind angels perfuming,
 Who fly down on errands of love.

Of earth's shallow waters the drinking
 Is powerless my thirst to allay;
 Their taste is of tears, while we're sinking
 Beside them where quicksands betray.
 I long from the fount ever-living
 That flows by my Father's own door,
 With waters so sweet and life-giving,
 To drink and to thirst never more.

The gold of this bright happy dwelling
 Makes all lower gold to look dim ;
 Its treasures all treasures excelling,
 Shine forth and allure me to Him.
 The gems of this world I am treading
 In dust, where as pebbles they lie ;
 To win the rich pearl that is shedding
 Its lustre so pure from on high.

For pains a torn spirit is feeling,
 No balsam from earth it receives,
 I go to the tree that is healing,
 To drop in my wounds from its leaves.
 A child that is weary with roaming,
 Returning in gladness to see
 Its home and its parent, I'm coming,—
 My Father, I hasten, to thee !

THE CROOKED FOOTPATH.

Ah, here it is! the sliding rail
 That marks the old remembered spot,—
 That gap that struck our schoolboy trail,—
 The crooked path across the lot.

It left the road by school and church,
 A pencilled shadow, nothing more,
 That parted from the silver birch
 And ended at the farmhouse door.

No line or compass traced its plan ;
 With frequent bends to left or right,
 In aimless, wayward curves it ran,
 But always kept the door in sight.

The gabled porch, with woodbine green,—
 The broken millstone at the sill,—
 Though many a rood might stretch between,
 The truant child could see them still.

No rocks across the pathway lie,—
 No fallen trunk is o'er it thrown,—
 And yet it winds, we know not why,
 And turns as if for tree or stone.

Perhaps some lover trod the way
 With shaking knees and leaping heart,—
 And so it often runs astray
 With sinuous sweep or sudden start.

Or one, perchance, with clouded brain
 From some unholy banquet reeled,—
 And since, our devious steps maintain
 His track across the trodden field.

Nay, deem not thus,—no earth-born will
 Could ever trace a faultless line ;
 Our truest steps are human still,—
 To walk unswerving were divine !

Truants from love, we dream of wrath ;—
 Oh, rather let us trust the more !
 Through all the wanderings of the path,
 We still can see our Father's door !

Correspondence of the Evening Post.

THE CASE OF MANUEL MASON.

Washington, May 24, 1859.

I have alluded once or twice to the hard case of Manuel Mason, a colored man, in Washington. The case has just been opened afresh to me by responsible parties, and I have gathered the following facts, which are so startling that I venture to send them to you at the risk of tiring your readers with the case. Let me premise by

saying that the facts can be *proven* in any decent court.

Said Manuel Mason and his wife were slaves of a white woman, living a few miles out of the city. A few years ago Manuel was taken sick with inflammatory rheumatism, and was given up by the doctors as incurable. Under these circumstances his mistress offered to sell him for \$300. Nobody would touch him at the price. Finally she offered to give the cripple his freedom for \$300, he to pay her in instalments. He accepted the offer, and paid off the entire sum in due course of time. He partially recovered his health, and *hired the time of his wife* for so much a year, that she might keep house for him in Washington. They raised a large number of children *at their own expense*, but invariably at about the age of ten years the mistress took away each child and sold it off or appropriated it to her own use.

At last *only one* child was left—"little Ben." He was, like all youngest children, a favorite—the baby—the comfort of the old man and woman.

In September last, one of our new police approached the small dwelling of Manuel Mason, in search of "little Ben," for the last child must be taken to minister to the voracious appetite of the monster, slavery. Benjamin was missing, however. The father never had him in his power or possession for one moment, yet he was suddenly arrested for "harboring a slave." The law dates 1707, under which he was taken, and the literal penalty is "one hundred pounds of tobacco per hour" for each hour of harboring a slave. You will perceive that the father was simply guilty of not finding his runaway boy. The officer told Mason to hunt up his boy, and upon his neglecting to do this, he was thrown into jail. Although no evidence was offered against him, yet the Justice would not let Mason out on any less bail than \$1500, which was furnished by a kind-hearted citizen of the district. A jury very quickly brought in a verdict of guilty, though with no more evidence of guilt than is to be found in this letter. Mason was remanded to jail, where for days he lay without a bed, and all the time with scant clothing. He lay in jail forty-nine days before Judge Crawford would deign to sentence him. The sentence was to pay a fine of \$166 66; being \$1 66 "for every hour the slave was harbored—one-half of said amount to go to the use of the owner of the slave, and the other half to the United States." I quote from the Judge's sentence as reported in the National Intelligencer. Mason was also sentenced to pay all costs, and to remain in jail till the entire sum was paid! The District Attorney was at last prevailed upon to consent, upon ample security that the money will be paid at the end of three months, to let the poor negro go, and he is at liberty once more.

WOMEN AND WORK.

BY BARBARA LEIGH SMITH BODICHON.

(Continued from page 222.)

Professions want Women.

Ask the thousands of soldiers who passed under the consoling hands of Florence Nightingale and her noble band, what profession wants women? The profession of nursing wants women, and will have them. I think those same soldiers, if they could vote, would elect women to fill the whole commissariat department.

Ask the emigrants who went out to Australia year after year under the careful and wise system of Caroline Chisholm's colonization, how women can organize and what professions they should fill? I think they would answer, "As organizers of colonization, emigration, secretaries to colonies," &c., &c.

Ask those interested in the reform of juvenile criminals. They will say, "Mary Carpenter is appointed by nature to be establisher and inspector of such schools. Women are wanted in the vast vocation of reformation."

Miss Dix is another appointment by Divine command. She has established lunatic asylums in every part of the Union, and caused between thirty and forty Acts to be passed by Legislatures for the better care of the insane, writing the clauses herself, never trusting a word to clerks and officials.

She has visited asylums in every country in Europe, except Spain and Portugal, and has been also in the East, *always alone*, studying prisons and charitable institutions, and never met with any difficulties any brave woman might not conquer.

Miss Dix believes educated women would be of the greatest use in the care of the insane. She herself has remarkable power, and has frequently calmed raving madmen whom no one else dared approach.

There is a lunatic asylum at Ghent, in Belgium, containing 269 patients, entirely under the care of the Sisters of Charity. Rarely is restraint, or even seclusion, employed, and although 201 of the patients are considered incurable, the Sisters are perfectly competent to their task.

The heroic conduct of Mrs. Patton proves that a woman can learn to take observations, and to keep the reckoning of a ship to some purpose; the story of her noble courage is fresh in the minds of all.

We might give many more instances.

The work which women do for the press is considerable. It is difficult to know how much. I know of six journals edited by women in America; two-thirds of the writers in *Chambers' Edinburgh Journal* are women; Mrs. Johnson, of Edinburgh, was for years the real editor of the

Inverness Courier, the principal paper in the North of Scotland.

Perhaps there is no profession which so calls for woman as that of medicine. In New York there are three very eminent female physicians, and a hospital established through the exertions of Dr. Elizabeth Blackwell, into which women are received as students.

In Boston, Dr. Harriet K. Hunt has practised for twenty years. In Philadelphia, Dr. Ann Preston is professor of physiology to the Female Medical College. But in England, Jessie Meriton White attempted in vain to obtain a medical education. She applied to fourteen London hospitals, and was refused by all. The London University, the most liberal community in England, refused to admit her as a candidate to the matriculation examination. In fact there is no way of obtaining a diploma in England.

In prisons and workhouses women are much needed. An earnest quiet woman in such places has more power than a strong man. The prisoner, the ruffian, the lunatic, feel, what Shakespeare has said—"Your gentleness shall force sooner than your force move me to gentleness."

Women can be designers for art, manufacture, and, with proper training, show themselves remarkably apt at ornamentation. All that appertains to interior architecture is especially woman's province, though there is no reason at all why a woman should not build a cathedral if she has the instruction and the genius.

There is no reason why women in England and America should not make as good watches as the women of Switzerland. The watch-making men of course, are against it, and persecute all who begin; this is natural, but let some thousands of the 50,000 women of London, who are working for under six pence a day, enter this new profession, and the persecution will cease.

Of the profession of teacher, we can say what Webster said of the law—"There is always room above." For well trained teachers there is a great demand—below them is no room—nothing but starvation.

Of the remarkable woman teachers, Mrs. Luce is an instance. Mrs. Luce, twenty-eight years ago, came to see the necessity of giving some education to the female children of the Moors, Turks, and other Mohammedans of Algeria. The attempt was considered utterly impracticable, as the men of those races keep their women entirely inmured and entirely ignorant, and all their prejudices as husbands and Mohammedans are strongly against even allowing them to leave their houses.

In spite of all difficulties—want of money, want of help, want of government countenance against the furious prejudices of the people themselves, Mrs. Luce succeeded; and I have seen above a hundred Moorish girls, from 4 to 18, assembled together in a beautiful Moorish house,

busy over their slates and books as any little Europeans or Americans. No one who does not know what difficulties Mrs. Luce has had to struggle against, can at all appreciate the magnitude of the work she has accomplished.

Never since the world began have women stood face to face with God. Individual women have done so, but not women in general. They are beginning to do it now; the principle that Jesus Christ laid down is beginning to be admitted. Young women begin to ask at the age of sixteen or seventeen, "What am I created for? Of what use am I to be in the world?" According to the answer is often the destiny of the creature.

Mothers! the responsibility lies with you: what do you say in answer? I fear it is almost always something to this purport: "You must marry some day. Women were made for men. Your use is to bear children; to keep your home comfortable for your husband. In marriage is the only respectable life for woman."

If a girl has a religious or an inquiring mind, she will be much dissatisfied with this answer, and say, "But if no one ask me to marry whom can I love? or suppose I do not want to marry? Suppose my husband dies? or, what am I to do all the years I have to wait for a husband? Is there nothing I can do for anybody?"

The newness of the world and the vigor of young life will prevent some years from being absolutely miserable. Among the rich, music, languages, drawing—"accomplishments," in fact, fill up much of life, and stop the questionings and discontent of heart. In so far as they do this they are pernicious. In so far as they are amusements only, they are killing to the soul. It is better far to hear the voice of the hungry soul loud and crying. It is better to have the bare fact of idleness than to be busy always doing nothing. Accomplishments which are amusements only, do more harm than good. Do not misunderstand: all "accomplishments" may be works, serious studies; and may, by helping others to bear life better, and giving pleasure to those who have none, be made worthy work for woman; but for this end they must be studied faithfully and with self-devotion.

Women in modern life, even in the humblest, are no longer spinsters. Their spinning is all done by the steam engine; their sewing will be soon all done by that same mighty worker. The work of our ancestresses is taken away from us; we must find fresh work. Idleness, or worse than idleness, is the state of tens of thousands of young women: in consequence, disease is rife amongst them; that one terrible disease, hysteria, in its multiform aspects, incapacitates thousands.

There is nothing in the world so sad, so pitiful to see, as a young woman, who has been handsome, full of youthful joy, animal spirits

and good nature, fading at thirty or thirty-five. Becoming old too soon, getting meagre, dried up, sallow, peevish, the one possible chance of life getting very uncertain, and the mind so continually fixed on that one hope that it becomes gradually a monomania.

It is difficult for fathers and mothers when they look at their daughters, young, charming, full of cheerfulness and life, to think that they can change; but, alas! probably they will in ten years change sadly. No cheerfulness that does not spring from duty and work can be lasting.

I believe more than one half the women who go into the Catholic Church join her because she gives work to her children. Happier far is a Sister of Charity or Mercy than a young lady at home without a work or a lover. We do not mean to say work will take the place of love in life; that is impossible; does it with men? But we ardently desire that woman should not make *love their profession*.

Love is not the end of life. It is nothing to be sought for; it should come. If we work, love may meet us in life; if not, we have something still, beyond all price.

To many of you the question comes direct, whether you will accept a dependent, ornamental and useless position, or an independent and hard working one. Never hesitate for one moment; grasp the hand that points to work and freedom. Shake the hand with thanks of refusal, which offers you a home and "all the advantages of city society until you are married." Say that you prefer to pay your own way in the world, that you love an honorable independence better than to live on charity, though gilded with all the graces of hospitality and affection. Plan for yourselves a life of active single blessedness and usefulness. Be sure this is nobler and happier than many married lives, and not a hell at all, as some tell you; and is the way, too, to secure a happy marriage, if that is your destiny.

Wise young men, exposed to all the uncertainties of fortune in this age of excessive hazard and frequent revulsion, ought to be very cautious about assuming the support of a human being unaccustomed to be anybody's helpmeet.

If women were in active life, mixing much with men, the common attraction of sex merely would not be so much felt, but rather the attraction of natures especially adapted to each other.

— "Whoever says
To a loyal woman, 'Love and work with me,'
Will get fair answer, if the work and love,
Being good themselves, are good for her, the best
She was born for. Women of a softer mood,
Surprised by men when scarce awake to life,
Will sometimes only hear the first word, Love,
And catch up with it any kind of work,
Indifferent, so that dear Love go with it.
I do not blame such women, though for love
They pick much oakum."

(To be continued.)

It would be some check to self-confidence, if every one who differs in opinion with another, would *calmly* consider, that as two contraries cannot be true, *possibly* he may be wrong and his opponent right.

The following remedy for a burn or scald has been sent us by a subscriber, who attests its efficacy after an experience of 30 years.

Burgundy Pitch 1 oz. ; Bees wax $\frac{1}{2}$ oz. ; a tea-cupful of lard ; simmer these together, and strain from the dregs into earthen or glass jars to prevent rust. The first dressing not to be removed until the third day ; after this, change the dressing every day.

ITEMS OF NEWS.

PRESENT OF AN IMMENSE METEORIC BODY IN OSWEGO COUNTY.—On Wednesday morning, the inhabitants of the towns of Boyleston and Redfield, in this county, were startled by the occurrence of a most remarkable phenomenon—the descent from the heavens of an immense meteoric mass. The body struck the earth between the hours of three and four o'clock, P. M., with a crash that was truly terrific, and the shock was sensibly felt and people aroused from their sleep at a distance of five miles from the scene. The body fell upon the farm of Horace Sanger, situated on the line of Boyleston and Redfield, striking in a meadow and partially on the highway. It is estimated by our informant to cover about half an acre of land. The earth was torn up in a terrible manner, and large fragments were thrown a distance of two thirds of a mile. The mass is very irregular in shape, and rises at some points to sixty and eighty feet in height, and is supposed to be imbedded in the earth as many feet. The surface has generally the appearance of iron ore. The excitement occasioned by the event among the inhabitants was intense, and the crash is said to have been terrific beyond description. Many supposed that the final winding up of terrestrial affairs had truly arrived.—*Oswego Palladium.*

If the Lunarians throw such stones as these at their neighbors on this globe, some Yankee will have to invent a crown piece, to prevent skulls from being cracked. A stone which "covers a half acre of land" is a considerable sized pebble, and Barnum should not let so interesting a celestial visitor remain an object for the limited population. It is large enough to satisfy the curiosity of a "metropolis."

PROGRESS OF THE ITALIAN WAR.—GREAT BATTLE BETWEEN THE FRENCH AND AUSTRIANS AT MAGENTA.—The news by the Anglo-Saxon is that a general action had taken place at Magenta, between the Austrians and the French, and that the Austrians have been defeated, with a loss of 25,000 in killed, wounded and prisoners, 7,000 of the latter falling into the French hands. The French loss is variously given at from 3,000 to 12,000. The latter number is probably more near the truth, as the battle evidently was a hotly contested affair.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Market quiet. Receipts of Flour continue light, but prices are barely supported. There is no inquiry for export or speculation. Sales of good superfine are reported at \$7 25, common extra at \$7 00, and good Western extra at \$7 50. The sales

to the home trade are limited between \$7 00 and \$8 50 for fancy lots. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 50, and the latter at \$4 per barrel.

GRAIN.—Wheat is dull and without demand. Sales of Pennsylvania and Western red at \$1 70 a 1 75, and and white at \$1 80 a 1 85. Rye is selling at 95 c. Corn is dull, and prices drooping. Sales of yellow at 85 cts., afloat. Oats are dull and lower. Sales of prime Delaware at 47 cents, and Pennsylvania at 50 cents. Sales of Buckwheat at \$1 75 and \$1 80, which is a still further advance.

CLOVERSEED comes forward slowly, and prime lots are in demand at \$5 50 per 64 lbs. Timothy is more abundant and prices drooping.

A well qualified teacher is wanted to take charge of Darby Monthly Meeting School. Application can be made for further information to

RACHEL T. JACKSON or
M. FISHER LONGSTRETH

6th mo. 1st, 1859. Darby P. O. Penn.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00 ; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50 ; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address

WM. HICKLEN,
Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,
Cheap School Book Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address
HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
4th mo. 9—3m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SEVENTH MONTH 2, 1859.

No. 16.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.
On the Divine Being.

(Continued from page 226.)

Let us now turn our attention to the history of the Christian church, and trace the progress of this "mystery of iniquity," until it became inscribed on the very front of her doctrines. In order to show this, I will quote a few sentences from Mosheim's Ecclesiastical History, which is generally esteemed the best. In his account of the *first century*, he says:—"The method of teaching the sacred doctrines of religion, was at this time most simple, far removed from all the subtle rules of philosophy, and all the precepts of human art. This appears abundantly, not only in the writings of the apostles, but also in all those of the second century which have survived the ruins of time. Neither did the apostles, or their disciples, ever think of collecting into a regular system the principal doctrines of the Christian religion, or of demonstrating them in a scientific and geometrical order. The beautiful and candid simplicity of those early ages, rendered such philosophical niceties unnecessary; and the great study of those who embraced the gospel, was, rather to express its divine influence in their *dispositions* and *actions* than to examine its doctrines with an excessive curiosity, or to explain them by the rules of human wisdom. There is indeed extant a brief summary of the principle doctrines of Christianity in that form which bears the name of the apostles' creed, and which, from the *fourth century* downwards, was almost generally considered a production of the apostles. All, however, who have the least knowledge of antiquity, look upon this *opinion as entirely false*, and

destitute of all foundation."* In treating of the second century, he says, "This venerable simplicity was not indeed of a long duration; its beauty was gradually effaced by the laborious efforts of human learning, and the dark subtleties of imaginary science. Acute researches were employed upon several religious subjects, concerning which ingenious decisions were pronounced; and, what was worst of all, several tenets of a chimerical philosophy were imprudently incorporated into the Christian system." †

In reviewing the doctrines of the third century, he says: "But the *Christian doctors* who had applied themselves to the *study of letters and philosophy*, soon abandoned the frequented paths and struck out into the devious wilds of fancy. The Egyptians distinguished themselves in this new method of explaining the truth." ‡ But when he comes to the fourth century, he says, "The fundamental principles of the Christian doctrine were preserved *hitherto* uncorrupted and entire in most churches, though it must be confessed that they were often explained and defended in a manner that discovered the greatest ignorance and utter confusion of ideas. The disputes carried on in the Council of Nice concerning the *three persons in the Godhead*, afford a remarkable example of this, particularly in the language and explanations of those *who approved of the decisions of that council*. So little light, precision, and order, reigned in their discourses, that they appear to substitute three Gods instead of one." § Again he says: "The faction of the Donatists was not the only one that troubled the church during *this century*. *Soon after its commencement*, even in the year 317, a new contention arose in *Egypt*, upon a subject of much higher importance, and with consequences of a yet more pernicious nature. The subject of this fatal controversy, which kindled such deplorable divisions throughout the Christian world, was the doctrine of *three persons in the Godhead*; a doctrine which, in the *three preceding centuries*, had happily escaped the *vain curiosity of human researches*, and been left undefined and undetermined by any particular set of ideas." § The emperor Constantine assembled, in the year 325, the famous council at Nice, in Bythinia, wherein the deputies of the church universal were sum-

*Ecc. His. London ed. 1826, p. 84. † p. 135. ‡ p. 200.

§ Ecc. His. Lon. ed. 1826, p. 269.

§ Ecc. His. Lon. ed. 1826, p. 302.

moned to put an end to this controversy. In this council, "after many keen debates and violent efforts of the two parties, the doctrine of Arius was condemned; Christ declared consubstantial, or of the same essence with the Father; the vanquished presbyter *banished among the Illyrians*, and his followers *compelled to give their assent to the creed* or confession of faith which was composed by this council."*

This was established by law, for the first time, the doctrine of the trinity; which, it does not appear, was ever heard of till nearly 300 years after the promulgation of Christianity. This doctrine seems to have originated in the speculations of visionary philosophers,—it was established by a council^o of contentious bishops,—and enforced by the sword of a Roman emperor. Previous to this time, different opinions had been entertained on this subject, "without giving the least offence;"† but now "the woman" was seated on the beast of temporal power; the name of "*mystery*" was written on her forehead; and she went on *from this period*, multiplying her absurd doctrines and ridiculous ceremonies, and persecuting all who would not conform to them; until at length she became "drunken with the blood of the saints, and with the blood of the martyrs of Jesus."

James. This piece of history is very instructive; it shows us how very dangerous it is to give up our own understandings, and to receive without examination whatever doctrines may be taught by the ministers of religion. Every *practical Christian* who reads his Bible and examines the book of his own experience, is just as capable of judging for himself as the most learned priest or professor of theology. It appears that the scholastic divines of the fourth century not only forced a creed upon the people, but many of the bishops had the address to obtain large revenues‡ for teaching these mysteries, which they did not themselves understand. If people can only be persuaded to shut their eyes, they may be led any where; for then they can no longer distinguish between darkness and light.

John. It appears to me, that the doctrine of the trinity is taught in the Scriptures, although the *name* is not found there. I cannot see how any person who believes in the divinity of Christ can doubt this doctrine; for if we believe that the Father, Son, and Holy Ghost, are each of them Divine, it appears to me that the doctrine is established,—unless we say that these are only three different names for one and the same Being.

Father. I believe in the divinity of Christ, but I cannot receive the doctrine of three persons in one God. The views of William Penn on this subject are so consistent with my own, and so well expressed, that I will quote them to you.

* Mosheim, p. 305. † p. 303. ‡ p. 195.

He says, "I sincerely own, and unfeignedly believe in ONE, holy, just, merciful, almighty, and eternal God, who is the father of all things; that appeared to the holy patriarchs and prophets of old, at sundry times and in divers manners; and in one Lord Jesus Christ, the everlasting wisdom, divine power, true light, only Saviour and preserver of all, *the same ONE, holy, just, merciful, almighty and eternal God*, who in the fulness of time took and was manifested in the flesh; at which time he preached (and his disciples after him) the everlasting gospel of repentance, and promise of remission of sins and eternal life to all that heard and obeyed; who said, He that is with you, (in the flesh,) shall be in you, (by the spirit,) and though he left them, (as to the flesh,) yet not comfortless, for he would come to them again, (in the spirit;) for a little time they should not see him, (as to the flesh,) again a little while and they should see him (in the spirit); for the Lord (Jesus Christ) is that Spirit, a manifestation whereof is given to every man to profit withal. In which Holy Spirit I believe as the *same almighty and eternal God*; who, as in those times he ended all shadows, and became the infallible guide to them that walked therein, by which they were adopted heirs and co-heirs of glory; so am I a living witness that the same holy, just, merciful, almighty, and eternal God, is now, as then, (after this tedious night of idolatry, superstition, and human inventions, that hath overspread the world,) gloriously manifested, to save from all iniquity, and to conduct unto the holy land of pure and endless peace, in a word, to tabernacle in men."*—[See Penn's Innocency with her open face.]

(To be continued.)

ROOM FOR GOD IN THE HEART.

It may be that the hearts of God's people are so filled with His earthly blessings that there is not room enough left in them for himself.—The giver surely should ever have a prominent place among his gifts; and if the proprietor does not make this provision, He, the giver, often vacates a place in the heart, in order to have a "spare room" for Himself; and when he comes for this purpose, marvel not if he takes the best room of the apartments, that is the one occupied by the nearest friend, since he knows that this place is none too good for him. When such vacancies are made it is not wise to fill up the unoccupied place with the world's trumpery, as too many do. The door leading to that apartment should be kept locked against all such intrusion, and sacredly reserved till the Master comes and knocks at it for entrance. Then if we cordially open the door and bid him a welcome in, this

*See 1 Cor. viii. 5, 6; Heb. i. 1; 1 Cor. viii. 6; John i. 14; 1 Tim. iii. 16; Mat. iv. 17; Luke xxiv. 47; John xiv. 17, 18, xvi. 16; 2 Cor. iii. 17; 1 Cor. i. 7; Rom. viii. 14, 17; Rev. xxi. 3; Prov. xxviii. 13.

heavenly guest will spread his own feast for the soul's entertainment. The room will be fragrant with his presence—redolent of his blessings.—Then shall we not have occasion to speak of that apartment as forsaken and desolate, for it will be more richly occupied than ever before.

We ought to balance the good with the bad, and also the length of time a man has lived, to form a true estimate of his character. Polybius, the Greek historian, has an observation to the same effect. "There is no reason," says he, "why we should not sometimes blame and sometimes commend the same person; for as none is always right, neither is it probable that he should be always wrong."

EXTRACTS FROM "MIDDLE LIFE."

It is perhaps not without some shade of sadness that one comes to rank himself in middle life. Slowly it dawns upon him, reluctantly he admits it. It is no sense of growing old that teaches him, no flagging of the powers of the spirits, not even the taunt of that opprobrious epithet now-a-days flippantly flung at middle life—for the *fogy* is not the old, but the middle-aged man—but one finds that, with the fuller flesh and firmer muscle, and stronger tread and truer poise of his faculties—while yet his sympathies are all young and fresh, while yet he waits to follow where the older and the wiser lead—the world about him waits and looks at him, pushes him forward where he hesitates, until he discovers that, no longer looked upon as young, he must take his place in the toiling and exposed van, and hew the way in which other steps shall tread.

The character of middle life is the character of the man. It is that by which he is known, that by which he makes his mark, that by which he does his good or evil; it is the character that he carries with him into age and into the presence of his Maker. The bright visions of youth are past. Sorrows, disappointments, griefs, have overtaken us, and we are made to see how solemn and how real a thing it is to live—how vain and weak and ignorant is the unsupported soul of man. Amid trials and toils, the attendant witnesses of a Father's discipline and oversight, amid defeats which each day testify to our insufficient principle, our advancing years lead us. Shall all this pass us as the summer breeze passes the wheat field, leaving it standing and smiling as before? Shall we not have gained some steadiness, some stateliness of character, some other reverence than for ourselves? Shall the old frivolity still cleave to us, the garb of childhood on the frame of man, the old love and pursuit of pleasure, the old, often vanquished, self-confidence? Shall we be growing into years with all the frippery of childhood lingering about

our hearts, our manners, our hopes, our attainments? Not so. Middle life is for higher things; for the casting off of the childish and unworthy, and the putting on of the whole man—even of the man after Christ. Saddest of all sad sights is it to see the probations of a human soul wearing towards its noon, while no deepening tinge to character proclaims the ripening within, while all things say how closely and wilfully still it clings to its grosser and meaner delights. Old age is not of necessity beautiful. All do not know the secret of the art of growing old gracefully. It is an art which middle life works at and perfects. The secret lies back there. Serene and waiting and beloved age is the result of honorable and virtuous middle life; and age, querulous, exacting, burdensome to itself and others, is the product of selfish, frivolous middle life.

The influence of middle life grows directly from its character. It cannot be otherwise than that. Occupying the fore-front in the struggle, it must be that many eyes are turned toward it, and many actions determined by it. The young say a great deal against the middle-aged, and set themselves many ways in opposition; but after all they are guided, influenced, by middle life more than they know, in some things more than is for their good. I believe there are few so potent influences as that of a well-ordered, chastened, religious middle life, in which the virtues are trained to know their place and duty. There are influences that seem to have a mightier sweep and sway, as the wrath and havoc of the tempest seem more mighty than the steady fervor of the noon. But the meridian sun restores, by its silent, unintermitted presence, what the other disturbed; and the genial and ripened graces of middle life, perpetually present and perpetually acting, sink into the deep places of men's thought and love, and reproduce themselves. Think of the lovely characters you have known adorning middle life; recall the blessing they have often been to the parched thirst of your own soul. Think of those who have gone from us in the full power of their influence, leaving such legacies to the heart and to the world that they seem to have lived out a good old age,—perpetually surprising us as we remember that they had not lived long, but well. They had learned the true art of life, to crowd its narrow span

"With wise designs and virtuous deeds";

and so, though little time was theirs, they had made it yield what length of years alone never does. Is not middle life an influence, and, nobly trained in us, may it not be as one of the great means by which God will bring in his rule among men?

I doubt if those of middle life think seriously enough of this influence, especially of that which is exerted inevitably and unconsciously. I do not believe in doing anything for the sake of

example, nor would I give any quarter to that indolent self-indulgence which seeks to palliate and excuse its errors by pointing to the like in another. Still, each man ought to have some thought as to the character of the influence he exerts, and regulate his conduct and his speech with a wise caution that no just censure may lie against him for contaminating the inexperience of youth.

You may call the occupants of the middle ground of life care-worn and faded and uninteresting, and you may lavish on youthful loveliness and enthusiasm all your admiration; but better, braver, more to be admired, is the spirit of middle life that unselfishly accepts its duty amid the dust and toil, that goes serenely forward, buoyed by no ignorant enthusiasm, but with a sober sense of difficulty and of trial, leaning not upon itself, but trusting well in God. It may not fill your eye with any exquisite exterior,—it may not thrill your heart with any great or sudden doing, but the angels, who look deeper, may see under all the outward array of privation, opposition, pain, a beauty growing fit for transplanting into heavenly gardens. Plain and dull and hard and matter-of-fact may be the doing of middle life, but it is the best doing for the individual and the race, from which none should shrink, which none but the unwise could ridicule or condemn.

Friends of the middle life! It is ours to take and hold the field for God. Graciously he gives to us the name and the privilege and the post of laborers. The stern task of life is upon us, better than the dream of youth or the repose of age. Our sun nears or has passed its meridian. It is the summer season of toil. The young are to be guided, moulded by our character and influence, and in our homes and by our guardian care it is to be that the old shall repose in peace and hope. Let us feel the honor, and accept the duty, and do it all, without haste and without rest, and God guide us and preserve us!

J. F. W. W.

EXTRACTS FROM THE MINUTES OF PHILADELPHIA YEARLY MEETING OF WOMEN FRIENDS.

At a Yearly Meeting of Women Friends, held in Philadelphia, by adjournments, from the ninth of Fifth month, to the thirteenth of the same, (inclusive) 1859.

Reports were received from all our constituent Quarterly Meetings, also, from Fishing Creek Half Year's Meeting. The representatives, being called, were present, except five; for the absence of two, sufficient reasons were assigned.

Epistles from our sisters, at their Yearly Meetings of Ohio, Indiana, and New York, were read to our edification and encouragement.

The representatives were desired to confer together, in order to be prepared to propose to the

afternoon sitting the names of friends suitable to serve this meeting as Clerk and Assistant Clerk the present year.

Afternoon.—Lucretia Mott, on behalf of the representatives, reported that they were united in proposing for the consideration of the meeting the name of Mary S. Lippincott for Clerk, and Mary S. Michener for Assistant Clerk.

The meeting also uniting, they were appointed to the service the present year.

Epistles from our sisters, at their Yearly Meetings of Genesee and Baltimore, were read to our comfort and refreshment.

An affectionate Epistle, addressed to this Yearly Meeting, from our beloved aged friend, Samuel Comfort, was read at this time, and was as "life answering to life."

To essay replies, as way opens, to the epistles from the several Yearly Meetings with which we correspond, and produce to a future sitting, a committee was appointed.

To examine the Treasurer's account and report, a committee was appointed.

Tenth of the month, and third of the week.—The state of Society was entered upon by the reading and answering of the first and second queries.

During the consideration of them, a living exercise prevailed, and we were solemnly exhorted to remember, among all our testimonies, the deeply important one of silent worship, which it is believed at the present time is especially incumbent upon us faithfully to maintain. Among all the varied forms which men are now using, in the worship of Him who ruleth and seeth on High, we are called upon simply to wait, in silent prostration of soul, for a qualification to prepare that kind of offering which will be acceptable to Him, and if we are concerned thus in humility and introversion of spirit, to meet together, we will know the Master to be in our midst, "by the breaking of bread," even if there be but the two or three, and no vocal ministration may be heard.

We had an acceptable visit at this time from our beloved friend, Nicholas Brown.

The third and fourth queries and answers were read and considered. Much concern was expressed, that all classes amongst us may be stimulated to greater faithfulness to fulfil every duty required at their hands.

Earnest appeals were made to the daughters, never to allow themselves to consider labor of any description degrading, but be willing to engage in whatever avocation would secure an honorable support; by thus doing they will not only increase their own dignity, but strengthen their mental and physical power. If the daughters of the household were willing faithfully to perform the duties therein, much embarrassment and anxiety might be prevented.

A committee was appointed to assist the clerk

in collecting the various exercises of this Yearly Meeting, to be embodied in our extracts.

The 5th query and answers were read, and we were encouraged to remember those who require aid, and endeavor to assist them in business, and educate their children to prepare them for usefulness in life.

The sixth query and answers were read and deliberated upon, introducing us into a deep concern on account of our short-comings.

The condition of the enslaved people of color brough a deep exercise over the meeting, and a living concern prevailed that we enter into an individual examination how far we are upholding this system of oppression by using the products of their unrequited labor, and we have been encouraged to suffer no selfish indulgences to dim our spiritual vision, but as much as possible endeavor "to do unto others as we would they should do unto us." Then, whatever arises in the life, let us be willing in simplicity to do, leaving the result in His hands who alone can give the increase. A lively sympathy was also expressed for the injured Indian, who has been driven further and further till scarcely a spot remains on his native soil on which (to use his own expression) he can "spread his blanket."

We were exhorted to use moderation, not only in preparing for the burial of our deceased friends, but on all other occasions mentioned in the query.

Afternoon.—The remaining queries and their answers were read and considered, and summaries prepared.

Encouragement was given to overseers and committees, who visit offenders, that they may seek a qualification, to go in the spirit of kindness and restoring love.

The second annual query and answers were read.

The minute of last year on the subject of education was read. Also the following report from the committee on education and libraries.

Report of the Yearly Meeting's Committee on Education and Libraries.

Cash on hand 5th month, 1858, as per last report,	\$287 45
Cash received during past year—	
From Philadelphia Quarterly Meeting,	39 75
“ Upper Springfield Preparative Meeting,	1 25
“ Individual Subscriptions,	9 88
“ Byberry Monthly Meeting,	5 00
Expended during the past year.	49 94
Balance on hand,	293 39

From the *small* number of applicants the past year, we are fearful that the discouragements thrown upon the subject at our last meeting has deterred some of our young friends from availing themselves of the *opportunity of improvement* intended for them by the creation of this

fund, and which the committee have ever held themselves in readiness to furnish.

A few books are on hand for distribution. The committee will be in attendance in the entry of the Central Building at the close of the meeting on Fifth day afternoon.

On behalf of the committee,

ANN A. TOWNSEND,
JANE JOHNSON.

Philadelphia, 5th mo. 11, 1859.

The subject of the guarded education of our children is one of deep interest, and we have been encouraged to continue our efforts in aid of those who desire to qualify themselves for teachers. The committee is continued to give such attention to the subject as may be called for.

A concern was expressed that care should be observed in selecting suitable books to be used in our schools.

It was believed that a Boarding School under the care of an Association of Friends for the education of our children was greatly needed, and the subject was left under our consideration.

A desire was also expressed, that we maintain all of our neighborhood schools in accordance with the requisition of our discipline.

Twelfth of the month, fifth-day, afternoon.—Answer to the epistles from Genesee and Ohio were produced by a committee appointed at a former sitting.

The interesting subject of a religiously guarded education has again claimed our solid deliberation. Mothers were encouraged to dwell under the concern, and endeavor, more faithfully, not only to fulfil their duties at home, but place their children at schools where they may not be exposed to influences calculated to lead them from an adherence to plainness of speech and manners. A caution has been extended to our young women on account of the great extravagance manifested at social entertainments, and they have been counselled to retrench these expenses. For such indulgence is inconsistent with our profession, and often a means of involving parents in distress and difficulty.

Our testimony against the use of spirituous liquors was also revived, and mothers as well as daughters were advised to be faithful in discouraging their use at all social entertainments.

Intellectual and social enjoyments may be fully realized without extravagant entertainments, which are not only inconsistent with our Christian profession, but often wearisome; and the means thus spared may be much better applied in aiding the destitute and afflicted.

Thirteenth of the month, and sixth of the week.—Essays of epistles to Indiana, New York and Baltimore were read, and with the two yesterday, were directed to be signed by the Clerk and forwarded.

A memorial from Horsham Monthly and Abington Quarterly Meeting on behalf of our be-

loved friend, Isaac Parry, deceased, was read at this time, setting forth the life and example of a practical Christian from youth to old age.

Our annual gathering has been large, and we have been favored to transact the business which has come before us, in harmony and condescension.

A remarkable solemnity prevailed, and the solid deportment of the dear youth has been strengthening and encouraging. With grateful hearts, and desires for our mutual preservation, we conclude to meet again at the usual time next year, if consistent with the Divine Will.

Extracted from the minutes.

MARY S. LIPPINCOTT, *Clerk.*

GENESEE YEARLY MEETING.

The meeting convened on 2d day the 13th of 6th month, 1859. The representatives being called were all present except two.

Minutes for Friends in attendance from other yearly meetings were then read as follows: For Restore S. and Rhoda O. Lamb, minister from Mount Holly monthly meeting, New Jersey; Richard Cromwell, a minister from New York monthly meeting; Aaron C. Macy, a minister from Hudson monthly meeting; Daniel Comly, minister from Horsham monthly meeting, Bucks County, Pennsylvania; Jesse Roberts, an Elder and companion for Daniel Comly, from the same meeting; Elizabeth Leedom, a minister from New York monthly meeting; Sarah E. Hagan, a member from Chappaqua monthly meeting.

Epistles from the five Yearly Meetings of Friends were then read, which were interesting testimonies, containing much salutary council, and tending to brighten the chain of fraternal interest and regard, and unite us more fully in the one great cause. A committee was appointed to draft essays of replies to these salutations of brotherly love. In the report from Scipio Quarter an alteration in the Discipline was proposed, so as to release from membership those who remove to distant places from amongst Friends, and remain in such situations for one year. On which a committee was appointed, to report to a future sitting.

A memorial for Daniel Quimby, given forth from Rochester monthly meeting, approved by Farmington Quarterly Meeting and endorsed by the Representative committee, was read, and after some discussion thereon was referred back to the Meeting for Sufferings for further consideration. The representatives were desired to remain at the close of the sitting to nominate clerks for the present year.

3d day. The representatives reported they had united in nominating Caleb Carmalt for clerk, and John J. Cornell for assistant clerk, which being united with, the meeting proceeded with the consideration of the state of society as evinced by the answers to the queries.

The admonition was extended to faithfulness in the attendance of our little mid-week meetings, that by individual carefulness in this particular we may obtain the blessing promised to those who forsake not the assembling of themselves together; that as we keep the eye single to this and every other manifested duty, we shall become a people fearing God and working righteousness.

A lively concern prevailed that we endeavor to turn inward, and see whether the swift witness for truth will not condemn us for indulging in tale-bearing and detraction, then shall we be less disposed to notice the failings of others, and either pass them by, or go to our erring friends in a spirit of love.

For the lambs of the fold who have been scattered through the unfaithfulness of parents, a deep exercise was expressed, and they were encouraged to take shelter under the Divine influence, and be engaged to repair the walls that have been broken down in their own hearts. A cheering view was presented in regard to the future mission of our Society. "What people under heaven are blessed with such commandments, such ordinances, such testimonies as are entrusted to our keeping," and if we are concerned to dwell low, in that humble, watchful state in which we can discern the voice of the true Shepherd from the voice of a stranger, and in simplicity follow its teachings, we shall become as a city set on a hill, which cannot be hid, and the nations would be gathered unto us. Meetings for public worship were held in the three meeting houses in this neighborhood on 4th day, and largely attended.

5th day. The committee to whom was referred the proposition from Scipio quarter, relative to releasing from membership those who settle from amongst Friends, reported, that after due consideration, they concluded "it is not expedient to make any change," with which the meeting united. The reading of the minutes of the Meeting for Sufferings informed, that they had appointed a committee of men and women Friends to memorialize the State Legislature on the subject of capital punishment; also that they were not prepared to take any further action on the subject of the memorial for Daniel Quimby. After some discussion, "the meeting, in submission adopted the report." Epistles were produced to the Yearly Meeting, with which we are in correspondence, read and adopted, and directed to be forwarded.

It was then proposed that the Yearly Meeting next year should assemble at Pickering, Canada West, which after some consideration, and being united with by women Friends, was agreed to.

After a time of solemn quiet the meeting concluded.

If Heathens could say, "We are not born for ourselves;" surely Christians should practise it.

—Penn.

JOSEPH STURGE.

Joseph Sturge, a well-known reformer, died at Birmingham on the 14th inst. Joseph Sturge was born Aug. 2, 1793. In 1820 he established the firm of Joseph and Charles Sturge, in Birmingham, which has ever since been recognized as one of the principal corn-dealing houses in the world. His sympathies were constantly with the oppressed and the poor; but he was chiefly distinguished by his great exertions against Slavery, on behalf of peace, in opposition to the corn-laws, in the promotion of the principles of total abstinence, and in the establishment of Reformatory Schools. His first appearance in public life was in the year 1833, from which time until the final abolition of Slavery in the British dominions, he worked with Brougham, Wilberforce, Clarkson and Buxton, helping the cause with his pen, tongue and purse. Dissatisfied with the concession, and doubtful of the act which substituted the apprenticeship system for the importation of absolute slaves, Joseph Sturge, in 1837, made, at his own cost, a journey to the West India Islands, to examine for himself the state of the negro population. He collected a vast body of information, which was laid before the Parliamentary Committee and was mainly instrumental in procuring the act of Parliament by which Slavery in every form was declared to be abolished in the British dominions. Joseph Sturge afterward published a narrative of his voyage, which is still a standard authority on the subject of which it treats. In 1841, he visited the United States to examine American Slavery; and on his return published a book, which is still valuable. When the Provisional Government was established in France in 1848, he visited Paris as the guest of Arago, then Minister of the Colonies, and so forcibly did he plead the cause of the slaves that the Minister successfully exerted his influence to obtain a decree putting an end to the system. Joseph Sturge took a prominent part in every Peace Congress since that at Brussels in 1848, and went on more than one mission of peace. During the war between Denmark and the Duchies in 1848, he went first to the headquarters of the Schleswig-Holsteiners, and then to the capital of Denmark, to endeavor to persuade the belligerents to refer their disputes to arbitration. His visit to Russia in 1854 is fresh in the public mind. In 1856, he went to Paris as one of a deputation commissioned to press on the Peace Congress the importance of recognizing the principal of non-intervention; and in the same year he undertook a journey to Finland, and laboriously investigated the miseries inflicted on the wretched inhabitants of the coast by the war which was then just brought to a close. In politics, Joseph Sturge was an advanced Radical, belonging to the party of which John Bright has become the leader. He ran for Parliament several

times, but was never elected. In religion he was a Friend. The Birmingham journals add that his charity, the perfect simplicity of his character, his high honor, his sterling honesty in every relation of public and private life, and his tolerance of others' opinions, were such that it would be difficult to say whether he was more respected by his opponents or his friends.—*N. Y. Tribune.*

THE CHANNING HOME.

This institution of Boston is not a denominational institution, but will be of interest to your readers, not only because it is a worthy object in itself, but also from the beautiful illustration it affords of the power of faith and zeal in a good cause. This is an institution for "incurables," and was designed and established by the efforts of a humble and devoted woman. Her own modest spirit shrinks from notoriety, and her name is here mentioned in connection with her labors only as a holy incitement to others. Harriet Ryan is the daughter of humble parents, her father being a blaster of rocks. Early in life she heard her mother tell a person who was seeking a nurse, "she could not take care of the sick for pay, but could for the love of God." This made a deep impression on her young and receptive heart. After the death of her father, she and her sister took a humble apartment, and supported themselves by honest industry. Soon Miss Ryan became interested in a poor incurable woman, and took her to their humble room. As this was very inconvenient, upon inquiry it was suggested she might obtain the use of the Berry street Vestry, the chapel connected with the Federal street Church. But where was she to get beds and the furniture for the room. Her occupation was that of a hair-dresser for the ladies of wealth and fashion. This brought her into contact with the first circles of Boston; and while engaged in adorning their heads, she awakened their hearts by her appeals. With unassuming goodness, and a soul lighted up with holy heroism, she soon set other souls on fire. Powerful and influential friends were enlisted in the work, so that, when the Berry street Vestry was sold, it was resolved to hold a fair to raise funds for building a permanent home for the incurables. Ten thousand dollars, clear of the expenses, were raised; and now such is the interest which this devoted and heroic woman has excited that the institution has become a fixed charity. Here we have a beautiful and touching illustration of the power of a sincere and earnest benevolence. Miss Ryan, besides supporting herself, prompted by the love of God, gave the moments she could snatch from daily toil to the care and comfort of the poor and sick. Although a Catholic by conviction, she is above all narrow sectarianism. As an evidence of this, it was only

at her own earnest desire, and in deference to her wishes that the name of the "Channing Home" was given this charitable institution. By her feelings in this she recognized that holy fellowship of noble souls, which is deeper and broader than ecclesiasticalities, and which will doubtless constitute the ground of union in that higher communion of God-like souls in heaven.—*Bost. Cor. London Inquirer.*

When our right or religion is in question, then is the fittest time to assert it.—*Penn.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SEVENTH MONTH 2, 1859.

In our paper last week there appeared an account of the descent of a meteoric body in Oswego Co. N. Y. The friend who furnishes our "Items of News," waited to have the account confirmed before sending it to the printer, but in the mean time it was inserted by mistake.

We learn that several scientific men repaired to the neighbourhood, to investigate the matter, when it was discovered to be what is called a "hoax," somewhat similar to the "moon story" which deceived the public some years ago.

Any one who could take pleasure in thus imposing upon the honest and unsuspecting, should forfeit all claim to respect or confidence.

MARRIED, At Westbury, Long Island, on 5th day, 16th of 6th mo., at the residence of the bride's mother, Elizabeth P. Willets, with the approbation of Westbury monthly meeting, Isaac H. Cocks to Mary T. Willets, daughter of the late William Willets, both of Westbury.

For Friends' Intelligencer.

NATURAL HISTORY OF BIRDS.

BY YARDLEY TAYLOR.

(Continued from page 236.)

The birds of prey, or such as live on flesh, known here, are the hawk, the owl, and the bald eagle. There are several varieties of the hawk family. The broad winged hawk is a large bird, with feathers of a light color; barred across with broad stripes of ashy brown. It may be seen occasionally sailing over our fields in search of birds and small animals. They build in high trees, and make quite a large nest composed mostly of sticks. But a more active bird, and one to be more feared by the poultry raisers, is a smaller hawk with darker plumage, longer tail and more pointed wing. This is a very active bird of prey, and has been seen to catch

a tame pigeon on the wing; they are great enemies of the partridge. Both these are difficult to shoot, from their being watchful and shy of a human being. These birds are killed whenever an opportunity offers, and are dreaded by the occupants of the poultry yard, the parent hen giving her well known note of alarm the instant one of these birds is in sight. They sometimes strike and kill a fowl nearly as large as themselves, larger than they can carry off, and in this case, if unmolested, will feed upon the flesh where caught. If driven off they will watch around, and when the intruder retires, they will return after their prey. These birds are sometimes caught by baiting steel traps with a small bird or mouse, and placing it on the fence or near where they frequent. In striking at the bait they are themselves caught, and in this way their number may be thinned when troublesome. We have here a small hawk called the sparrow hawk, whose general habits are rather beneficial than otherwise. They feed on mice and small birds, and may often be seen near the barn watching for such prey. Near the rivers and large streams the fish-hawk may be seen. It is a powerful bird, with long wings, and may be observed hovering over the water watching for its prey. This practice of hovering is common to all the hawk family. They turn their heads towards the wind, and with a short quick motion of the wings they suspend their bodies quite still in the air, and are thus able to scan the surface below, and if an object of prey is seen, they descend with fearful velocity upon it, and with such force sometimes as to kill it as quickly as if it had been shot. All birds of prey have their upper bill hooked so as to enable them the better to tear flesh to pieces.

The owl is characterized by broad wings, large head and very large prominent eyes. They fly by night and cannot see so well in the day time. The common owl is nearly the color of the large hawk, with dark colored bars on a lighter ground. They frequent dark woods in the day time, and build their nests in high trees, somewhat similar to the hawk. Their eggs are nearly as large as small hens' eggs, but rounder, with faint specks of brown. They feed on rabbits, small animals, birds, and sometimes poultry, and for these latter depredations they are objected to, and means taken to destroy them. The snowy owl is sometimes, though rarely, seen here, being a bird inhabiting more northern regions. As it goes south in winter, it occasionally comes this far. Its color is nearly white, with only some faint shades of a darker hue, to be seen like spots on the feathers. Little is known of its habits here from observation; it is said to be a powerful bird of prey, and its spread of wing, and the size of its talons, give evidence of such a character. A small owl called the barn or screech owl is common here, and may often be heard in the even-

ing making a kind of whining sound, unlike any other bird. Sometimes when they have young that are just beginning to fly, if a person comes near them in the evening, the parent birds fly close around the head of the intruder, making a horrid screeching noise, which, uttered as it is, without any notes, is quite alarming, particularly to persons of weak nerves. This characteristic gives it one of its names. It is called barn owl, from being often seen around barns and other out buildings, watching for mice, on which it feeds. From its habits it is rather beneficial than otherwise, and is seldom molested. The large owl makes a loud, dismal, hooting sound at night.

The bald eagle is occasionally seen here, more often near the margin of our rivers and large streams than elsewhere. It sails and hovers over the fields searching for small animals and birds, and sometimes will attack a young lamb. He is fond of fish, but is himself a poor fisher. This kind of food is more often obtained by robbing the fish hawk, than by his own individual exertions, showing a tyrannical disposition, the opposite of magnanimity. The naturalist Wilson, in his Ornithology, gives a most beautiful and eloquent description of the bald eagle, in his contest with the fish hawk. He represents the eagle as sitting on the top of some old tree near the shore, careless of the movements of the crow and other birds around him; but the moment the hover of the fish hawk is seen, he is all attention. Presently the hawk having descried a fish, descends swift as an arrow, dashing the spray in all directions, and soon is seen rising, struggling with his prey. Now is the time for the eagle; and pitching from his perch, he instantly gives chase. The hawk, if unincumbered, could readily escape, but as it is, the eagle gains upon him, each rising to keep above the other, thus performing some splendid aerial evolutions. The eagle finally comes close, and is about to attack, when the hawk, having no other resource, drops its prey with screams of honest indignation. The moment this is seen, the eagle whirls downward, and strikes the fish before it reaches the water, and bears it away and devours it at its leisure. They sometimes kill the wild duck for prey. They make a pitch at this bird while swimming, which instantly dives out of reach, but has to come to the surface again; when a similar attempt is made with the same result, and in this way the bird becomes fatigued, and is driven into shallow water near the shore, where it is finally struck and killed. The eagle builds a large nest in high trees, and, it is believed, the same pair occupy the same nest for several years in succession. The picture of the eagle has been adopted as the emblem of our country, and from its rapacious habit of living on the labor of other birds, was objected to by some sensitive minds; but taking things as they are now, the desire of

acquisition manifested by our government, and the filibustering disposition manifested by many in high places, it seems to be a most appropriate emblem.

There is a summer bird here called the night hawk, but which does not belong to the hawk family; it is a true fly-catcher, living upon the insects in the air. This bird is about the size of a dove, with much larger wings. Its color is quite dark, mixed with small spots of white, with two larger spots of white on each wing that show conspicuously while flying. It is a shy bird, seldom seen except on the wing, and many times may be seen in considerable numbers in the evening, flying leisurely about, and often making sudden changes in its course, either upward, downward or sideways, as if catching insects on the wing. They have broad mouths, as all fly catchers have. They practise one curious manœuvre that no other birds are known to do. A pair of them may be observed flying about, when one will begin to ascend by using his wings rapidly a short time, then fly leisurely as if resting, then repeat the upward movement again and again, until having gained a height of one or two hundred feet above his comrade, bending his wings into a curve, and turning his head downward, he descends with great velocity without changing the position of his wings, and passes close by his companion, making at the time a loud boing sound, that can be heard a considerable distance; then he describes a curve upward, still with his wings bent, and from the velocity acquired in the descent, rises a considerable height without further effort. This manœuvre is often repeated, but always in company with a bird of the same kind. Whether it is the action of a gallant to show himself off before his lady-love, we must leave; at any rate it would seem about as rational as the manœuvres of some other birds on similar occasions.

Another bird, of similar size and color to the foregoing, is the Whip-poor-will, so called from its habit of repeating those words. Some have supposed them identical, but the best informed consider them distinct. They too, are shy birds, being seldom seen; and living in woods and forests, and laying their eggs on the ground without any preparation of a nest. At night they select a place, and will repeat the sound of whip-poor-will for hours together, at the rate of two or three times a minute. They have been known to come near a house every night at the same place, and continue their song. They are looked upon by some with a feeling of superstition.

The turkey buzzard, is seen here at all seasons, but most numerous in summer. It is a large bird with broad wings, and is rather sluggish. Its head is partly red like the turkey, and covered with scattered hairs instead of feathers. Its bill is strong and hooked like other birds that

feed on flesh. The color a dark brown, nearly black. They are serviceable as scavengers, as they feed upon dead animal matter, and thus remove what would become offensive. Their sense of discerning where dead animals are to be found is truly remarkable, and seems so far beyond any sense of sight or smell that we are acquainted with, that it is difficult to account for the facts that sometimes occur. My father, many years ago, had a horse that died, and the body was taken into the woods, and there opened to discover the cause of death. Within two hours after, a number of buzzards arrived there from all directions; many of them must have come from a distance of miles, as they were seen coming as far as our eyes could discern them, and as they were large and high in the air, they could be seen a long distance. They came in as direct a line towards the carcass as if they had been guided by the mariner's compass, and continued to do so the greater part of the day, until there were probably hundreds of them collected. This could hardly be by eyesight, as the carcass could not be seen far, it being in the woods. And to suppose they were guided by the effluvia from the dead body so soon after death, would argue a sense of smell that we can have but little conception of; and yet this was probably the case. They build their nests on high inaccessible rocky cliffs, where they are secure from intruders. They may be seen at Harper's Ferry, on the Potomac river, a all times during summer.

These birds fly with less apparent effort than any other. They sail with outspread wings, rarely giving them any motion, except when rising, and even then but little. It is difficult to see how they are propelled with so little effort. We know that velocity, once acquired, would enable a bird to sail some distance, more particularly if descending, but the buzzard will sail for hours, scarcely moving its wings and gradually rising at the same time. In some of the Southern States they are protected by law, and not allowed to be killed, and, indeed, in most places they are seldom interfered with, their benefit being acknowledged.

Wild ducks frequent our rivers, and in the spring are sometimes seen in the mill ponds out in the country, but their stay is generally short, as they do not breed there. There are many varieties of them, some of which are extremely beautiful. In our tide-water rivers they are very numerous, breeding in the marshes along the shore. Some of the varieties known seem to be birds of passage, and go north in the spring. The canvass-back duck, so highly prized by the gastronomics, is met with even far within the polar circle, but it is said that it nowhere attains to that peculiar flavor of its flesh, that it does in the waters of the Chesapeake bay and its tributaries. This is said to be owing to a plant peculiar to those waters, on the roots of which this

duck feeds. This plant is a species of wild celery. Many persons make a business of shooting ducks for market, and sending them to the northern cities; and since the introduction of steam ships across the Atlantic, the canvass-back is frequently sent to Europe. The name is derived from the color of the feathers on the back, resembling coarse canvass. There are many other varieties of the wild duck that are good for the table, but none with so high a repute as the canvass-back.

(To be continued.)

HUMBOLDT.

On the 6th of May, in the city of Berlin, Alexander Von Humboldt died, at the age of ninety years.

Few, if any, possessed so varied a range of attainments; no one ever used vast knowledge more nobly than he. The sciences—astronomy, chemistry, geology, mineralogy, natural history, physics, anatomy—were not more familiar to him than politics, law, and belles lettres; in all he was a master. Whether we consider the sum of his additions to the general stock of known facts, or the valuable generalizations and laws which he deduced from the discoveries of others, we shall find it difficult to name any philosopher of the present day who can be compared to him.

He was born at Berlin on September 14, 1769; his father was a soldier of distinction and a man of wealth. Left fatherless at the age of ten, Fredrich Heinrich Alexander—this was his name—was carefully educated by judicious relatives, and spent a creditable career at the universities of Berlin and Gottingen. His taste for scientific pursuits led him to devote especial attention to geology and mineralogy; and, after a couple of years' study at Fribourg, he became, at the age of 23, a director of the works at Baireuth. He had previously travelled extensively through Germany, Holland, and England, and published a small work on the basaltic rocks on the Rhine. His labors at Baireuth increased his love for science: he made himself master of all that was then known of chemistry, galvanism, botany, and geology, and the death of his mother placing him in possession of independent property, he sold his estates, threw up his situation, and determined to devote himself to science.

Having decided to choose a new field for his observations, he was somewhat embarrassed in his selection. War was raging throughout Europe at the time. He proposed to explore scientifically Southern Italy, and actually set out with a friend; but the British cruisers compelled the relinquishment of the enterprise. He planned a tour through North Africa, and got as far as Marseilles; but the war again interfered, and he abandoned the project. He had met at Paris the late M. Bonpland, then appointed naturalist to a scientific expedition to South America; but

the war put a stop to this too. Almost in despair, he and Bonpland resolved to devote themselves to a series of scientific experiments and observations in Spain and left France accordingly. While in Spain the Government of that country became acquainted with Humboldt's extraordinary attainments, and anticipated his fondest hopes by soliciting him to undertake the exploration of Spanish America. It need not be added that the offer was joyfully accepted.

On June 4, 1799, Humboldt sailed from Corunna on his great voyage. Even to give a brief summary of the result of his five years' journeyings would exhaust far more than the space allotted to this sketch. It must suffice to say that, having touched at Teneriffe, and obtained some valuable observations of and from the Peak, the illustrious traveller landed at Cumana, in the middle of July, and devoted eighteen months to a thorough exploration of the wilderness which now constitutes the State of Venezuela, laying down the true course of the Orinoco and other rivers, and collecting the materials for an accurate account of the physical geography of that section of country. From thence he went to Cuba, travelled over the island, and made so thorough an examination of its resources and peculiarities, that his work on Cuba, old as it is, is the most valuable we have. In March, 1801, he left Cuba for the main land, intending to make Panama his starting-point. Accident drove him further south. He made Bogota his point of departure, and from thence, in spite of the rainy season, crossed the Continent to the Pacific, and carefully surveyed Peru, Chili, and the whole Pacific slope of the Andes. It was during this tour that he made his famous ascent of Chimborazo; he attained an elevation of 19,300—over three miles above the level of the sea; and amidst mists and cold so intense that the blood started from his eyes and ears, planted his instruments on a rock which the wind had bared of the eternal snows, and enriched science with an unprecedented series of observations. In Chili he was enabled to study the phenomena of earthquakes, as, in Venezuela, he had studied meteoric showers; his views on these important subjects have never been controverted. After spending twenty-two months in South America, he repaired to Mexico, visited its great volcanoes, laid down the course of several of its rivers and mountain ranges, and obtained a thorough knowledge of the country. From Mexico he sailed by way of Havana, to Philadelphia, and spent a couple of months in this country; from whence, at length, in July, 1804, he sailed for France, with the fruits of five years' indefatigable and intelligent travel—such a store of facts, drawings, and observations as no previous traveller had ever been able to collect.

Some idea of the value of his American harvest may be gathered from the fact that his pub-

lished account of his travels in South America and Mexico comprises seventeen volumes folio, and eleven volumes quarto, and costs \$2000 a copy. It took him twelve years to write.

After the completion of this gigantic labor he travelled through parts of Italy which he had not seen, and spent some time at Rome at the villa of his brother Wilhelm. He was enabled to witness a great eruption of Vesuvius, and obtained some valuable observations. In 1818 he finally took up his residence at Berlin, where he was eagerly welcomed by the King and Court as well as by the savans. The Prussians were so proud of him, and so fearful of losing him—strong inducements were held out to him to settle in France—that he was made a councillor of State, and given to understand that no favor would be too great for him to ask. He had no political ambition, however, and was happy in being able to prosecute his studies.

In 1829 the Emperor of Russia resolved to have a survey made of his Asiatic possessions, and offered Humboldt the direction of the work. The offer was accepted, and in company with two distinguished savans, Humboldt traveled through Siberia and Tartary, spending nine months in collecting ample material for an account of the physical geography of Central Asia. His travels were published by the Russian Government in a magnificent form, and at his suggestion a series of observations were undertaken which have been of great use to science. Nicholas would gladly have retained Humboldt in Russia, but found him inflexibly attached to his native land. On his return home Humboldt found the revolutions of 1830 in progress, and filled his first diplomatic part by going to Paris, on behalf of Prussia, to recognize Louis Philippe. He was much occupied then and for some years afterwards in political concerns. With the King of Prussia he lived on terms of almost brotherly intimacy; and though his political opinions were much too liberal for his sovereign—he was, in fact, a thorough republican—he represented Prussia faithfully and honorably on several momentous occasions. The crisis of 1848 is said to have led to some decided expression of his liberal views, and for a time to have estranged him from his royal friend, but the separation was brief—the King was a very good man at bottom, and meant well—he could not live without Humboldt, who, for his part, was so much engrossed with scientific concerns as to be rarely anxious about politics.

Shortly after his return from Russia he planned his *magnum opus*, which, he intended, should contain the sum of his acquirements, and should demonstrate the harmonies of the universe. To this great work he gave the appropriate title of "Cosmos"—the World. He began it in 1831; but for a long period the work was interrupted, and the first volume did

not appear till many years afterward. The fifth was published shortly before his death. The work is so well known as to need no description here. It is enough to say of it that it contains the sum and reason of the knowledge of the most comprehensive mind of the present age.

The problem he sought to solve—the demonstration of the perfect unity of the divine purpose, and the harmony of all the divine laws—has not been solved, because all science is yet in infancy, and the sum of what we know is small in comparison with that which we have yet to learn. But any one who wants to know how much the human mind grasps, and how far the human eye has groped into the mist of knowledge, will find what he seeks in "Cosmos."

One of the most striking characteristics of Humboldt was the remarkable quickness with which he turned every thing to good account—even accidents and disappointments. Every man was for him a teacher of something; every object a theme for study; every event a new problem solved, to be stored away in the proper shelf in his capacious mind. Tuckerman says of him; "If delayed by the event of war from embarking on his American expedition, he occupied himself in ascertaining the height of the central plains of Castile; when becalmed on soundings, he examined the weeds collected on the lead to gain new light for the theory of the coloring of plants; the haze that for many hours concealed from his sight the Peak of Teneriffe induced ingenious speculations on the effects of atmosphere on vision." Our countrymen, Mr. Squier, who visited him at Berlin, thought, after a few hours in his company, that the rapacious *savant* had pumped him dry about Central America; but he was mistaken, for, before his departure, an urgent note reached him from Humboldt imploring him to say whether the potato disease had ever existed in Nicaragua!

Between Americans and Humboldt there always existed a strong bond of sympathy. His early travels; the respect shown him on his visit to this country; his republican opinions, and his intimacy with some of our greatest men, always led him to feel a strong affection for the United States, and to show to American travellers more attention than to foreigners generally. It is not enough to say that his regard was reciprocated by the American people. No foreigner enjoyed such general veneration in this country as Baron Humboldt. The proposal which was made to leave the Oregon dispute to his arbitration was one of the many evidences of the unexampled esteem in which he was held on this side the water.—*Harper's Weekly*.

A neuter only has room to be a peace maker; for being of neither side, he has the means of meditating a reconciliation of both.—*Penn.*

OUDEN,

An Original Poem furnished by a Friend.

When the hazy midnight vapor,—
Dream-land's weird, mysterious light,—
Floats about my dying taper,
Clouds my brain, and dims my sight;

Gradually—gently, doth volition
From my meditations steal,
And my thoughts, without suspicion,
Make their own creation real.

And my Reason, growing fainter,
Fails its warning word to say,
When the fire-light phantom painter
Pictures round me ghost and fay.

Spirits seem to float in ether,
Forms seraphic fill the air,
Truants from the shores of Lethe
Come my lonely watch to share

Soon my frenzied soul rejoices,—
Half in wonder, half in fear—
At the sound of unreal voices,
Whispering strangely in mine ear.

Soothing words they fondly murmur,
Gently calm my mental strife,
Till my faltering voice grows firmer
And I ask them, *What is Life?*

Then they form in glowing column,
Standing silent, all but three;
These in accents grave and solemn,
One by one do answer me.

Sensual Pleasure's shadowed effluence
First responds in whispers low;
While his passions' cheerless reflux
Ever turns his voice to woe.

"Life is but an empty bubble,
Filled with nothing—bursting—gone;
All this world's a vale of trouble,
Cheered with scarce one sunny lawn.

Live! Live! in the passing moment,
And away with dull old books;
He doth borrowed troubles foment,
Who beyond the present looks."

Then a second spirit brother,
Still of sad and sombre sort,
Yet more hopeful than the other,
Thus succeeds with dark import;

"Life's a rushing, mighty river,
Joyous, melancholy, grave,—
Now the ripples, sun-gemmed, given,—
Now the tempest rides the wave.

Some are whirling in the eddy,
Circling, helpless, down to death;
Some are walking, calm and steady
On the water strong in faith."

Lastly speaks a saintly shadow
Radiant with celestial light;
Gems from golden El Dorado
Shine not purer on the sight.

"Life is *not* a river, flowing;
Life is *not* a bubble, frail;
Never man was blest with knowing
More of Life than creeping snail.

What then though thy feeble vision
May not Being's essence scan;
Enough for thee, is this decision;
Life is what it's made by man;

Rouse thee, then, thou dreaming sleeper !
 Cheer thy heart and nerve thy arm ;
 See ! a harvest waiting reaper,
 See ! a labor to perform.

Dote no more on idle fancies,
 Yielding but a transient sweet ;
 Where the ignis fatuus dances,
 Treacherous fens betray thy feet.

Tread the path that's straight before thee,
 Onward to a constant goal ;
 Guided by a pole-star o'er thee,
 Bright reflected in the soul.

Make of Life a working pleasure,—
 Always earnest,—always bright ;
 In thy hours of pensive leisure
 Find some sanctified delight,

Gentle sadness in th' Eleyson,
 Music where the rain drops fall,
 Grandeur in the broad horizon,
 Love the reigning queen of all ;

Bow thee at her hallowed altar,
 There each morn an offering bring,
 Chant thy vesper from her psalter,
 And in dreams her praises sing.

Rough may be thy path, and lowly,
 And, at times, by sorrow crossed
 But the Life that's pure and holy ;
 Never, never can be lost.

For the wavelets surge not vainly
 On remotest island shore,
 Father Time is tracing plainly,
Man departs forevermore ;
 Yet our mem'ries cherish mainly
 Lowly spirits gone before."

WOMEN AND WORK

BY BARBARA LEIGH SMITH BODICHON.

Professions want Women.

(Concluded from page 239.)

"Certainly it would make unmarried women happier to have professions. But is it not discouraging to give a girl a training for a trade when we know that if she marries she will most surely give it up? She must, you know, if she has children, and nine out of ten women do marry and have children."

Taking your statement as true, which, by-the-by, it is not, (for, of women at the age of twenty and upwards, 43 out of the 100 in England and Wales are unmarried,)* we can answer that it is worth while.

1st, A girl will make a better wife for having had such serious training. 2dly, Your daughter may not marry. It is your duty to provide for that possibility; and she will surely be ill, miserable, or go mad, if she has no occupation. 3dly, It may be years before your daughter finds a husband. It is your duty to give her

worthy work, or allow her to choose it; and certainly she is more likely to be attractive and to get a good husband if she is cheerful and happy in some work, than if she, being miserable and longing for a change, clutches at the first offer made her. 4thly, Suppose the man she may love is poor, by her labor she can help to form their mutual home. Birds, both cock and hen, help one another to build their nest. 5thly, Your daughter may be left to act as both father and mother to children dependent on her for daily bread.

But is it certain that a girl will give up her occupation when married? There are thousands of married women who are in want of a pursuit—a profession. It is a mistake to suppose marriage gives occupation enough to employ all the faculties of all women. To bring a family of 12 children into the world is not in itself a noble vocation, or always a certain benefit to humanity. To be a noble woman is better than being mother to a noble man; and also the best way of accomplishing that great work!

Christ was teaching noble truths in inspired language: a poor Jewish woman standing in the crowd, listening eagerly, and carried away by his divine eloquence, burst out into this exclamation: "Blessed is the womb that bare thee, and the paps which thou hast sucked." I can imagine Christ, as she began to speak, looking hopefully towards her thinking a new worker for the truth had sprung up, and then, as he heard the words, dropping his eyes to the ground disappointed. "But he said, Yea: rather blessed are they that hear the word of God and keep it." The woman's words are pitiful and touching, as they let us into the whole object and destiny of women's lives in the East, and they have been repeated with variations in all countries and all succeeding ages. While Christ's simple straightforward answer, cutting direct at the root of the matter, has been very little marked or understood.

Are there not quite enough women carrying on business, professions, different works after marriage, to prove that it is possible, and much for the benefit of husbands and children? It is absurd to look to remote consequences and possibilities; all we can do is to walk straight on the little bit of way we see clearly with our foggy vision. If it be right for girls to ask for work, give it to them. If your daughter says, "Teach me a trade," you have no right to refuse her. She may have to earn her own living; and hard indeed will be the struggle, if, with no training, no habits of work, she enters into competition with the skilled workers of the world, and those who have habits of hard application. Every human being should work; no one should owe bread to any but his or her parents. A child is dependent on its parents for bread as a child: idiots and imbeciles must be fed all their lives; but rational beings ask nothing from their parents

* And a very large proportion in New England also, probably 30.

save the means of gaining their own livelihood. Fathers have no right to cast the burden of the support of their daughters on other men. It lowers the dignity of women; and tends to prostitution, whether legal or in the streets. As long as fathers regard the sex of a child as a reason why it should not be taught to gain its own bread, so long must women be degraded.

Adult women must not be supported by men if they are to stand as dignified rational beings before God. Esteem and friendship would not give nor accept such a position; and Love is destroyed by it. How fathers, knowing men, can give up their daughters to be placed in such a degrading position, is difficult to understand. Human nature is better than human institutions; and there is, in spite of all the difficulties and dangers, a good deal of happiness in married life. But how much misery that might be prevented! Women must have work if they are to form equal unions. Work will enable women to free themselves from petty characteristics, and therefore ennoble marriage. The happiest married life we can recall ever to have seen is the life of two workers, a man and a woman equal in intellectual gifts and loving hearts; the union between them being founded in their mutual work.

Women who act as house-keepers, nurses, and instructors of their children, often do as much for the support of the household as their husbands; and it is very unfair for men to speak of supporting a wife and children when such is the case. When a woman gives up a profitable employment to be governess to her own family, she earns her right to live. We war against idleness, whether of man or woman, and every one is idle who is not making the best use of those faculties nature has given him.

How often dreary years of waiting for marriage might be saved by the woman doing just so much work as would keep her soul alive and her heart from stagnation, not to say corruption! We know an instance, a type of thousands. B, a young man, was engaged to M; they were both without fortunes. B worked for years to gain enough money to marry upon. M lived as young ladies usually do—doing nothing but reading novels and “practising.” She became nervous, hysterically ill, and at last died of consumption. B, overworked and struck with grief, became mad. I could add a score of such cases. Ask medical men the effects of idleness in women. Look into lunatic asylums, then you will be convinced something must be done for women.

Think of the noble capacities of a human being. Look at your daughters, your sisters, and ask if they are what they might be if their faculties had been drawn forth; if they had liberty to grow, to expand, to become what God means them to be. When you see girls and women dawdling in shops, choosing finery, and talking

scandal, do you not think they might have been better with some serious training?

Do you think women are happy? Look at unmarried women of thirty-five—the prime of life. Do you know one who is healthy and happy? If you do, she is one who has found her work:—“Blessed is he who has found his work; let him ask no other blessedness.” “Oh! If I had anything to do, I could bear this grief,” said a girl whose lover, was just dead. Another, living only in her lover who was a sailor, saw a false statement in a newspaper, that he was drowned—she lost her reason instantly, and never recovered it.

We do not say that if she had been a medical student or a watchmaker, that the grief might not have turned her brain, but most certainly she would have had a stronger and a stouter reason, and some cause to wish to live. It is a noble thing even to make good watches, and worth living for.

Women should teach languages and oratory. Aspasia taught rhetoric to Socrates. The voice of women is more penetrating, distinct, delicate, and correct in delivering sounds than that of men, fitting them to teach both oratory and languages better.

All the work of philanthropy is imperfect unless women co-operate with men.

When we are down in the strong black tide of ignorance and misery in Westminster or St. Giles, we exclaim—

“Oh, that we now had here
But one in ten thousand of those women in England
Who do no work to-day!”

And so in all places might we say, if women were but fitted to the work.

Great is the work to be done in the world, but few are the skilled laborers.

Two Fallacies.

It seems hardly worth while to say that there is a prejudice against women accepting money for their work. But there is one; therefore it is as well to say a few words upon it.

Money is only a convenient representative of desirable things. It would be well if all should part with what they make, or what they do well for money; they will then know that some really want what they produce. What they produce will go to the right people, and they, the producers, will gain a power; for money is a power. Money may be a power to do good. If for your needlework you get money, you know that your work goes to some one who wants it. You are not always sure of that if you give it away; and you gain a power of sending a child to school, of buying a good book to lend to the ignorant, of sending a sick person to a good climate, &c. We may give this power up to another whom we consider can use it better than we, but money is a power which we have not the right lightly to re-

ject. It is a responsibility which we must accept.

Of course, we may give our labor, our work, our money, where we think right; but it is as well to exchange them sometimes for money, to be sure we are as valuable as we think. Some work is beyond all price, and many prices are far beyond the value of the works.

Most of the work of the world must be done for money. It is of the utmost importance to make that work "stuff o' conscience." To make all work done for money honorable, is what we should strive for. To insist on work for love of Christ only, to cry up gratuitous work, is a profound and mischievous mistake. It tends to lessen the dignity of necessary labor; as if work for daily bread could not be for love of Christ too! Well-done work is what we want. All work, whether for love or money, should be well done; this is what we should insist upon.

Another common fallacy:—It is often said that ladies should not take the bread out of the mouths of the poor working-man or woman by selling in their market.

The riches and material well-being of the country consist in the quantity of stuff in the country to eat and to wear, houses to live in, books to read, rational objects of recreation and elevation. Any one who puts more of any of these things into the country, adds to its riches and happiness. The more of these things, the easier is it for all to get. Do not think of money until you see this fact. This is why we bless steam engines; this is why we would bless women. Steam-engines did at first take the bread out of a few mouths, but how many thousands have they fed for one they have starved!

Concluding Remarks.

One of the practical impediments in the way of women working is the inconvenient modern dress, which is only suited to carpeted rooms, where it appears graceful and proper; in the streets it is disreputable, dirty, and inconvenient. As long as women will not get out of their "long clothes," they deserve to be treated as babies. There are signs that the

—"just medium will be found

A little lower than the knee, a little higher than the ground."

The ladies of the English aristocracy, when they lead an active life in the country, do not go about with draggle-tail petticoats, like the working-women in our towns, but in short petticoats, thick-ribbed, brown, blue, or barred stockings, and solid Balmoral boots.

How many girls are prevented from continuing their attendance at school, college, workshop, atelier, by colds caught from going without proper waterproof clothing, and stout shoes or boots!

To sum up. Women want work both for the health of their minds and bodies. They want it

often because they must eat and because they have children and others dependent on them—for all the reasons that men want work. They are placed at a great disadvantage in the market of work because they are not skilled laborers, and are therefore badly paid. They rarely have any training.

All experience proves that the effect of the independence of women upon married life is good.

The time has arrived when women are wanted in the Commonwealth. John Milton said the Commonwealth "ought to be but one huge Christian personage, one mighty growth and stature of an honest man, as big and compact in virtue as in body." Our idea differs from this grand but incomplete conception. We rather think the Commonwealth should be—

"Inclusive of all gifts and faculties

On either sex bestowed, knit up in strengths

Of man and woman both: hers even as his,

And tempered with the finest tenderness

Of love betwixt these two."

Many have sneered and sneer at women entering professions, and talk of the absurdity of their being in the army, mixing in political life, going to sea, or being barristers. It is not very likely many women will enter these professions; women will rather prefer those nobler works which have in them something congenial to their moral natures. Perhaps we may say that women will only enter those professions, which are destined to be perpetual, being consistent with the highest moral development of humanity, which war is not.

The arts, the sciences, commerce, and education of the young in all its branches—these will most strongly attract them.

REPARTEE.

The following anecdote is told of Dr. W. S. White of Lexington, Virginia, and Speaker Orr, at a meeting of these gentlemen at the Warm Springs, Virginia:—"They had been sitting with other company in a public room of the hotel, and after a while the doctor rose and walked across the room with the usual limp in his gait. Orr immediately recognized him, and asked him if he was not the chaplain at the University of Virginia at such a time, naming the year. The doctor replied that he was. "I was there," said Orr, "a student at the University, and I knew you by your limp." "Well," said the Doctor, "it seems my *limping* made a deeper impression on you than my *preaching*." The joke placed Orr in an awkward predicament, and most men would have been unable to extricate themselves; but he replied with ready wit: "Ah, doctor, it is the highest compliment we can pay a minister to say he is known by his *walk*, rather than by his *conversation*!"

ITEMS OF NEWS.

The Boston papers announce the death in that city of John Augustus, a gentleman long and well known in Boston in connection with his benevolent exertions in behalf of poor criminals, the latter years of his life being almost entirely spent in ameliorating their condition by becoming bondsman for their good behavior, and providing means and opportunities that would tend to a reformation. Possessed of a living income from means accumulated in business pursuits, the deceased was in a position to carry out the dictates of a generous heart, and those who know him best give him credit for sincerity of purpose and great usefulness.

DEATH OF A DISTINGUISHED INVENTOR.—Among our recent notices of deaths we find that of Walter Hunt. For more than forty years he has been known as an experimenter in the arts. Whether in mechanical movements, chemistry, electricity, of metallic compositions, he was always at home; and probably in all, he has tried more experiments than any other inventor. He originated the sewing machine, spinning flax by machinery, the first nail machine, the first machine for cutting brads by one operation, placing plugs in leather for soles of boots and shoes, a method of constructing docks by concrete, preparing a paper pulp so as to form boxes by one operation, the vapor baths, printing by rollers instead of balls, and so many other things our space will not admit of details. Walter Hunt, like most inventors, devoted his life to his friends rather than himself; was liberal to a fault, and none knew but to love him; numberless experiments kept him always poor. He lived to the age of 63 years, in full vigor until the last four days of his life.

DOROTHEA DIX is now visiting the prisons of Illinois. She is making a general tour through the South and West.

ICE.—The ice business of Lake Pepin, on the Mississippi, the past Winter, has been one of great importance. Over 6,000 tons were put up at various points on the lake, the value of which will not be less than \$60,000.

TELEGRAPH.—It is stated that the prospectus of a company will soon be issued for laying two telegraph cables from Cornwall, England, to Canada direct, and that the proposed capital of the company was half a million sterling.

GERMANY.—The feeling in some of the States of Germany against the French is so strong that a French manufacture at Hesse Cassel, employing 700 workmen, has been compelled to quit the place on account of the excitement prevailing.

AFRICA.—The English papers announce the arrival home of Capt. Burton, the famous Arabian and African traveler, who has made some wonderful discoveries in the interior of Africa, and who is the only European who ever visited Mecca, the sacred city of the Mohammedans, without disguising his religious faith, and escaped with his life.

DISCOVERY.—A surprising discovery has just been made in Berlin. Dr. Pertz of the Royal Library, has ferreted out the manuscript Journal of two Genoese navigators, Theodosia Doria and Ugolino Vivaldi, who succeeded in sailing round the Cape of Good Hope in 1290—that is 207 years before Vasco de Gama.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Market is dull. Receipts of Flour continue light, and prices are rather lower. Sales of good superfine are reported at \$6 62 a \$7 00 for common extra. Good Western extra at \$7 25. The sales to the home trade are limited between

\$6 62 and \$8 00 for fancy lots. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 50 and the latter at \$3 88 per barrel.

GRAIN.—Wheat is dull and without demand. Sales of Pennsylvania and Western red at \$1 60 a 1 69, and white at \$1 70 a 1 75. Rye is selling at 90 c. Corn is dull, and prices drooping. Sales of yellow at 82 cts., afl oat. Oats are dull and plenty. Sales of prime Delaware at 46 cents, and Pennsylvania at 47 cents. In Buckwheat there has been a further decline. The Sales yesterday were at 75 cents.

CLOVERSEED comes forward slowly, and prime lots command \$5 25 per 64 lbs. Timothy has declined to \$2. Flaxseed is scarce.

A well qualified teacher is wanted to take charge of Darby Monthly Meeting School. Application can be made for further information to

RACHEL T. JACKSON OF
M. FISHER LONGSTRETH
Darby P. O. Penn.

6th mo. 1st, 1859.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address

WM. HICKLEN,
Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,
Cheap School Book Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks.

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.

4th mo. 9—3m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SEVENTH MONTH 9, 1859.

No. 17.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS TWO SONS.

BY SAMUEL M. JANNEY.

On the Divine Being.

(Continued from page 226.)

John. Although I acknowledge that William Penn was a great and good man, I cannot take his expressions as sufficient authority; I look to a higher source, even to the scriptures of truth, for evidence on this important question. Now, the scriptures appear to me to speak of the Deity in a threefold sense:—first, as the Creator and Father of all; secondly, as the Son, who is the mediator between God and man; and thirdly, as the Holy Ghost, who is sent by the Father and the Son, to sanctify the heart and regulate the affections. Yet it is repeatedly said in the Old and New Testament, that God is one; therefore, we conclude that there are three persons in one God,—each of which persons is perfect in himself, possessing omnipotence, omniscience, and eternity; the “same in substance, equal in power, eternity, and glory.” (See Westminster Confession.) I shall now endeavor to prove these positions by passages from scripture.

1st. That there is *more than one* person in the Godhead, may be inferred from the following texts: “God said, let *us* make man in *our* image, after *our* likeness.” Gen. i. 26. “And the Lord God said, the man has become as one of us, to know good and evil.” Gen. iii. 26. And the prophet says, “I heard the voice of the Lord, saying, whom shall I send, and who shall go for *us?*” Is. vi. 8. We are also informed by learned men, that the name most commonly given to the Deity, in the Old Testament, is Elohim, which is a plural noun; and this has been considered a

strong proof that there is a plurality of persons in the Godhead.

2d. That the number of persons in the Deity is three, may be concluded from the words of our Lord, who said to his disciples, “Go ye, therefore, and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost.” Mat. xxviii. 19. And also from the benediction of the apostle Paul, who says, “The grace of our Lord Jesus Christ, and the love of God, and the communion of the Holy Ghost, be with you all.” 1 Cor. xiii. 14.

3rd. We argue that each of these is, in some sense distinct, because one is represented as the Father, who sends; another as the Son, who is sent into the world; and the third as the Spirit, that was poured out upon all flesh. The Father and Son are also represented, in many places, as speaking to each other, which shows that they must be distinct from each other, in one sense, although forever united in another. Now, I think it may be proved that each of these persons is Divine, and consequently co-eternal and co-equal. That the Father is omnipotent, omniscient, and eternal, will, I suppose, be admitted without argument. That the Son is so, may be shown from the introduction to the Gospel by St. John. In the beginning was the Word, and the Word was with God, and the Word was God. The same was in the beginning with God. All things were made by him, and without him was not any thing made that was made.” Ch. i. 2. “And the Word was made flesh and dwelt among us, (and we beheld his glory, the glory as of the only begotten of the Father,) full of grace and truth.” ver. 14. There are many other texts of similar import, but I shall quote only one more, which I consider sufficient. St. Paul says, “God, who at sundry times, and in divers manners, spake in time past unto the fathers by the prophets, hath in these last days spoken unto us by his Son, whom he hath appointed heir of all things, by whom also he made the worlds; who being the brightness of his glory, and the express image of his person, and upholding all things by the word of his power, when he had by himself purged our sins, sat down on the right hand of the Majesty on high.” Heb. i. 1–3.

That the Holy Ghost is not only Divine, but personally distinct from the others, may be inferred from the operations assigned to them being generally different. He is represented as the

baptizing power; Christians are also said to be born of the Spirit: and Christ promised his disciples, "I will pray the Father, and he shall give you *another Comforter*, that he may abide with you for ever, even the Spirit of truth." John xiv. 16.

4th. Having shown from scripture that there are three persons in the Deity, it only remains to be proved that Jesus Christ is the second person, or Logos, mysteriously united to "a human body and rational soul," and born of a virgin; and this has been called the hypostatical union. This may be proved from many passages. It is said, "He *took* not on him the nature of angels, but he took on him the seed of Abraham; wherefore, in all things it behoved him to be made like unto his brethren, that he might be a merciful and faithful high-priest, in things pertaining to God, to make reconciliation for the sins of the people; for in that he himself hath suffered, being tempted, he is able to succour them that are tempted." Heb. ii. 16-18. He is also called "God manifest in the flesh." 1 Tim. iii. 16. "God with us." "The Lord of glory." 1 Cor. iii. 8. And, "over all, God blessed for ever." Rom. ix. 5. That he had a human soul, as well as a human body, is very clear; for he says, "My soul is exceeding sorrowful, even unto death." Yet his human nature must not be confounded with his divine; for, though there be an union of natures in Christ, yet there is not a mixture or confusion of them or their properties. His humanity is not changed into his Deity; nor his Deity into his humanity; but the two natures are *distinct in one person*. How this union exists is above our comprehension; and indeed, if we cannot explain how our bodies and souls are united, it is not to be supposed we can explain this astonishing mystery of "God manifest in the flesh." (See Buck's Theo. Dict. article Jesus Christ—also, Smith's Treatise on the Trinity.)

Father. Those who profess to derive their doctrines entirely from the scriptures, ought to be very careful to keep to the language of scripture, especially when speaking on a subject that they do not pretend to understand. If the doctrine of a trinity be taught in the scriptures, it must be conveyed by inspiration in the very best language which could be chosen; and there is no need of *inventing new terms* to express it. But we do not find any such term in the scriptures as a trinity; nor is it said that there are three persons in the Godhead; nor is there any language there conveying the same ideas. I therefore conclude, that this doctrine is an invention of men; and it must be acknowledged by every reader of history, that it has been one of the principal causes of dissension and persecution ever since it was introduced into the church. If we take the word *person* in its common acceptation, it means an individual, or a being; and if we say there are three infinite persons in one Being, each of whom has *all power and all wisdom*, the

proposition contains in itself a contradiction that is obvious to the meanest capacity. Therefore, the advocates of this doctrine are obliged to admit that the term *person* does not exactly convey their meaning, and that they only use it for want of a better. Why then should they contend so strenuously for words that do not convey their meaning?

I shall now proceed to examine the foundation on which this doctrine rests.

In the first place,—It is said that the use of the plural pronouns *us* and *our*, ascribed to the Divine Being, and the circumstance of one of the names given to him in the scriptures being a *plural noun*, indicate that there is more than one person in the Deity. This peculiarity in the Hebrew language*, has furnished one of the

* The late learned and amiable Hindoo reformer, Rammohun Roy, remarks: "Were we even to disregard totally the idiom of the Hebrew, Arabic, and of almost all Asiatic languages, in which the plural number is often used for the singular to express the respect due to the person denoted by the noun: and to understand the term, "our image" and "our likeness," found in the verse, [Gen. i. 26.] as conveying a plural meaning, the quotation would still by no means answer their purpose; for the verse in question would in that case imply a plurality of Gods, without determining whether their number was three or three hundred, and of course without specifying their persons. No middle point in the unlimited series of number being determined, it would be almost necessary, for the purpose of obtaining some fixed number, as implied by those terms, to adopt either two, the lowest degree of plurality in the first personal pronoun both in Hebrew and Arabic, or to take the highest number of Gods with which human imagination has peopled the heavens. In the former case, the verse cited might countenance the doctrine of the duality of the Godhead, entertained by Zirdusht and his followers, representing the God of goodness and the God of evil to have jointly created man, composed of a mixed nature of good and evil propensities: in the latter, it would be consistent with the Hindoo system of religion; but there is nothing in the words, that can be with any justice construed as pointing to a Trinity. These are not the only difficulties attending the interpretation of those terms:—if they should be viewed in any other than a singular sense, they would involve contradiction with the very next verse: "So God created man in his own image;" in which the singular number is distinctly used: as in Deut. ch. iv. ver. 4: "The Lord our God is one Lord;" and also with the spirit of the whole of the Old Testament.

To those who are tolerably versed in Hebrew and Arabic, (which is only a refined Hebrew,) it is a well known fact, that in the Jewish and Mohun mudan scriptures, as well as in common discourse, the *plural form is often used in a singular sense*, when the superiority of the subject of discourse is intended to be kept in view. This is sufficiently apparent from the following quotations, taken both from the Old Testament in Hebrew, and from the Quran. Exo. ch. xxi. ver. 4. "If his masters, (meaning his master) have given him a wife." Verse 6. "Then his masters (that is, his master) shall bring him unto the Judges." Verse 29th, "But if the ox were wont to push with his horn in time past, and it has been testified to his owners," (that is, to his owner.) Isa. ch. vi. ver. 8, "Whom shall I send? and who will go for us?" (that is for me.)

strong arguments of trinitarians; but they appear to forget that the same kind of plural language was applied to the golden calf, which the children of Israel worshipped in the wilderness,—although it is very evident that there was but *one calf* made on that occasion. It is said, that the people brought their golden earrings to Aaron, “and he received them at their hand, and fashioned it with a graving tool, after he had made it a *motten calf*: and they said, *These be thy gods*, O Israel, which brought thee up out of the land of Egypt.” Ex. xxxii. 4. The same plural language is repeated again in verse 8th, “*These be thy gods*, O Israel,” &c. Aaron excused himself to Moses by saying, “They said unto me, make us *gods* which shall go before us,” ver. 23. “And I said unto them, Whosoever hath any gold let them break it off. So they gave it me: then I cast it into the fire, and there came out *this calf*.” ver. 24. Can any rational mind pretend that the use of a plural noun and pronoun in this instance by the Israelites, proves that “*this calf*” was, in some sense, three calves, and at the same time only one calf?

(To be continued.)

SOME EXTRACTS FROM THE WRITINGS OF OUR
DECEASED FRIEND, JACOB L. MOTT.

After the multitude had been fed, the command of the Divine Master was, “Gather up the fragments that remain, that nothing be lost;” and it is now forcibly revived in contemplating the character of our deceased friend, Jacob L. Mott, whom we believe to have been one of those disciples made use of by the Head of the Church, through whom religious assemblies were edified and strengthened in their devotional exercises.

He frequently penned the effusions of his exercised mind, and although these were found in detached sentences, and without date, not intended (apparently) for publication, we yet feel concerned to make some extracts, believing they may be useful to the traveller Zionward.

The following are some reflections on Creation:

Is it possible to survey the several parts of Creation, and not discern, in all, evident traces of the power and goodness of Infinite Wisdom? Who can contemplate the heavens, so beautifully adorned, without discerning the wisdom of Omnipotence? Behold the sun! how wisely is that source of light and heat placed in the centre of the planetary system, that each planet may enjoy a proper share of its warming beams; while none are consumed by too near an approach, or

chilled by too great a distance. Who but the Infinite Being could launch those massive globes through immensity of space, and confine their motion within their respective orbits? “Cans't thou, oh man, bind the sweet influences of Pleiades, or loose the bands of Orion? Dost thou know the balancings of the clouds? Who hath divided a watercourse for the overflowing of waters and a way for the lightning of thunders? Do these happen by chance, or by the secret appointments of Infinite Wisdom?”

Who can contemplate the wonderful properties of air, which constitute that great treasure, the breath of life, without being made sensible that an All-wise and Almighty Being had formed it? We cannot survey the earth without beholding the impress of his power; “He stretcheth out the North over the empty place, and hangeth the earth upon nothing,” filling it with a great variety of useful and admirable creatures, and maintaining them all by the bounty of his hand. It is he that clothes it with beautiful verdure; causes the valleys to stand thick with corn, and crowns the year with his loving kindness. It is he that maketh the herds and the grass to grow upon the mountains for the service of man.

He adorns the lilies of the field with a beauty that excels the splendor of Solomon, and says to the sea, “Hitherto shalt thou come but no further, and here shall thy proud waves be stayed.”

It is he that smooths the tempestuous billows of the deep, delivers the mariner from his troubles, and brings his ship to a port of safety. Therefore how reasonable it is that we worship and adore this kind Creator. Who cannot say with the Psalmist, “Great is the Lord and greatly to be praised in the city of our God, in the mountain of his holiness.” Again, David said, “When I consider thy heavens, the work of thy fingers, the moon and the stars which thou hast ordained; what is man that thou art mindful of him, and the son of man that thou visitest him? For thou hast made him a little lower than the angels, and hast crowned him with glory and honor.”

In the order of creation, the soul of man was made the temple of the living God. He made it a spiritual sanctuary, and dwelling in it, imparted to it the power to govern the immortal part. Thus the government was righteous throughout.

Knowing that man's highest state of enjoyment could only be arrived at through the exercise of his free will, he was created a free agent, but being unwilling to submit to the divine government, chose his own, and thereby fell from a state of happiness; and as he can have no true enjoyment in this fallen state, the dispensations of God have been designed to restore him to that righteous order which was in the beginning, and his first step toward redemption is made by obtaining the mastery over his natural will, by which he is enabled to offer up, not only tempo-

So also in the Qoran, “We are (meaning I am) nearer than the jugular vein.” “Surely we (meaning I) created every thing in proportion.” In these two texts of the Qoran, God is represented to have spoken in the plural number, although Mohummud cannot be supposed to have employed a mode of expression which he could have supposed capable of being considered favourable to the Trinity.”—Appeal. &c. p. 140-143.

ral possessions, but body, soul, and spirit to the service of his Maker.

Never was there a day when the Saviour offered himself to redeem sinners with greater power than at the present. Never were more efficient means offered to prophets under the law, to apostles in the gospel, or to any former generation, than is now vouchsafed to each of the present inhabitants of the earth.

Christ, the Divine Light, that enlighteneth every man that cometh into the world, has been given to all men, in all ages, by which they may be enabled to choose the good and refuse the evil, thereby passing from a state of mere innocence into that of positive virtue; and the soul, being immortal, will be permitted to unite with the heavenly host in the abodes of interminable bliss, and forever sing praises to that great and glorious Being who has formed us for eternal happiness. God created the *bodies* of men as of other animals, from the dust of the earth, their origin and destiny being the same.

The animal body is what the apostle calls the natural man, which he says, "Receives not the things of the Spirit of God." The natural spirit of man which appertains to the body, is not capable of holding divine communion, and can only act in that which comes directly within its limits. "But God breathed into man the breath of life, and he became a living soul;" the soul is spirit, and cannot be generated; it comes immediately from the Almighty; it is the nobler part, and what the apostle calls the inner man, which may be united either to the natural, or to the supernatural and divine spirit.

Thus the soul is a free agent, and has the liberty of choosing. By adhering to that which is natural, the soul receives a birth and life in the animal powers, thus becoming carnally minded, which is death. But if it adheres to the Divine Spirit, it witnesses a birth and life in the true light, and is thus enabled to receive and know the things of the spirit of God, because they are spiritually discerned.

Oh! how God has blessed his creature man in making him thus capable of being united and holding communion with him. It is, therefore, his interest, as well as his duty, to be obedient to his Creator, from whom comes all he possesses or can hope for in the future.

God is a living spirit, eternal, immutable, and omnipresent; from him the light issues, which is the light of the soul. Hence, what is known of Him is manifest in man, for God hath showed it unto him.

Who hath not received the caution that Adam did, "not to desire to know evil?" who hath not heard the language, "In the day that thou eatest thereof thou shalt surely die." Adam had known good—it was not necessary that he should know evil, being only bound to obey the laws of his Maker. But the reasoning serpentine spirit

tempted him, and yielding to the desire to know for himself, he lost his life. Yes, that life which is hid with Christ in God; and had he lived from that day to this, and become learned in all the knowledge of the different ages from that day to the present, he could not, by the exercise of his reasoning powers, come again to the knowledge of his Creator.

How, then, shall I become acquainted with God? How is He to be communed with? These are queries that have no doubt arisen to all. He is in us, He is around about us, He is blessing us by day and by night, His watchful and parental care is extended over us; He is love, He is emphatically altogether love. Oh! then, how am I to know these things? "If any man lack wisdom, let him ask it of God, who giveth liberally and upbraideth none." He is the same He ever was; if we ask of Him we shall receive; therefore we need not search nature, nor call to our aid the astronomer or philosopher—they cannot reveal God; we must not confide in books nor in man. "Lean not to thine own understanding," for the natural man receiveth not the spirit of God; as saith the apostle, "Now we have received not the spirit of the world, but the spirit which is of God, that we may know the things that are given us of God."

Here a query may arise. If God, all wise, perfect and omnipresent, has made man and endowed him with such high powers, from whence cometh affliction? Why is he subject to trials and besetments all his life? and why should he not pass from his creation immediately into the state of happiness designed for him? Those who are tried as to a hair's breadth, and hold fast their confidence in God, and in humble submission receive His will, shall know that it was not consistent with their good that they should pass through time without trials. I will refine thee, but not with silver, "I have chosen thee in the furnace of affliction," said the prophet.

The redeemed know that it is through suffering that they have advanced from an earthly to a heavenly state, therefore they choose to suffer affliction with the people of God rather than enjoy the pleasures of sin for a season, because they have the promise of mingling with angels and archangels through an eternity of bliss.

They have purchased it by the sacrifice of everything that God called for at their hands, and in every act of obedience have been left entirely free. For our own good God has constituted us free and intelligent beings, and endowed us with faculties capable of understanding and practising those duties which He makes the condition of our final acceptance with Him.

He offers but does not impose happiness upon his creatures. Good and evil are set before us; He shows us the spiritual Canaan, and gives us power to enter therein, but no compulsion.

It does not in the least derogate from the good-

ness of our Heavenly Father, that he should leave man to choose whether he will serve his own will, and suffer the fruits of disobedience, or yield himself a servant to the spirit of truth, and reap life eternal. Trials are sent us in infinite wisdom, in divine love; therefore it is our true interest to become reconciled to our Maker.

"Press not thy purpose on thy God,
Urge not thy erring will;
Nor dictate to the Eternal Mind,
Nor doubt thy Maker's skill.

Instead of endeavoring to escape affliction, let us labor to be reconciled—to be resigned to suffer with the people of God, as good soldiers in the christian warfare. Let us be willing to be baptized into suffering again and again; let our prayers arise in the depth of humility, under a renewed sense of the necessity of a greater degree of refinement. "Lord, let not thine hand spare nor thine eye pity. Oh, then, righteous Judge, turn and overturn until judgment is brought unto victory, for thou art just in all thy ways." Oh, let us lay low before the God of our spirits;—and keep humble, and we shall be able to know the voice of the true Shepherd. Who has not partaken of the cup of sorrow, and at times looked with tearful eyes to the Father's throne, and with one formerly exclaim, "Thy waves and thy billows have gone over me; and again, I will say unto my God, why hast thou forsaken me?"

Oh, let us remember this is not the place of our rest; this is not the place of repose, but of labor; this is the hour of trial, not of full reward. Oh, that we may lay hold of the precious consoling promise given to the Church of Philadelphia, "Because thou hast kept the word of my patience, I also will keep thee from the hour of temptation which shall come upon all the world, to try them that dwell upon the face of the earth." Oh, glorious hope, glorious anchor to the christian's soul; hope points beyond the grave, and sweetly says, there is a rest for the people of God.

(To be continued.)

For Friends' Intelligencer.

REMINISCENCES OF E. HICKS.

In a former number of *Friends' Intelligencer* there was a deeply interesting circumstance narrated by the late venerable Isaac Parry, (as found amongst his papers,) regarding a public communication, delivered on a certain occasion by his friend Edward Hicks, with whom he was then travelling as a companion. And thinking that the following extract from the Memoirs of the same minister, (E. H.) as penned by himself, will also prove acceptable, I herewith hand it for publication; it is as follows, viz. A.

"On our way to Yonge Street, (Canada,) we met with a Methodist minister, who knew but little about Friends, but finding we were on a

religious visit, gave us an invitation to have a meeting in a new house, near where he lived, that was used by different societies.

When we arrived at Yonge Street, and were making some arrangements for appointed meetings, this place was fixed upon, to be on First-day afternoon at two o'clock. The roads being bad, we did not arrive at the minister's house, until one o'clock, and found no body at home but children. However, we soon found a good barn and plenty for our horses. The minister and his wife were at meeting, which was within sight, but did not return till near two o'clock. The man who had insisted upon our coming to his house for dinner, seemed pleased to see us, but I thought his beautiful wife looked cross at us. However, she soon got us a dish of tea, and something to eat, while her husband sung and talked. For my part I was so distressed about the meeting, I could neither eat, nor talk, much less sing, and therefore walked off by myself towards the meeting house; it was then after the time appointed. When I got to the house there was no person there. It was cold, and the wind and snow were driving through the weather-boards. I do not know that I ever felt more wretched in a meeting-house; after awhile the people began to assemble in a scattering manner, whispering to each other, while I was the object of all their eyes. My friends, with the Methodist and his wife, also came and we tried to get still as far as example would go, but they were strangers to silence. Notwithstanding there was something like a pulpit, I took my seat on the end of a bench, where I continued to sit, with my mind apparently stripped of everything that was good, with a prospect of being silent, to which I soon became resigned, and was thankful that I could bear my testimony silently to the ever-blessed truth. Under the influence of this precious quiet, I heard the word of command to stand forth in the midst and stretch out my withered arm, and I soon felt the restoring power of the Gospel. The people began to groan and even shout, one man near me I was told, cried out passionately, 'Oh Lord Jesus Christ, seal instruction upon our souls, Hallelulia!' I tried to persuade them for my sake to try to be still, and let their groanings be like those the apostle spoke of, too big to be uttered. I was led to speak of the rights of women, that they were one in Christ with men, and entitled to equal privileges, and that I had heard the Gospel preached by them in greater sweetness and power than I had ever heard from the lips of man. There was a precious silence covered the meeting, which seemed only interrupted by the suppressed weeping of some of the women. After the meeting ended our kind Methodist friend took me by the hand and said, in substance, 'Dear brother, you ought to preach that sermon a dozen times over. Why, we have been contending with our women about

their right to preach.' This man appeared to have the same besetting sin with myself; he was too light and talked too much, but his lovely wife appeared quite changed, and could not talk much. After this triumphant meeting, we rode four miles, to the best tavern on the Dundas street, where we spent the evening most agreeably.

For Friends' Intelligencer.

Brooklyn, 6th mo. 18th, 1859.

Friend W. W. Moore:—The accompanying extracts from a letter received a few weeks since, were so comforting and encouraging to my mind, that I felt as if every lover of the truth would likewise be rejoiced to find, that whatever may be the prejudices of education, the Holy Spirit, when singly sought for, and obeyed, will lead its votaries in the way of righteousness, and I trust that such will also share in the joy which I felt to receive a fresh confirmation of the great truth, that all the children of our Heavenly Father are taught of Him, and great is their peace.

The letter was written by a resident of Coxsackie, Greene Co., New York. L. N.

Dear Sister in Christ:—As you have requested me to give you some account of my religious experience, I will endeavor briefly to communicate some of the circumstances of my eventful life.

Dr. Payson remarked, that he always felt it dangerous to speak of self I can say the same, and yet I have often thought, that to the praise and glory of God's grace, I ought to be willing to tell the great things he has done for me.

My parents were changed from nature to grace when I was 7 years old, so that from my youth up I have been instructed in wisdom's ways.

When about 17 I determined to lead a new life, united myself with the Presbyterian Church, and sought hard to be justified by the deeds of the law. At 19 I was married—my husband was a moral man, but not a Christian—then I began to feel the responsibilities resting upon me, as one professing godliness. I had a deep sense of what a Christian ought to be, but had continually to acknowledge my shortcomings. I urged myself forward in religious duties. Prayed much, fasted, and read the word of God daily, on my knees, asking for Divine illumination. Prayed with, and for my husband; but still had no evidence, none which satisfied me that I was born of God.

At the expiration of 7 years, my husband became a christian. O the change! He was born of the Spirit. This brought over me still greater darkness, in heart I was almost an infidel, at times almost doubted whether there was a God. If there be a God, I urged, why does he not answer my prayer, and communicate himself to me, as he has promised he would to those who

seek with the whole heart. I did not give heed to these temptations, but still they would force themselves upon me. I multiplied my labors to bring souls to Christ, often spending whole nights in prayer with those who were seeking salvation; and while my own heart was sad, and bitterly sorrowful, I would encourage others to trust in the mercy of God; I saw them rejoice, I heard them tell what great things God had done for them, and then turning my eye within, I could find nothing but darkness, and doubts. I felt not the inward witness. Nothing short of this would satisfy me. Still the blessed Spirit was leading me, and had I steadily followed it, I should have much sooner been brought into a broad place.

A few months after my husband's conversion, we changed our place of residence, and in all the ardour of my soul, I was resolved to be a faithful follower of Christ, and own him before the world. Continually it was impressed on my mind, that I had a great work to do, and often would I say, Oh Jesus, grant me the witness of the Spirit, that I may be able positively to testify, "I know the man," then how I will rejoice to go without the camp bearing the reproach, but I dared do no otherwise than go forward and labor the best way I could. Notwithstanding these good resolutions, when the time of trial came, I found myself unprepared to meet it. The second night after our arrival I attended a prayer meeting, the spirit moved me to pray, I knew the minister would not approve, and did not obey the emotion. It was then I quenched the Spirit, but I cannot enter into particulars. Five years passed away, during which time I left the Presbyterians, and joined the Methodists, that I might labor untrammelled; but still, like Job, I went backward and forward, to the right hand, and the left, and could not find Him whom my soul sought. At length I attended a protracted meeting, at which I felt a fervent desire that I might be useful. I cried to the Lord to take me, just as I was, to use me to advance the interest of his cause. I said, if I am lost I will follow thee—'tis my reasonable service. No longer will I ask to be assured that I am thine, from this moment I will take thy word fully and completely, as my counsellor, and thy Spirit for my guide. When the Spirit and the Word agree, it will be safe to follow. I will more fully than ever turn my back upon the world, and ever make it my study to know and do the will of God, and then, for the first time, I came with but this condition—saying, make me a blessing to the world, 'tis all I ask. Determined in all things to conform to the Word and Will of God, every cent of money was henceforth to be laid out, with an eye single to the glory of God—and, lest the wearing of garments I then had might induce others to waste their Lord's money, I resolved to lay aside every

article of dress that was extravagant, and wear only those that were plain and cheap. Freely and unreservedly I laid *all, all* on the altar, without once thinking what I should have in return. I asked for nothing but the Spirit, and promised to follow it—although it led me to the stake. The following night I spent in prayer for Zion's prosperity. I was perfectly empty and quiet. The next morning, faint and feeble, I repaired to the house of worship. I felt like going to sleep, when a secret whisper said, "What, consecrate yourself to God, and on the battle-field go to sleep?" I asked, "Lord, what wilt thou have me to do?" "Pray for the Minister," who was then speaking. In an instant I was on my knees, but scarcely was I there when I felt that Holy Baptism—Christ with his train filled the temple of my soul. I was unutterably full of glory and of God. Yes, it was Christ in me. Oh! the love, the purity. Christ reigned supreme. Reigned alone. I could call Jesus Lord, by the Holy Ghost. During this time I moved not my lips. Stillness, Heaven and glory, filled every avenue of my soul. Instantly the inquiry went, "Now, Lord, what wilt thou have me to do?" "Arise and speak to the people." Immediately I was on my feet. I said to the speaker, "I have a message from God to the people." He told me to speak. I had but little to say; but the words were not my own. Then I could say I know him, for he dwelleth in me. From that day to this, and I am now in my sixtieth year, I can say, with few exceptions, it has been more than my meat and drink to do the will of my Heavenly Father. In the course of time we removed to a Western city, where we boarded with a Quaker lady. An incident occurred, which, being remarkable, I will record. She was one day looking over my things, and discovered a fine lace cap, which I had spent weeks of labor in embroidering. She remarked "it is plain, thee had better do it up and wear it." When I gave up conformity to the world, I begged my Heavenly Father if ever I took back part of the price, that he would set his mark of disapprobation upon it, that I should not sin.

With many misgivings I made it up, and hung it on a peg. I went into an adjoining room—the wind blew it down—a little puppy caught it and tore it in pieces—and I thanked God. A long period elapsed, and we were living in a secluded neighborhood, I thought one day I will do up the mate to that cap, and wear it out. 'Tis partly worn—I cannot sell it, and then husband has thought it more becoming than the plain muslin I wear, and no one will see me in this lonely place to follow my example. Thus I reasoned, and I then put it in readiness, and as I stood before the glass in the afternoon I thought how pleased he would be to see the improvement in my appearance. My glorying, however, was of short duration. That night I

hung it by my bed, the crickets demolished it, having riddled it completely. Well, truly, I thought, if the hairs of my head are numbered, no marvel if God takes cognizance of the most minute doings of my life. Had I time and space I might mention very many direct answers to prayer, and speak of the sustaining grace of God in times of destitution and trouble.

In my travels, many have told me mine was a Quaker's call. I asked for the Spirit's influence, and when it led me I have followed, fearing to take a step without my guide. For years past it has been my practice, as I went to the house of God, to go as a soldier would on the battle field, asking God if he had anything for me to do, with a readiness to obey his holy command, quietly turning within, waiting and watching for the quickening of that spirit that giveth life. Often, just as the services were about closing, I would feel stirred to speak or to pray, and sometimes would sit waiting for an opportunity until my whole body trembled. As soon as I could obey the requisition I felt peace and quietness. Thus, dear sister, in this imperfect sketch you have a slight glimpse of the Spirit's operation on my soul. I am full of what I could say to you, could I be favored with a few hours' conversation with you. I ask your prayers. You have mine, that Christ may dwell in you richly, that your afflictions may be sanctified to you and yours, and that, like gold seven times purified, you may come out of this furnace, and when fully prepared, find the rest of Heaven.

We think an attentive perusal of the article on Amusements, alluded to by H. P., would show that there is no conflict between it and the excellent views of Dymond. Both are condemnatory of immoral and dangerous amusements, and the principal object of the former article, which it is due to the author to say, was *not* from "a Presbyterian paper," although not written by a Friend, was to direct the attention to the provision of such relaxations or amusements in the home circle, as to prevent our children from visiting the theatre, and other places where their morals would be endangered and their innocence destroyed. Ed.

For Friends' Intelligencer.

I noticed in a recent number of the "Intelligencer," an article on the subject of amusements, taken, I think, from a Presbyterian paper, with an editorial commendation. The following extract from Dymond's Essays gives the views of a member of the Society of Friends, on the same subject. H. P.

"It is a remarkable circumstance, that in almost all christian countries, many of the public and popular amusements have been regarded

as objectionable by the more sober and conscientious part of the community. The opinion could scarcely have been general, unless it had been just: yet *why* should a people prefer amusements of which good men feel themselves compelled to disapprove? Is it because no public recreation can be devised of which the evil is not greater than the good? or because the inclinations of most men are such that if it were devised, they would not enjoy it? It may be feared that the desires which are seeking for gratification, are not themselves pure, and pure pleasures are not congenial to impure minds. The real cause of the objectionable nature of many popular diversions is to be sought in the want of virtue in the people. . . . Amusement is confessedly a subordinate concern in life. It is neither the principal nor among the principal objects of proper solicitude. No reasonable man sacrifices the more important thing to the less, and that a man's religious and moral condition is of incomparably greater importance than his diversions, is sufficiently plain. In estimating the propriety, or rather the carefulness, of a given amusement, it may be safely laid down, that none is lawful of which the aggregate consequences are injurious to morals: nor, if its effects upon its immediate agents are, in general, morally bad; nor if it occasions needless pain and misery to men or animals; nor, lastly, if it occupies much time, or is attended with much expense. Respecting all amusements, the question is not whether, in their simple or theoretical character, they are defensible, but whether they are defensible in their actually existing state. . . . If I take my seat in the theatre, I have paid three or five shillings to a number of persons to subject their principles to extreme danger,—and the defence which I make is, that I am amused by it. Now we affirm that this defence is invalid; that it is a defence which reason pronounces to be absurd, and morality to be vicious. Yet I have no other to make: it is the sum total of my justification. Is it lawful to attend? The same question is to be asked, and the same answer will be returned respecting various other assemblies for the purposes of amusement. They do more harm than good. They please, but they injure us; and what makes the case still stronger is, that the pleasure is frequently such as ought not to be enjoyed. A tippler enjoys pleasure in becoming drunk, but he is not to allege the gratification as a set off against the immorality. And so it is with no small portion of the pleasures of an assembly. Dispositions a regratified which it were wiser to thwart; and to speak the truth, if the dispositions of the mind were such as they ought to be, many of these modes of diversion would be neither relished nor resorted to. Some persons try to persuade themselves that *charity* forms a part of their motive in attending such places; as

when the profits of the night are given to a benevolent institution. They hope, I suppose, that though it would not be quite right to go if benevolence were not a gainer, yet that the end warrants the means. But if these persons are charitable, let them give their guinea without deducting half for purposes of questionable propriety. Religious amusements, such as oratorios and the like, form one of those artifices of chicanery by which people cheat or try to cheat themselves. The music, say they, is sacred, is devotional, and we go to hear it as we go to church, it excites and animates our religious sensibilities. This, in spite of the solemnity of the association, is really ludicrous. These scenes subserve religion no more than they subserve chemistry. They do not increase its power any more than the power of the steam engine. As it respects Christianity, it is all imposition and fiction; and it is unfortunate that some of the most solemn topics of our religion are brought into such unworthy and debasing alliances."

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SEVENTH MONTH 9, 1859.

We give in another column the Prospectus and table of Contents of a work entitled "Retrospect of Early Quakerism," &c., by Ezra Michener, which is now ready for publication, and which we believe will be an interesting volume, having been collected with much labor from the early records of Society.

☞ "Farewell to Music" has appeared in a previous number.

☞ We rarely publish poetical Obituaries, and must decline "Lines composed by a husband on the death of his wife."

MARRIED, According to the order of Friends, on Fifth-day, the 26th of Fifth month, 1859, JOHN CHILD, of Philadelphia, to MARY H. SCHOFIELD, of Darby, Pa.

DIED, At Oakland, Allegheny Co., Md., on Third-day, 14th of 5th mo., WM. P., endeared son of Daniel E. and Lucy H. Gerow, aged 34 years, after a protracted illness of a pulmonary character, quietly departed this life in entire resignation to the Divine will and the full assurance of a well grounded hope. He was a member of New York Monthly Meeting, late resident of Darien, Fairfield Co., Connecticut. His remains were interred on the 19th, near the residence of his parents in Fairfield Co., Conn., and his funeral, which was solemn and impressive, was attended by a large concourse of near relatives and friends.

—, On Fifth-day, the 23d ult., at Deer Creek, JOSEPH HUSBAND, of Baltimore, in the 63d year of his age.

DIED, Suddenly, at Yardleyville, Bucks Co., Pa., on the morning of the 27th of Sixth mo., SARAH S., wife of Wm. Yardley, in her 56th year.

LIBRARY NOTICE.

A stated meeting of the Committee of Management of the Library Association of Friends of Philadelphia, will be held in the Library Room on FOURTH day evening next the 13th inst. at Eight o'clock.

Tib mo., 1859.

JACOB M. ELLIS, Clerk.

RETROSPECT OF EARLY QUAKERISM:

Being Extracts from the Records of Philadelphia Yearly Meeting of Friends, and the meetings constituting it; with an account of their first establishment. By EZRA MICHENER.

PROSPECTUS.

It has been the design of the Author of the proposed volume to rescue from oblivion the early advices and disciplinary regulations of Philadelphia Yearly Meeting and the Meetings composing it, and to exhibit their practical operation upon its members, by copious selections from authentic records which are not generally accessible to Friends. There will also be prefixed an account of the first establishment of all the Meetings for worship and discipline, as far as can be ascertained, including twelve Lithographs showing the position of the Quarterly Meetings, and also the Meetings respectively composing them.

It will be printed on similar paper, type, and page of this Prospectus, and contain about 360 pages.

To Subscribers the price will be \$1 25 in cloth, and \$1 50 in sheep (library style)—payable on delivery.

Agents will be allowed one copy in cloth for every six Subscribers obtained. The work will be published as early as the subscriptions will warrant.

There was a time when continental visitors called England 'the hell of horses, the purgatory of servants, and the paradise of women,' from the two former having everything to do, and the latter nothing. The lapse of centuries has materially altered this aspect of affairs. The railways have annihilated the hardest-worked class of horses; improvements in the arts of life have relieved our servants of a great amount of toil, while on the whole elevating their condition; the women of the United Kingdom have been led forth from their paradise into a life of labor and care, more strongly resembling that of men than either the men or women of old times could have anticipated. Wearied as some of us are with the incessant repetition of the dreary story of spirit-broken governesses and starving needle-women, we rarely obtain a glimpse of the full breadth of the area of female labor in Great Britain; and it requires the publication of the 'Results of the Census,' or some such exhibition of hard facts, to make us understand and feel that the conditions of female life have sustained as much alteration as the fortunes of other classes by the progress of civilization. Sooner or later it must become known, in a more practical way than by the figures of the census returns, that a very large proportion of the women of England earn their own bread; and there is no saying how much good may be done, and how much misery may be saved, by a timely recognition of this simple truth.

The idea itself expressed by the form of words 'earning one's bread,' is somewhat modern,—except indeed in the primitive sense in which Adam was set to do it. In the modern sense of 'earning one's bread,' the position arose for men first, and subsequently for women, after the creation of a middle class of society. The thing and the name have been recognized for some centuries in regard to men. Women have

been more and more extensively involved in the thing, especially during the last half-century; but the name is new and strange; and the extent to which they work for a maintenance is a truth known scarcely to one in ten thousand of us. It is as well to know it; and timely attention to the fact is the best way to know it to practical purpose.

There is no reason to suppose that women's lives were less laborious than now, in the early days when they had no responsibility about their own maintenance. When there was no middle-class, and no shopping and marketing, the mere business of living was very hard work, both to men and women. They belonged to somebody, except the few who owned the rest; and the owners had perhaps as much on their hands as the dependents. The gentlewoman of ancient times had to overlook the preparation of every article of food, clothing and convenience, for a whole settlement, in days when the corn had to be grown, reaped, and dressed at home; and the wool and hemp the same; and all the materials of building, furnishing, and adorning. The low-born women had to grind the corn before they could make the bread; to spin the wool and dye and weave it before they could make the clothes. Every process was gone through on every estate. Every step of daily life was laborious; and all working men and women were slaves. Not a few of them were called so in the days when the Irish used to purchase their work-people from England. 'The spindle side' of the house, as King Alfred called the gentlewomen, ascertained how many hands were necessary to do the women's work of the establishment; and the useless were got rid of, by one method or another, and chiefly by sale to Ireland, or the estate suffered. In those times, there was no such idea afloat as that of self-dependence for subsistence. The maintenance was a matter of course; and hard work a common necessity, everywhere outside of the convent.

The lot of the laborer seems to have been little lightened when the middle class began to grow, though more and more articles were to be had by purchase, and much toil and time were saved by new arts of life. It was a great matter when the mill saved the pounding of corn. It was a great matter when the first Flemish weavers came over with their looms, and spared the women a world of trouble about 'homespun.' Before that, the foreigners used to say that the English were scarcely anything but shepherd and wool producers. More wool than ever was wanted; but the savings of the women's time and labor led to an increased production of poultry and eggs, butter and cheese, and many other good things. Still, the work must have been as hard as any that is known now. The days of the small yeomen had come on; the trading-class was beginning to appear; and all domestic mat-

ters rested on the women as entirely in the farmhouse or cottage as in the castle or mansion. 'To winnow all manner of corn, to make malt, to wash, and to make hay, shear corn, and in time of need, help her husband to fill the muck-wain or dung-cart, drive the plough, to load hay, corn, and such other, to go to market and sell butter or pigs, fowls or corn,'—such was the duty of the farmer's wife, according to Fitzherbert, in the first English work on husbandry. The women had to make the straw or flock beds, and the chaff pillows, when that luxury replaced the log of wood. They had to spin, weave, and dye the coverlets, and all the fabrics worn by the household, not being wealthy enough to employ the Flemings as the higher orders did. All the measuring and administration of the corn and pulse was the women's business, and the preparation of the winter food, that is, the salting and drying of the lean cows which were killed in autumn, because no way was known of keeping cattle alive till the spring grasses were ready. The women made the candles and the salt, and the soap; and the mead from the beehives, and the cider from the orchard; and they spent no little time in collecting the finest inner bark in the forest, and the best herbs in the fields, to make bread of when corn and pulse failed. In all the intervals, the spinning was going on;—that art which has given a denomination to the unmarried women of Great Britain and the United States to this day. First, in keeping the cattle, sheep, and swine, the women plied the distaff, as we now see the Alpine girls plying it amidst their goats, and the Arab maidens near almost every well or moist *wady* in the desert; and then, when the spinning-wheel came in, its whirr was heard all over the land, all day and the last thing at night. 'It stops a gap, and so must needs be,' was the reason assigned by the men; and in every house or hovel, there stood the wheel for every woman to sit down to, in the intervals of other business.

The gentlewomen first exhibited the change wrought by the rise of a shop-keeping class. It gave them more time than Englishwomen ever had before. There were seasons when, in the absence of husband or father, they had to govern large households or small districts,—with millions of details to attend to; but even then, from the time when the miller ground the corn, and the vintner supplied the wine, and stuffs were to be had from the merchant, the mistress of an establishment had something of the leisure of a princess for doing what she had a fancy for;—and that was, for the most part, working tapestry. While the priest wrote the letters, and the steward kept the accounts and made the purchases, the lady could overlook the garden from her lattice, and the kitchen from the gallery, without much interruption to the grave labor of stitching the seige of Troy, or the find-

ing of Moses, in colored wools or silks. These colored silks bring us to a point of view whence we can get a glimpse of a change in the life of those times. When shops were so established an institution as that laws were made from year to year to regulate measures and weights, and exportation and importation, a rabid hatred sprang up against the Lombards who brought in silk ready for use, (deceitfully wrought) so as to destroy the mystery of the silkwomen and spinners, 'and all such virtuous occupations of women.' This was in 1455. Half a century later, the new prohibitions of small articles of wrought silk from abroad went by the name of enactments 'for silkwomen; and it seems as if there were really women who made 'knit articles,' girdles, cauls, nets, laces, &c., for profit, as well as for household use. While reading the pulpit censures aimed at the ladies' dress, in those days when silk was a bewitching novelty, the 'headdresses, horns, tails, and ornaments of pomp,' we can easily imagine that there was a demand 'for silkwomen' beyond what separate households could supply; and hence the rise of one of the earliest branches of female industry.

We can, at this moment, recall very few others capable of yielding a subsistence. In all ages and all nations there has been a tendency to commit medical and surgical practice to old women. It is so now, in the heart of Africa, and in the backwoods of America, and in the South-sea islands, and in remote parts of some islands which lie in a northern sea. One of the earliest figures in the lengthening series of female bread-winners is that of the doctress, with her simples and her ointments, and her secrets, and her skill in dressing wounds. By a similar mysterious adaptation, the doctress has been, in all times, the fortune-teller, or the witch, or at least the match-maker,—vocations by any of which a good deal of money has been obtainable from age to age. In some analogy with these is, or was, the vocation of cook,—a profitable one also. Sending her messes from her own fire, or carrying her own saucepans and spices and herbs to the rich neighbor's kitchen, or the lady's still-room, the skilful cook was more patron than client, in times when English banquets were emerging from utter barbarism. There seems to have been little besides in the way of paid industry. The occasional foster mother took the infant home to be reared. The sick nurse was either one of the household, or the doctress. Orphans, or the daughters of impoverished gentlemen, entered the household of some great lady, as maids of honor did those of queens; but, beyond this, it does not appear that women sustained themselves by any other industry than the kinds we have indicated.

In those days, therefore, the supposition was true which has now become false, and ought to be practically admitted to be false;—that every

woman is supported (as the law supposes her to be represented) by her father, her brother, or her husband. In those days unmarried women were rare; and convents were the refuge of celibacy. It was not only in royal families that children were betrothed in their cradles. In all ranks, parents made matches for their children at any age that suited the family convenience; and the hubbub that ensued, when a daughter refused to marry at her parents' bidding, shows what a disaster it was considered to have a woman in the house who would neither marry nor become a nun. There was, in such a state of society, no call for female industry, except within the establishment,—whether it were the mansion, the farm, the merchant's dwelling, or the cottage. From that time (the uprising of a middle class) to this, the need and the supply of female industry have gone on increasing, and latterly at an unparalleled rate, while our ideas, our language, and our arrangements have not altered in any corresponding degree. We go on talking as if it were still true that every woman is or ought to be, supported by father, brother, or husband: we are only beginning to think of the claim of all workers,—that their work should be paid for by its quality, and its place in the market, irrespective of the status of the worker:—we are only beginning to see that the time must come when such artificial depreciation must cease, under the great natural laws of society. We are (probably to a man) unaware of the amount of the business of life in England done by women; and if we do not attend to the fact in time, the knowledge will be forced upon us in some disadvantageous or disagreeable way. A social organization framed for a community of which half stayed at home, while the other half went out to work, cannot answer the purposes of a society, of which a quarter remains at home while three-quarters go out to work. This seems to be clear enough. It does not follow that extensive changes in the law are needed; or, that anybody is called upon to revolutionise his thoughts or his proceedings. The natural laws of society will do whatever has to be done, when once recognised and allowed to act. They will settle all considerable social points,—all the controversies of the labor-market, and the strifes about consideration and honor. All that we contend for at this moment is, that the case should be examined and admitted. Under a system like ours, in which the middle-class of society constitutes the main strength of the whole organization, women have become industrial in the sense of being the supporters of themselves and of a large proportion of households: and their industrial production is rapidly on the increase. The census of 1851 affords some idea of how the matter stands. 'While the female population has increased (between 1841 and 1851) in the ratio of 7 to 8, the number of wo-

men returned as engaged in independent industry has increased in the far greater ratio of 3 to 4. (*Industrial and Social Position of Women*, p. 219.) We are not very far from another census, which will afford the means of learning what that progress will have been in ten years. Meantime, we can hardly do better than prepare ourselves to estimate the next disclosure, by looking at the case as it stands to-day.

(To be continued.)

For Friends' Intelligencer.

Review of the Weather, &c., for SIXTH Month.

	1858.	1859.
Rain, during some portion of the 24 hours,	15 days.	15 days.
Rain, all or nearly all day,	1 "	1 "
Cloudy without storms,	2 "	5 "
Ordinary clear,	12 "	9 "
	30	30

TEMPERATURES, &c.

Mean temperature of the month per Pennsylvania Hospital,	75.18 deg.	69. deg
Highest do. during month do.	94. "	94. "
Lowest do. do. do. do.	54. "	42. "
Rain during the month,	4.95 in.	6 in.
Deaths counting four current weeks for each year	760	709

The average of the mean temperatures of this month for the past *seventy* years has been 71.52 deg., while the *highest* during that period occurred in 1828, 1831 77 deg.; and the *lowest* in 1816, 64 deg.

During the forepart of the month several heavy frosts occurred, extending over almost the entire extent of the Union, doing in many neighborhoods great damage to the crops and early fruit. The 5th and 11th instants will long be remembered by the sufferers, particularly the former, on which morning *ice* was seen in many places.

The abundance of rain still continues, the comparative account for the six months just closed for the past three years, being—

1857.	1858.	1859.
25.97 inches.	20.56 inches.	31.17 inches.

And although cloudy and rainy weather has *appeared* to predominate to an unusual extent this year, a glance at our record shows that we are apt to forget from year to year what has preceded the present.

The number of days recorded as "*clear*" during the first six months of the three years before alluded to is as follows:—

1857.	1858.	1859.
61.	62.	61.

In confirmation of our forgetfulness we quote the following from our review of the corresponding month last year:

"The rainy and cloudy spell of weather spoken of in last month's review continued with but *three* clear days in *this* month, up to the 18th instant *inclusive*, that is to say, from the *fifth* day of Fourth month, up to said 18th inst., there

had been but *ten* clear days, and it was only by straining the point in several instances, that even this small number could be recorded."

To make another summing up—out of the *seventy-five* days thus designated, we had *fifty-five* on which rain fell; *one* snow; *nine* cloudy; and *ten* clear, or nearly so.

Can that renowned personage, "*the oldest inhabitant*" show a record to beat this?"

Philada., Seventh month, 1859.

J. M. E.

THE WITHERED DAISIES.

BY THE AUTHOR OF "OVER THE RIVER."

"Because *she* loved them."

You ask me why I love them so,
Those little simple flowers,
That over every pasture blow,
In April's sunny showers;
And why a daisy wreath I twine,
Instead of dewy roses,
To hang about the holy shrine
Where our lost child reposes.

'Twas in the Spring-time that she came,
And all the forest mazes
Were bright with flowers without a name,
The fields were white with daisies.
You know how beautiful she grew,
How fair and sweet and holy,
But the violet, wet with morning dew,
Is not more pure and lowly.

She flitted like a sunbeam bright
Around our cottage door;
Her footsteps, as a fairy light,
Made music on the floor,
On every flower of wood or glade,
She lavished childish praises;
She loved all things the Lord has made,
But most she loved the daisies.

How many thoughts beyond her years,
That then were all unheeded,
We think of now with blinding tears—
Sweet teachings that we needed.
Three happy years we led her feet
Along life's stormy mazes;
The fourth, we laid her down to sleep
Beneath the April daisies.

'Tis well, and we are reconciled,
For He who gave the blossom,
Who lent to us our angel child,
Recalled her to His bosom.
And waiting till he calls for me,
To sing with her His praises,
I'll keep her blessed memory
Embalmed in April daisies.

THE GIRDERS AND THE DOME.

BY EDWARD C. JONES, A. M.

A gazing throng assemble,
Where stand the massive walls,
And some perhaps may tremble,
For fear the workman falls.
The girders he is raising
As though he felt at home,
The girders he is praising,
On which to rest the dome.

In time that man who toileth,
 With moisture on his cheek,
 Will yield to him who spoileth,
 And loves the strong to seek,
 But traced against the heaven,
 As child who leans on home,
 Reposing on the girders,
 Will be the airy dome.

And there are moral girders,
 Of honesty and truth,
 Reared when upon the borders,
 Of frank and candid youth.
 The principles of honor,
 Like seasoned wood and strong,
 Can bear a steady pressure,
 Nor say the time is long.

When character completed,
 Commands the gaze of earth,
 'Tis like a dome thus seated,
 On girders full of worth.
 Conspicuous from a distance,
 In majesty and grace,
 Type of a pure existence,
 We love its lines to trace.

Oh! mothers! though no plaudit,
 Attends your fireside task,
 Yet duty's path is crowded
 With all the bliss you ask.
 And you who train our childhood,
 Within the nook of home,
 Sublimely raise the girders,
 On which must rest the dome.

For Friends' Intelligencer.

NATURAL HISTORY OF BIRDS.

BY YARDLEY TAYLOR.

(Continued from page 250.)

Of birds of passage, the wild goose, and swan, are well known examples. They pass here regularly in the fall and spring, going north in summer to rear their young. The marshes around Hudson's Bay, within the polar circle, are believed to be their summer haunts, where they are unmolested by man. Indeed, it is said to be dangerous to approach the nests, particularly of the swan. The stroke of their wings is said to be very severe, and their bite dangerous. In passing here they have been sometimes shot at and crippled, but all attempts to take them alive have failed, as they had to be killed before capture. They always fly in a straight line, diverging about 45 degrees from a direct course, except in foggy weather, when they lose their direction and become confused. The motion given to the air by the stroke of the forward bird is believed to make it easier to the next one to follow in that direction. The leader in this case must have a more laborious time than the rest, and they have been observed to change places with each other as if for relief. The swan is considered a noble bird, perfectly white, and when standing upright, five feet in height. Its long arched neck, while swimming, gives it a graceful appearance. They are looked upon as great ornaments to ponds of water. In Australia, it is said, there is a black swan.

The wild turkey, perhaps the heaviest bodied bird in North America, was once common here, as well as every where else in the United States, but is now rare; the cutting away of the forests having deprived them of a resort sufficient for their protection. They are now only found on our mountains and wooded hills. Their color is invariably dark-brown approaching to black, but the domestic turkey, originating from the wild one, is now found of various colors, from black to white. The flesh of these birds, both wild and tame, is justly considered among the very best of the poultry kind, the former particularly, perhaps more from its scarcity than from any real merit. They make their nests in a secluded quiet place, and the female takes the precaution to cover up her eggs with leaves, grass, &c., on leaving the nest. This is the more necessary as the eggs are large and white, with small brown specks, and would otherwise be easily seen. The young are quite tender at first, though they begin to travel soon after being hatched, and are led about very quietly while small, and hovered over by the hen with care. They keep very much together in flocks, and in the fall and winter the males keep to themselves and the females to themselves, but on the approach of spring, as pairing time comes on, they separate into couples during summer. They feed in the fall much on nuts and acorns, and during summer on insects and seeds of various kinds. The tobacco growers are well pleased to have a large flock of tame turkeys to traverse their tobacco fields, as they are famous for picking off the worms from the leaves of the plant. They feed on grasshoppers in our pasture fields.

We have here another bird, now becoming rare, and only found in places similar to those frequented by the wild turkey. It is here called the pheasant, but is the ruffed grouse of ornithologists. Their color and habits are similar to those of the partridge, except that they frequent thick bushy woods instead of fields. When an enemy approaches they remain perfectly still, and being of the color of dead leaves are not easily seen, but if he comes too near they suddenly rise and fly with great rapidity, causing a whirring sound by the quick motion of their wings. They seek a place for their nest like the turkey, and their eggs are in size about midway between the partridge and common hen, and are white. They have a curious way of striking their wings quickly against their sides, producing a drumming sound that may be heard a considerable distance. They have particular places where they do this, generally a log or similar place; and hunters take advantage of this fact to shoot them. They find out their haunts and when they hear the sound, approach the place under cover of a screen, and thus get near enough to kill them. In woods where they are numerous this drumming sound may be heard

in different directions at the same time, as if answering one another. Their flesh is considered excellent for the table.

The crane is a bird sometimes seen here during summer, though it can hardly be said to belong to this section. Some of them are white and some of a bluish color. They have long legs and a long neck, and when standing upright often reach to four or five feet in height. As they obtain their food from the water, they are well calculated to wade and fish in shallow streams, and are only seen here in dry seasons, when our streams are low. I have not known of their breeding here.

In studying the natural history of birds, we find much to admire, to interest, and instruct the lover of nature. We see their conformation adapted to the life they lead, and the kind of food they subsist on. Their anatomical structure is wonderfully adapted to their condition, and enables them to traverse the air in a different manner from other organized beings. Those that live on insects and worms have moderately long bills suitable for their capture, while the fly-catcher tribe, or those that take their prey on the wing, have short bills but wide mouths, and mostly long and strong wings to sustain flight. The woodpecker tribe have rather long and very strong bills and a muscular neck, to enable them to bore holes in trees to build their nests in, and to seek their food in timber. The waders, or those who seek their food in water or marshes, have long legs and necks as well as long bills, well calculated for their manner of living. Those that feed on flesh, have very strong and sharp claws to secure their prey, and hooked bills to tear it in pieces. The swimmers, or those of the geese and duck tribes, have feathers that are very close and compact, lined with down underneath, and oiled with an unctuous substance, secreted by the bird, thus rendering them impervious to the water, and keeping the body warm in the coldest weather.

The structure of their bones is remarkable. All the larger bones, where strength is required, are hollow and filled with air, thus giving the greatest possible strength with the least amount of material and the lightest form possible.

The structure of a feather is interesting, and gives evidence of wisdom and design. Take a goose quill for example; the barrel of it is a cylinder more or less long, of a horny substance nearly transparent, and may be made so by clarifying, and of which writing pens have long been made. This form and material gives great strength with little weight. This cylinder is succeeded by the stem of the feather of nearly a square form, the outer part still of a horny texture filled with a light spongy matter. From two sides of this stem issues thin, flat, elastic plates, tapering towards the extremities, and placed at an angle with the stem, more or less

acute. The flat sides of these plates are lined with minute fibers, causing them to adhere to each other, and thus to be kept in place and presenting an even surface. In the quills or wing feathers, these rows of plates are thinner and much stiffer, and narrower on the upper side of the wing than on the under side, and these always overlap the broader edge of the feathers beneath it, thus supporting it.

The form of the wing is concave beneath, preventing resistance to the air by the downward motion, and when the bird strikes backward the velocity is increased; and when about to alight it spreads its tail and wings so as to present the greatest surface to the air, and thus checks its motion. The quills or wing feathers of those birds that make a rapid motion with their wings when flying, are much stouter and stronger, than those of birds of slower motion. Those of the wild turkey are much more so than those of the buzzard, though those of the latter are the larger of the two.

The different colors and shades of colors on the feathers of birds are curious; sometimes a feather will be all one color, and then again of several colors, sometimes colors in bright contrast are side by side, as if applied by the painter's brush across the feathers, and then again spots larger or smaller giving the surface a spotted or speckled appearance. The feathers of some birds when viewed in particular shades of light, present a changeable appearance equal to the finest silk.

The writer has devoted some of his leisure hours to the natural history of birds, and could he interest the minds of the young, in noting and observing the operations of nature around them, he would be amply repaid. We should pass through the world with our eyes open and note things as they occur, and though many of these may seem at the time of little value, yet we shall meet with few that may not in after time be of use to us. Single occurrences treasured by the observing mind as disconnected links, when brought together, have proved as a chain that beautifully unfolds the operations of nature, and gives us an insight into the wisdom of its great Architect. We are placed here in a condition of advancement, and our aim should be progress, and as we exert ourselves we shall find that our means for advancement are in proportion to our industry. But it is all important that our industry should have a right direction, and to be able to give it a right direction we should consult the experience of the wise and good, but above all we should attend to the monitions of truth in our own minds. In natural things men have not become eminent by reading the experience of others alone, but in proving by their own labors the correctness of that experience. 'They that seek shall find,' is a truth in natural as well as in spiritual things.

TRAVELLING IN A CIRCLE—HABITS OF BEWILDERED PEOPLE.

A correspondent of the *Scientific American* says :

"In a late number of your paper you state, in answer to some correspondent, that you have no confidence in the report that 'when a man is lost he will travel in a circle.' In this you are certainly mistaken; it is a fact well known to all frontiers-men that, when persons are bewildered, they frequently travel in a perfect circle, sometimes keeping the same track until they make a dozen equal rounds; at other times making the circle larger or smaller each time. It is not by any means always the case when a person is lost; but it is so frequent that it is within the experience of every one who has been much in the woods. In calm and cloudy weather, and in a country of much sameness of appearance, the best woodsmen get so bewildered as to 'take the circles.' Persons not accustomed to the woods will sometimes do so when the sun is shining and a steady breeze blowing. On the level of gulf prairies of this country, on a calm, foggy morning, no man can travel without a road. It is an incident of every day occurrence in the spring and fall seasons that men are thus becalmed on the prairies as effectually as are ships at sea; nor will a compass mend the matter, for it cannot be carried steadily enough to keep its meridian, and the course it points cannot be kept for fifty yards; if a man attempts it he will make a circle and come back to the place where he started from. The circle will be large or small generally in proportion to the density of the fog—sometimes only a hundred yards in diameter; at other times a mile, but seldom more. The circles thus made are perfect. This kind of wandering seems to arise from an attempt to go a straight course when there is nothing to guide the senses, or when the usual guides of sun, wind, or general contour of the country are disregarded. It rarely befalls children, who do not attempt to go a *course*, but only run from one visible point to another equally perceptible."

Correspondence of the N. Y. Tribune.

A WATER-SPOUT ON THE PRAIRIE.

TERRIBLE DESTRUCTION OF LIFE AND PROPERTY.

Iowa City, Iowa, May 25th, 1850.

Hastily, and by the first mail, I inform you of one of the most fearful calamities that has ever happened hereabouts. Last evening while it was yet light, there arose suddenly a violent wind accompanied by strong indications of rain. In a few moments, the whole horizon became pitchy black, and the most vivid lightning darted athwart the sky. A terrible thunder-storm burst upon us. While yet it was raging fearfully, the sky suddenly appeared unclouded in the east for several degrees in width. Many of our citizens,

who were watching from their windows the raging of the storm, discovered, indistinctly at first, the rapid approach of an immense water spout. The phenomenon was so unusual that the attention of hundreds was drawn to it. The appearance of the huge volume of water as it reached from earth to sky—swaying to and fro like a rope hung in the wind—was exceedingly grand. The water spout remained in sight nearly fifteen minutes, when the sky becoming obscured it was lost sight of. The storm soon passed over, and all waited anxiously for news from the prairie, distant about six miles from the city, over which the water spout passed. Scarcely an hour had elapsed before news was brought that Jesse Berry, a member of our Common Council, had been killed in a barn which had been thrown down by the violence of the wind and water. The next express from the country brought us information that a family by the name of Morgan, three in number, had been struck, two of its members killed instantly, and the mother so seriously injured that it is thought impossible for her to recover. John Frick, who was in a brick house, which was entirely demolished, by some providential circumstance, escaped with but slight injury. Two men, whose names I could not learn, were killed instantly. Many have had their legs or arms broken, and others have suffered from contusions and fractures, occasioned by the fall of houses, which had been blown down upon them. But it is impossible for me to give you the correct details in the midst of the confusion and rumors incident to so distressing an event. I have only given such facts as I know to be correct. If I were to take the many stories that are being told by those who are arriving every hour from the scene, the account of killed and wounded would be swelled to ten times the number I have mentioned.

The water spout seems to have been from thirty to forty feet in diameter, and to have destroyed a large amount of property. Its extent was from seven to ten miles, and it is said to have travelled with great rapidity. In one instance, a barn of Mr. Berry's, lately built at a cost of \$1,200, was taken from its foundation, carried some three hundred yards, thrown down and crushed into a thousand fragments. A child of Mr. Walsh was taken up and carried nearly 500 yards, thrown into a slough, but, strange to say, escaped with its life. The spout appeared like an immense funnel, and it seemed very near, for the whirl and sparkle of the water could be plainly seen. But the mail is already being made up, and you will probably learn from other sources more concerning this great phenomenon.

P. S. As I am closing this letter I learn that eight are thus far known to have been killed; but I have been unable to ascertain any more names.

ITEMS OF NEWS.

ENGLAND.—A recent steamer brings the intelligence that the Derby ministry have resigned. Lord Palmerston has been appointed Premier, and Lord John Russell Secretary of Foreign Affairs.

ME TERNICH.—At the advanced age of eighty-six, the oldest statesmen of Europe has died—the last of the able politicians who took part in the establishment of the Treaties of 1815, who not only framed but signed them, who vainly hoped that thereby had been secured the so-much-desiderated “balance of power in Europe.” Prince METTERNICH, who was actual ruler of Austria, from 1809, when he succeeded Count STADION, as Minister for Foreign Affairs, until 1848, when the third French Revolution drove him from office, was born at Coblenz, in 1773, and died on the 11th ult.—*The Press.*

The work on the Great Eastern steamer is rapidly progressing, and there is no doubt that she will be finished and at sea before the end of the 9th mo.

RAIL ROAD ACCIDENT.—A dreadful accident occurred to a train on the Michigan Southern Railroad, on the 27th ult., near South Bend, caused by the washing away of a culvert.

There were about 150 persons on the train, 33 of whom were taken from the ruins dead, and fifty or sixty others wounded. The rest have not yet been heard from.

The stream where the accident occurred, which is naturally but a rivulet, was swollen by the extraordinary rains of the previous afternoon and evening, and the drift-wood brought down by the flood choked the culvert, and converted the embankment into a dam. The great weight of the water, with the concussion caused by the crossing of the train, was the occasion of the sad calamity.

The train was running at the time at the rate of ten to twenty miles an hour.

The train coming west had passed over the embankment safely, only three hours before the accident.

RUSSIA.—The Emperor of Russia, with the view of encouraging colonization on the Amoor, has decided that exiles in Eastern Siberia, who may be disposed to seek for work on the Amoor, may obtain leave of absence for three years, provided they have conducted themselves well, and provided also the rent and taxes they owe as colonists be paid in advance for all the time of their absence, either by themselves or the persons employing them. The Emperor has further ordered that if an exile shall desire to establish himself permanently on the Amoor, he may be authorized to do so.

SLAVE TRADE MEETING IN SAVANNAH.—A very large meeting of the citizens of Savannah and vicinity was lately held in that city, to listen to an address on the policy of re-opening the African slave trade. “At the close of the address,” says the *News*, “resolutions in favor of the repeal of all laws, State and Federal, against the importation of African slaves, and recommending the opening of the trade, were offered and adopted without a dissenting voice.”

EMIGRATION.—The New Orleans *Delta* says, “Large parties of free persons of color have lately, at intervals, emigrated to Port au Prince, in Hayti, for the purpose of there settling. They carry out with them farming implements, goods, a goodly quantity of money, and all the necessary articles to constitute a settlement.”

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Market is dull. Receipts of Flour continue light, and prices are again lower. Sales of good superfine are reported at \$6 25 for common extra. Good Western extra at \$6 50. The sales

to the home trade are limited between \$6 25 and \$7 75 for fancy lots. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 25 and the latter at \$3 75 per barrel.

GRAIN.—Wheat is lower and without demand. Sales of Pennsylvania and Western red at \$1 50 a 1 60, and white at \$1 60 a 1 70. Rye is selling at 85 c. Corn is in rather better demand. Sales of yellow at 85 cts., afloat. Oats are dull and plenty. Sales of prime Delaware at 40 cents, and Pennsylvania at 42 cents. In Buckwheat there has been a further sale at 85 cts.

CLOVERSEED comes forward slowly, and prime lots command \$5 50 per 64 lbs. Timothy has declined to \$2. Flaxseed is scarce at \$1 65 a 1 68.

A well qualified teacher is wanted to take charge of Darby Monthly Meeting School. Application can be made for further information to

RACHEL T. JACKSON or
M. FISHER LONGSTRETH
Darby P. O. Penn.

6th mo. 1st, 1859.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

SUMMER BOARDING in a healthy location, among mountain scenery, can be obtained in Unionville, Centre Co., Pa. Objections on account of the distance and attendant expense in travel will be obviated by a reduction in usual rates of board. For particulars address

WM. HICKLEN,
Fleming P. O., Centre Co., Pa.

HENRY LONGSTRETH respectfully informs his friends that he has removed to 1336 Chestnut st., opposite the Mint, where he proposes to keep always on hand a large collection of Friends' Books, together with School and Miscellaneous Books.

He is prepared to furnish Libraries with whatever books may be wanted at very low prices.

HENRY LONGSTRETH,
Cheap School Book Depository, 1336 Chestnut st.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The summer session of this Institution will commence on the 16th of 5th month, 1859, and continue twenty weeks,

Terms, \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address
HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
4th mo. 9—3m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SEVENTH MONTH 16, 1859.

No. 18.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South-Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

On the Divine Being.

(Continued from page 259.)

The belief in one self-existent, eternal, omnipotent, and omnipresent God, was the great and fundamental doctrine of the Jewish religion; and the writings of the Old Testament are full of passages declaring that there is but one God, who is himself the Saviour and Redeemer of men. "I am the Lord," says he, "and there is none else—there is no God besides me."—"Thus saith the Lord, the Holy One of Israel, and his Maker." Is. xlv. 5, 11. "I, even I, am the Lord, and besides me there is no Saviour." "Thus saith the Lord, your Redeemer, the Holy One of Israel." Is. xliii. 11, 14. These sentiments are reiterated and confirmed in the New Testament. "Jesus answered, The first of all the commandments is, Hear, O Israel, the Lord our God is one Lord." "And the scribes said unto him, Well master, thou hast said truth, for there is one God, and there is none other but he:" Mark xii. 29, 32; which proves that the Jews believed then, *as they do now*, that he is one undivided Deity.

We are told by the highest authority, that "none is good save one; that is God." Luke xviii. 19. The apostle Paul says, "God is one." Gal. iii. 20. And the apostle Jude says, "To the only wise God our Saviour, be glory and majesty, dominion and power, both now and ever." ver. 25.

2. There are many names given to the Divine Being, in the Old and New Testaments, which are either expressive of his attributes, or descriptive of the various ways in which he has manifest-

ed himself to the children of men, according to their several states and capacities. Thus he is called Jehovah, or self-existing; and he is called Jah, which means eternal. He is also called the King of Glory, the Lord of Hosts, and the Prince of Peace. To the wicked he appears as a consuming fire; but to the faithful he becomes the Lord our righteousness, the Rock of ages, and the Saviour and Redeemer of his people. Yet, notwithstanding this variety of names which are given to the Divine Being, in both the Old and New Testaments, it is said by the prophet Zechariah, in allusion to the gospel-day, "In that day there shall be one Lord, and his name one." Chap. xiv. 9. Which I understand to mean, that there shall be *only one Divine power* acknowledged, to whom all these various names are attributed. The *name of the Lord* is often used in scripture, to indicate the power or the presence of the Lord. Thus it is said, "The name of the Lord is a strong tower." Proverbs xviii. 10. "Thy name is as ointment poured forth." Cant. i. 3. "For that thy name is near thy works declare." Ps. lxxv. 1. "Behold, I send an angel before thee to keep thee in the way. Beware of him, and obey his voice,—provoke him not, for he will not pardon your transgressions, for *my name is in him*." Ex. xxiii. 20, 21.

From these and many other passages, I think it is clear, that to be baptized into the *name of the Father*, and of the Son, and of the Holy Ghost, signifies to be brought under the purifying influence of that *one Divine power*, whose manifestations to the children of men are represented by these various names. I see no reason to conclude that the Father, Son, and Holy Spirit, are all distinct persons, because these names are all found in one sentence.

There are many other places in the scriptures where the Divine Being is mentioned under different names in one sentence. For instance, "Unto us a child is born, unto us a son is given; and the government shall be upon his shoulder, and his name shall be called Wonderful, Counsellor, the Mighty God, the Everlasting Father, the Prince of Peace." Is. ix. 6. Here are five names mentioned, and according to the trinitarian argument, they imply *five persons* in the Deity. The reduplicative style is very common in the sacred writings. For example, the apostle James says: "Pure religion and undefiled before God and the Father, is this." i. 27. And the

apostle Paul says: "Do all in the *name* of the Lord Jesus, giving thanks to *God and the Father* by him." Colos. iii. 17. He also speaks in another place "of *God, and of the Father, and of Christ.*" Col. ii. 2. From these expressions, some persons might conclude that *God and the Father* are two distinct persons; but the apostolic doctrine was, "There is but one God, the Father, of whom are all things, and one Lord Jesus Christ, by whom are all things, and we by him." 1 Cor. viii. 6.

3. The attempt to prove that there are three persons in the Deity, by saying that different offices are assigned to the Father, Word, and the Holy Spirit, will not stand the test of scrutiny: for the scriptures ascribe precisely the same works to the Deity under each of these titles. For instance, the work of creation is ascribed,—first, to *God*: "In the beginning God created the heaven and the earth." Gen. i. 1. Secondly, to the *Spirit of God*: "The Spirit of God moved upon the face of the waters." Gen. i. 2. "Thou sendest forth *thy Spirit*, they are created; and thou renewest the face of the earth." Ps. civ. 30. Thirdly, to the *wisdom* of God: "By *wisdom* he made the heavens." Ps. cxxxvi. 5. "The Lord by *wisdom* hath founded the earth." Prov. iii. 19. Fourthly, to the *Word of God*: "All things were made by him." John i. 3. By the word of God the heavens were of old, and the earth standing out of the water," and in the water. 2 Pet. iii. 5.—Fifthly, to the *Son* of God: "He hath in these last days spoken unto us by his Son, by whom also he made the worlds." Heb. i. 2. "God created all things by Jesus Christ."—Eph. iii. 9.

Here then, according to the trinitarian method of reasoning, are five persons concerned in the work of creation. But according to my view there is only one God, whose holy power of Divine influence is sometimes called the Spirit of God, or the Holy Spirit, because "God is a Spirit."—It is sometimes called the Wisdom of God; for "in him are hid all the treasures of wisdom and knowledge;" Col. ii. 3. It is likewise called the Word of God: because it is the medium by which he speaks to man. And it is called the Son of God, and Jesus Christ; because it was through this one Divine power that Jesus did the works of God. He said, "I can of mine own self do nothing; as I hear I judge, and my judgment is just; because I seek not mine own will, but the will of the Father which sent me." John v. 30. "The words that I speak unto you, I speak not of myself, but the Father that dwelleth in me, he doeth the works." John xiv. 10.

4. This brings us to the last point of the argument, which relates to the union of the Divine and human natures in Jesus Christ. This union I fully acknowledge; but I can see no need of calling it a hypostatical union; for there is no

such language used by the inspired writers, and I believe that this, and other Latin names, (such as trinity and triune God) have been used as blinds, to conceal from the public the deplorable ignorance of priests and professors in relation to divine things. They being ignorant of "that wisdom which is from above," (James iii. 17) have resorted to "the words which man's wisdom teacheth," in order to appear wise before men.

The scriptures tell us, that "as many as are led by the Spirit of God, they are the sons of God." Rom. viii. 14. "The Spirit itself beareth witness with our spirits, that we are the children of God: and if children, then heirs, heirs of God, and joint heirs with Christ." ver. 16, 17. They also teach us, that we may become "partakers of the Divine nature." 2 Peter i. 4.

This union which takes place between God and all those who are born of his Spirit, is so perfect, that the church (or assembly of the righteous) is likened to a spiritual house, of which Christ is the "chief corner stone." 1 Pet. ii. 5, 6. The apostle Paul, in addressing the Ephesians, says, "Ye are built upon the foundation of the apostles and prophets, Jesus Christ himself being the chief corner stone; in whom all the building, fitly framed together, groweth unto an holy temple in the Lord; in whom ye also are builded together, for an habitation of God through the Spirit." ii. 20–22.

The church is also compared to a body, having many members, of which Jesus Christ is the *head*. (Eph. iv. 15.—Col. i. 18,—Rom. xii. 4, 5—1 Cor. xii. 12.) It appears to me, that the apostles considered "the man Christ Jesus," (1 Tim. ii. 5,) to be the chief member or head of the spiritual body, which is made up of the faithful servants of God of all ages and nations: and therefore they speak of him as the "first-born among many brethren." Rom. viii. 29. This title does not refer to priority of birth, but to the dignity of his station; for the first-born son among the Jews was the head of the family or tribe, and the heir of his father's authority. Isaac was called the "only begotten son," because he was Abraham's heir, although his brother Ishmael was born before him. (Heb. xi. 17.)

With these views, I can fully acknowledge not only the Divine Word or Logos, which dwelt in Jesus without measure, and which constituted him the anointed Saviour, but I can likewise acknowledge the sinless perfection of his human nature. It appears from the scriptures that he was miraculously born of a virgin, and, though he "was in all points tempted like as we are, yet without sin;" (Heb. iv. 15) and he was "a man approved of God, by miracles, and wonders, and signs, which God did by him." Acts ii. 22. It is, however, very evident, that the "two natures were distinct" in him, as they are in all the sons of God; for it is not possible that the Divine na-

ture should suffer death, or be affected with agony of soul.

I can further say with the apostle Paul, "Henceforth know we no man after the flesh; yea, though we have known Christ after the flesh, yet now henceforth know we him no more." 2 Col. v. 16. And therefore, when I speak of Christ Jesus, or the Saviour, I mean that "unction from the *Holy One*," which reigned in Jesus, and "the manifestation" of which "is given to every man to profit withal:" 1 Cor. xii. 7; for, "of his fulness have all we received, and grace for grace." John i. 16. "In him was life, and the life was the light of men. That was the true light which lighteth every man that cometh into the world." ver. 4. 9.

This Divine power, or word of God, is often called Christ by the writers of the New Testament. For instance, Paul says of the children of Israel under Moses, that "they did all eat the same spiritual meat, and they did all drink the same spiritual drink; for they drank of that spiritual rock that followed them, and that rock was Christ." 1 Cor. x. 4.

Peter says that the prophets "prophesied of the grace that should come unto you, searching what, or what manner of time, the spirit of Christ which was in them did signify; when it testified beforehand of the sufferings of Christ and the glory that should follow." 1 Peter i. 11. There are a great many other passages in the New Testament, where Christ is spoken of as that one Divine Spirit who manifests himself in man for our sanctification and redemption. For example: "Know ye not your own selves, how that Jesus Christ is in you, except ye be reprobates." 2 Cor. xiii. 5. "To whom God would make known what is the riches of the glory of this mystery among the Gentiles, which is Christ, in you the hope of glory." Col. i. 27. "It pleased God to reveal his Son in me, that I might preach him among the heathen." Gal. i. 15, 16. "Ye are not in the flesh but in the spirit, if so be that the *Spirit of God* dwell in you. Now if any man have not the *Spirit of Christ* he is none of his." Rom. viii. 9. Here the Spirit of God and the Spirit of Christ, are spoken of as one and the same.

In confirmation of this, the apostle goes on to say, "And if Christ be in you, the body is dead because of (or as to) sin; but the spirit is alive, because of righteousness. But if the *Spirit of him* that raised up Jesus Christ from the dead, dwell in you, he that raised up Christ from the dead, shall also quicken your mortal bodies by his Spirit that dwelleth in you." ver. 10, 11. The same apostle says, "Because ye are sons, God hath sent forth the spirit of his Son into your hearts, crying Abba, Father." Gal. iv. 6. And again he says, "The Lord is that Spirit, and where the Spirit of the Lord is, there is liberty." 2 Cor. iii. 17. I might adduce many other pas-

sages, to show that when the apostles speak of Christ, they often mean the *anointing power* of God's Spirit, or "the law of the spirit of life in Christ Jesus, which makes free from the law of sin and death," that "wars in our members."—Rom. viii. 2. and viii. 23. It is evident, that Jesus spake of his outward body merely as a temple in which this Divine power was manifested; for he said, "Destroy this temple, and in three days *I will* raise it up." "But he spake of the temple of his body." John ii. 19–21. In this prediction he spoke in the name of his Father; for it is said in the scriptures that "he was raised up from the dead by the *glory of the Father*." Rom. vi. 4.—"This commandment have I received of my Father." John x. 18. And after he was risen, he said to Mary, "Go to my brethren, and say unto them, I ascend unto my Father and your Father, and to my God and your God." John xx. 17.

John. It appears that the same body which was crucified, rose again and ascended up to heaven, and now sitteth on the right hand of God; for he said, after his resurrection, "A spirit hath not flesh and bones, as ye see me have:" which shows that it was a human body. And it is also said, "He was taken up, and a cloud received him out of their sight." Acts i. 9.

(To be continued.)

The following brief notice taken from a Bucks County paper truly delineates the character of our departed Friend, MARY K. JANNEY.

We cannot but express the desire that in the remembrance of her many virtues, we may be stimulated to seek that faith which overcomes the world, that at the midnight cry, our lamps may also be "trimmed and burning."

In reading the notice of the death of MARY K. JANNEY, of Newtown, I regretted that one so loved and whose life was so rich in example, should have passed away without comment. I had been hoping that an abler pen than mine might speak of those virtues which her daily life vitalized, and which she cultivated with so much earnestness of purpose, that, like flowers, they blossomed by the wayside, giving fragrance and beauty to the simplest household care, and that deeper significance to life, in the performance of each little act of love or duty.

No one could breathe the atmosphere of her home, and listen to her conversation for an hour, without feeling the moral elevation produced by association with a pure and fervent spirit. Her humility, her ready sympathy, her quick sensibilities, her highly cultivated mental endowments, and the fervency of her religious aspirations, made her an ornament in society, and a loved and valued friend.

Hers was the "faith that overcomes the world!"

her lamp was always trimmed and burning; and to her it was great gain to burst the shackles of mortality, and experience the full enjoyment of the saint's rest. Ever faithful to the teachings of the spirit of Truth manifested in her, she spoke to us in rebuke, in warning or in earnest persuasive words, to live a truer life, and to taste of the goodness and mercy of a Heavenly Father's love; and I trust, that the spiritual seed sown has not all fallen on barren ground, but will yield an abundant harvest of good works. "But the silver cord is loosened, the golden bowl is broken, and we sorrow most that we shall see her face no more."

For Friends' Intelligencer.

FRIENDS' SCHOOLS.

The want of good practical schools for the guarded education and proper moral training of the youth of our Society, has never been more painfully forced upon my attention than within the past few weeks. The unaccountable indifference manifested by many of our members on this all-important subject is greatly to be deplored, and is, I fear, materially affecting our religious welfare as a body. The influence of well-conducted institutions of learning upon families, communities and neighborhoods can scarcely be estimated, and it is to be hoped the time is not far distant when this subject will receive the attention it demands. It may not be inappropriate to recall the excellent advice contained in our Discipline under the head of Schools. "It is therefore proposed,

"First. That a lot of ground be provided in each Monthly or Preparative Meeting, sufficient for a garden, orchard, grass for a cow, &c., and a suitable house erected thereon.

"Second. That funds be raised by contributions, bequests, &c., in each meeting; the interest of which to be applied either in aid of the tutor's salary, or lessening the expense of Friends in straightened circumstances in the education of their children.

"Third. That a committee be appointed in each Monthly or Preparative Meeting, to have the care of schools and the funds for their support, and that no tutor be employed but with their consent. Although the raising a sufficiency to answer those purposes may in some places appear difficult, yet as improvements of this kind are generally gradual, and have often arisen from small beginnings into very valuable establishments, it is desired that Friends may be encouraged thereto, and keeping an eye to the Divine blessing on their benevolent endeavors, make such essay for carrying into effect these recommendations as they may be enabled."

I have recently attended a number of meetings in different settlements of Friends, and upon inquiry could not ascertain that in any one in-

stance provision had been made for securing to the children and youth the guarded education which our Discipline enjoins. Two, at least, of our sister Yearly Meetings are altogether silent upon the subject of Schools. Parents excuse themselves upon the ground that their taxes are onerous, and they do not feel that they can incur the additional expense of supporting a Monthly or Preparative Meeting school; so their tender offspring are exposed, at an age when their minds are most susceptible of impressions, "to the care of transient persons of doubtful character," and may thus not only become alienated from our religious testimonies, but be led to embrace principles at variance with our profession. We certainly sustain a great loss by not cherishing "a disposition of liberality for the assistance of each other in this important work." If we conscientiously believe our principles and testimonies are founded in truth, how can we feel excused from placing our children in circumstances where they will be agreeably presented to them.

In comparatively few instances are district schools so conducted that Friends can consistently send their children to them. In interior localities, especially, the small remuneration offered is insufficient to command the services of competent teachers, and the literary advantages of the pupils merely enable them to read intelligibly and write with effort. The mind, however active, cannot fully develop under an education thus defective; their opportunities of usefulness are necessarily abridged, and society suffers in consequence. Not that I would suggest that any amount of scholarship can confer spiritual grace, or the ability which only God giveth "to divide the word aright;" but there are duties incumbent upon each and all of us, in the church and out of it, which demand the highest exercise of all our talents, and involve a responsibility to employ them to the glory of the great Giver. Are there not neighborhoods in which family schools can be established more in accordance with the wants of Friends, without greatly increasing their pecuniary burdens? there are many young persons among us who desire useful employment, and who are well qualified to engage in such a field of labor. Is it not indispensably incumbent upon us, not only to provide schools of this description, but "to procure such tutors of our own religious persuasion as are not only capable of instructing them in useful learning to fit them for the business of life, but to train them in the knowledge of their duty to God and towards one another?" H.

Philada., 7th mo. 5, 1859.

Religion is the fear of God, and its demonstration good works; and faith is the root of both: "For without faith we cannot please God," nor can we fear what we do not believe.—Penn.

VOICES OF THE NIGHT.

"O Night and Darkness, ye are wonderous strong!"

Night! its meaning, its place in the economy of things, its proper use as a means of improvement and spiritualization, is a theme which may well claim our earnest attention. It is the more necessary that we attempt to unfold its lesson, because it is often regarded as having no lesson at all. The hours of darkness are considered as a blank in human existence. Night, darkness, sleep, have passed into human language as representative of ignorance, death, annihilation, and the grave. But it is hardly conceivable that one half the time allotted to man has no important place in his probation. We read that in the beginning God arranged the night as well as the day, parting one from the other, fixing to each its limits, and extending over it his protecting providence. He might have banished the darkness entirely from his dominions, instead of so shaping the worlds and so poisoning them on their axes that they shall dip with endless alternations into the light and the shade. He would have so arranged, if, while the one is simply and positively good, the other were simply a negation of good, having no other purpose than to put men to rest and steep the world in oblivion. Not only men and animals, but the whole vegetable kingdom, are so constituted as to pass into those alternate states which require the ministrations of the night and the day. If my object were to excite no more than our admiration and wonder, we might pause to examine that divine mechanism by virtue of which every leaf and flower, at the approach of eventide, send back their juices towards the seat of life and fold themselves to rest; but my object is rather to develop the moral significance of night, and show its bearing on the well-being and regeneration of man.

I. And can you conceive of an arrangement which calls more irresistibly to self-inspection, than that under which the day fades away into darkness? Gradually do the objects which glared in the sunshine disappear, until the whole outward world is taken from us and we are left alone with ourselves! We were in the midst of noise and business; what was external absorbed our whole attention; when lo! the solemn curtain descends and shuts the external from our view, and hushes every noise upon the landscape and over the peopled earth. If a voice had come audibly out of the heavens, saying, "Turn thine eyes from without and look within thee," its meaning could not be more clear. The man bearing within him the memory of crimes unrepented of and undivulged, who can pass alone through the first hours of darkness with no troubled sensations, has probably sunk below the possibility of reformation. Hence this is the hour when such persons attempt to flee the necessity of self-communion.

At this hour a man must converse with his own thoughts, and he may be surprised to find that his thoughts are not abstractions, but living people issuing out of the secret places of his own breast and revealing the mysteries that lurk there. In the splendors of daylight a thousand objects call away his attention and absorb it in the outward world. But daylight gone, and external things blotted out, the inner world has nothing to overlay its creations, and so they come out without hinderance and disguise. This arrangement of Providence, by which we are drawn alternately to the things of the external and the internal man, is adapted to the purposes of self-knowledge and self-improvement as no other arrangement could possibly be. If no occasions were presented but those of the daytime for this descent of the mind into its own recesses, and for its more exclusive presence with spiritual things, men would become at length entirely external, and perhaps grossly carnal. By and by they would live in the senses altogether. Now they cannot if they would, and probably no one of us is conscious how great may be the effect upon our characters from being left with such frequent alternations into our our spirits, whether we would or no. Have you never experienced how involuntarily the mind adapts itself to this arrangement, how in the first coming on of the darkness, when "shadows from the fitful fire-light dance upon the parlor-wall," the mind instinctively reverts to the past, opening all the storehouses of memory, and calling up their images in a never-ending train? It is just the reverse of this in the morning; then we are full of the future, then our own thoughts and plans dart forward and outstrip the hours. One is the period when the foretime waits to be evoked and reviewed, the other when the aftertime is to be anticipated and provided for.

Now if we would avail ourselves fully of this arrangement of Providence, few things would so help on the work of regeneration within us. Every evening the events of the day would pass before us in solemn review. Its silent shadows would fall around us to invite us to the duty of self-examination; until the style of our secret thoughts had been disclosed to us, and memories of our past ingratitude and impenitence had melted our hearts into tenderness. Every day ill spent would work repentance and reformation at its close, and God, who had been forgotten in the temptations of business, would reveal himself when the busy scene was withdrawn, another sun coming down through the evening sky with higher and more interior illuminations. Not a day would pass without its review, not a night would come on to blot from our senses the outward universe, without making the objects of faith rise more vivid on our sight. And we should find, every time the outward world was withdrawn, that the spirit-world was nearer than the night before, so that

we "pitch our moving tent a day's march nearer home." Here, especially, where there is so much of reckless hurrying on in the march of life, and such downward tendencies into sensualism, so little of meditation and so much of bustle and action, there is especial need that we listen to these voices of the night that call us to seek a knowledge of ourselves.

2. Such is the lesson of the first hour of the night, nor is the one of the hour that follows less instructive and holy; for then the hand of God unrolls the sun-strewed firmament which pours over the earth its serene and eternal blaze. I suppose the thoughts and meditations produced by the sight of these higher heavens will depend upon one's previous habits of mind; but it has always seemed to me that the great spiritual idea which they impress upon us is that of *contrast*,—contrast between our realizations and our hopes, between the state in which we are, and the state to which we aspire with unsatisfied longings. In the daytime we strive and toil in the petty competitions of the hour, we run with hot haste after trifling objects, we exult and triumph when we have attained them, and we vex ourselves with bitter disappointment when the stake is lost. We labor in the hot sun, in the dusty ways of life, and our little strivings become to us of supreme moment. But in the midst of our contentions the darkness descends and blots out our little world of cares, and away through infinite depths we gaze into a region where all is tranquillity and peace. How contrasts the majestic silence above with the petty strifes beneath! How the firmaments have moved on together ever since time began, and yet no sound among the "rapid travellers"! How enlarged to infinity is the space we move in, when a little while ago our sphere of labor was all in all! The drop of starlight which falls upon my eyeball travelled a thousand years before it reached me, and I stand in my little place of labor like an insect that inhabits a single leaf that flutters in the foliage of boundless woods. O the unbroken stillness and tranquillity of the heavens, contrasting their eternal harmonies with our temporal discords, giving us the idea of infinity for our low and narrow views, and of everlasting peace above all earthly trouble! The Christian has given the name of Heaven to the abodes of future rest: the word means literally the arch that is raised or *heaved* above us, and we take it to describe our future state because it gives to us the image of eternal repose. None can tell how great has been its influence in keeping in our minds the idea of the rest of immortality, and drawing our aspirations thither, because every night it spans the turmoil of earth with its deep and boundless tranquillity.

Do what good thou canst unknown; and be not vain of what ought rather to be felt than seen.

SOME EXTRACTS FROM THE WRITINGS OF OUR DECEASED FRIEND, JACOB L. MOTT.

Happiness of Resignation.

Man is so sensitive in his nature, that he is frequently pierced by the arrows of affliction; however calm the sea of life may appear when his frail bark is first launched upon its bosom, he will ever find it more or less tempestuous—none sail beneath a cloudless sky. Although our blessings may be numerous, yet all experience a degree of sorrow. Trials and conflicts come upon all, and all our efforts to shun them will be vain. It is not judicious, then, for man (while passing through this state of probation) to contend with the course of Providence, because it afflicts him; this is frequently the temptation of fault-finding, erring man, and is as foolish and unprofitable as it is sinful. It cannot alter his purposes; God's providences will ever remain the same, whether we approve or not. He who is sick cannot cure his disease by impatience, or if he has lost a friend cannot re-animate his lifeless dust by disputing the equity of the allotment. Thus to treat his providences, is sure to add poignancy to grief, and while it introduces new elements of pain, incapacitates the mind to receive the consolations of truth. Then those are wise who bow in resignation to the dispensations of the great Jehovah.

A patient endurance of that which we cannot avoid, and a firm trust in God, believing He is too wise to err, are the true conditions of the sufferer. If trials beget fretfulness and complaining, they will be doubly severe. But if we meet them in the spirit of humble resignation, we shall enjoy life more, and sin against God less.

The patriarch Job, who was eminently wise, as well as virtuous, said, "The Lord gave and the Lord hath taken away; blessed be the name of the Lord."

Our Creator (for our good and his glory) has placed us here in a state of probation, exposed us to temptation, and so constituted us that we are unable to resist them without His assistance, yet he has not left us to an unequal combat. Satan may tempt but cannot force us to yield, although in our own will and strength we cannot overcome our adversary. I, for one, do not wish to do so, and am willing to be tried as gold in the fire, and as acceptable men and women, in the furnace of affliction. I am willing that God shall have the praise of my preservation and the glory of my victory. I know He "will not give his glory to another nor his praise to graven images," and in this warfare that I can do nothing without him.

This state of probation will soon pass away, yet sufficient time and ability are given us to work out our salvation, and we are inexcusable if we neglect to occupy them; for when we leave this

world and enter the ocean of eternity, we shall hear either one or the other of these solemn sentences, "He that is filthy let him be filthy still; or he that is holy let him be holy still;" and this day of retribution is hastily approaching us all. It is written, "Behold I come quickly, and my reward is with me, to give every man according as his works shall be."

Then magnified over all and praised forever be the great name of the Lord; thanksgiving, glory, and honor be ascribed unto Israel's God, the guide, governor and preserver of all those who put their trust in Him. There is no enchantment or divination that can prevail against Israel, so long as he abides in his tent; and God is his tent, "therefore to thy God, Oh Israel, strong and mighty, thy only sure rock of defence." Oh, if we abide here we are safe forever. "Thy bread shall be given thee and thy water shall be sure."

"Affliction cometh not forth out of the dust, neither doth trouble spring out of the ground."

Unspeakingly wise is our Heavenly Father in his dispensations to his children; he knows what is necessary to incite them to diligence in seeking after heavenly treasures. Although at times we murmur when He metes out blessings in the form of afflictions, that we may renew our labors for greater dedication to Him, we shall, ere long, discover they have taught us to expect much less from the world, and have increased our own love to the one great object of eternal good.

We shall have to say as David did, "One thing have I desired of the Lord—that will I seek after, that I may dwell in the house of the Lord all the days of my life—to behold the beauty of the Lord, and inquire in his temple, for in the time of trouble he shall hide me in his pavilion, in the secret of his tabernacle shall he hide me." "Take up thy cross and suffer it to crucify thee to the world and the world to thee," was the command of our Lord and Master Jesus Christ. This must be done before we can be prepared for his service, or share with him his kingdom. He patiently endured affliction, and was a man of sorrow, and acquainted with grief. Let us remember, then, "It is enough for the disciple to be as his master and the servant as his Lord."

What constitutes the christian? What does the term signify? I answer—following Christ and imitating him. Jesus Christ was a complete model of patience, love, goodness and mercy, and the christian must believe in his testimonies. He has said, "On love to God as supreme, and our neighbors as ourselves, hang all the law and the prophets;" also, "Love your enemies and pray for them." This and nothing less than this will do for us. "For one jot or tittle of the law shall not pass away until all be fulfilled." The apostles had before them the bright example of their Divine Master, and all they had to do was to follow to it. They therefore labored, look-

ing unto Jesus, who, for the joy which was set before him, endured the cross, despising the shame; and who said, "I of myself can do nothing—the words that I speak are given me of my Father."

Example has an influence with man which is hard to counteract. The apostles loved their Divine Master, and the truth which he had committed to them, as well as the labor to which they were appointed; and, moreover, they rejoiced that they were considered worthy to suffer for His sake. In full possession of such love, who can wonder that they were not discouraged? The opposition which they had to encounter, instead of weakening them, gave them joy, and filled them with courage which no danger could intimidate. What can overcome this love? it is stronger than death. "Because I live, (said Christ to his disciples) ye shall live also." "At that day yeshall know that I am in my Father and you in me and I in you." It is because he lives and communicates his spiritual life to his followers that they live also. In this sense it is that he says, "I am the way, the truth and the life; no man cometh to the Father but by me;" also, "I am the door into the sheepfold." Let us understand—Christ, the Son of God, the Immanuel God with us, is the way, the door into the sheepfold.

How beautifully did Jesus call the attention of the people to a power within themselves, when he told them, "The kingdom of God is within you." He spake of the seed that the sower went forth to sow; of the leaven that was placed in three measures of meal, and by many parables and figures directed them to the cultivation of the principles of righteousness.

Are we not satisfied that if the precepts and doctrines of the Holy Jesus were maintained in our daily walks through life, and our conduct regulated by the principles of love, mercy, justice, and truth, we should experience a much greater degree of enjoyment in the exercise of those heavenborn virtues, than we shall if we neglect to cultivate them?

(To be continued.)

AN ARAB STORY WITH A MORAL.

In the tribe of Neggdah, there was a horse whose fame was spread far and near, and a Bedouin of another tribe, by name Daher, desired extremely to possess it. Having offered in vain for it his camels and his whole wealth, he hit at length upon the following device, by which he hoped to gain the object of his desire. He resolved to stain his face with the juice of an herb; to clothe himself in rags; to tie his legs and neck together, so as to appear like a lame beggar. Thus equipped, he went to wait for Naber, the owner of the horse, who he knew was to pass that way. When he saw Naber approaching on his beautiful steed, he cried out in a weak voice, "I am poor, stranger; for three days I

have been unable to move from this spot to seek for food. I am dying; help me, and Heaven will reward you." The Bedouin kindly offered to take him up on his horse and carry him home; but the rogue replied: "I cannot rise; I have no longer any strength left." Naber, touched with pity, dismounted, led his horse to the spot, and, with great difficulty, set the seeming beggar on his back. But no sooner did Daher feel himself in the saddle, than he set spurs to the horse and galloped off, calling out as he did so, "It is I, Daher; I have got the horse, and I am off with it." Naber called after him to stop and listen. Certain of not being pursued, he turned and halted at a short distance from Naber, who was armed with a spear. "You have taken my horse," said the latter. "Since heaven has willed it, I wish you joy of it; but I conjure you never to tell any one how you obtained it." "And why not?" said Daher. "Because," said the noble Arab, "another man might be really ill, and men would fear to help him. You would be the cause of many refusing to perform an act of charity, for fear of being duped as I have been." Struck with shame at these words, Daher was silent for a moment; then springing from the horse, returned it to its owner, embraced him and invited him to his tent, where they spent a few days together, and became fast friends for life.

CAUSES AND CONSEQUENCES.

Remember that lofty trees grow from diminutive seeds; copious rivers flow from small fountains; slender wires often sustain ponderous weights; injury to the smallest nerves may occasion the most agonizing sensation; the derangement of the least wheel or pivot may render useless the greatest machine of which it is a part; an immense crop of errors may spring from the least root of falsehood; a glorious intellectual light may be kindled by the minutest sparks of truth; and every principle is more diffusive and operative by reason of its intrinsic energy than of its magnitude.—*Dr. Gregory's Farewell Address.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SEVENTH MONTH 16, 1859.

DIED, on the 21st of 6th mo. 1859, of paralysis, DANIEL SMITH, in his 80th year. He was an exemplary member of Gwynedd Monthly and Norristown Particular Meeting. The interment took place at Plymouth, and a solemn meeting was held on the occasion.

It may be truly said of our beloved Friend, that he was gathered like a shock of corn fully ripe. Mark the upright man, behold the end of that man is peace.

—, on 26th of 4th mo. last, RUTH LAMBORNE, wife

of Josiah Lamborne, aged 75 years, a member of the Sadsbury Monthly Meeting of Friends.

From the Edinburgh Review.

FEMALE INDUSTRY.

(Continued from page 268.)

The first head of industry is always Agriculture. The Americans pride themselves on employing no women in agriculture, and are exceedingly scandalised at the sight of the peasantry in continental countries tilling their ground in family concert—the women and girls working there with their husbands and brothers. It may be questioned whether the yeoman's wife in New England, and the back settler's daughters, have an easier life of it than the German peasant-women, or the Devonshire laborer's wife, or Highland lassies at a shearing. Considering the maple sugar making, the soap-boiling, the corn-husking, &c., we should doubt whether any women work harder than some who would on no account be permitted to handle a hoe or rake. However that may be, there seems to be no doubt of agricultural labor being relished by English women, and of its being, on the whole, favorable to health and morality. Health is morality, to begin with; and, if the woman's labor improves the family diet, and subscribes to the clothing club, while bacon and new shirts would be out of the question from the husband's labor alone, the fact may be less deplorable than a well-to-do young republic may consider it. If the children are not at school, they are with their mother in the field; and this is better than the fate of the town child, whose mother is out at work. It is not, then, to be regretted that the proportion of women employed in agriculture seems increasing in England. No census affords the means of more than an approximate estimate of the numbers, because we have not yet been told (as we must hope to be in 1861), how many of the rural laboring class become domestic servants. In the 'Industrial and Social Position of Women,' we find this statement:—

'Going through the necessary calculation, we are led to the following conclusions, viz., that, of the whole number of domestic servants, nearly two-thirds are born in rural parts; that the agricultural class, although little more than half as numerous as the classes engaged in trade, commerce and manufacture, sends out nearly twice as many domestic servants; that of the women of town families engaging in independent industry, about one-third become domestic servants; and that, of the women of country families engaging in independent industry, six-sevenths become domestic servants. To a great extent, therefore, the women of the rural classes monopolise that situation both in town and in the country.' (P. 192.)

According to the census of 1841, there were then 66,329 women, above twenty years of age,

employed in agriculture, without reckoning the widow-farmers (who are not few), or the farmers' wives. The late census gives 128,418 as the number so occupied, exclusive of the 'farmers' wives' and 'farmers' daughters,' who are specially, but perhaps not completely, returned as being 289,793. Of the independent female agricultural laborers, about one-half, or above 64,000, are dairy women. Neither in America, nor anywhere else, would dairy work be objected to as a feminine employment, conducted within doors, as it is, and requiring feminine qualities for its management; yet it is harder work, and more injurious to health than hoeing turnips or digging potatoes. 'No end of work' is the complaint; and it is not an unreasonable one. On a dairy-farm, the whole set of labors has to be gone through twice a day, nearly the whole year round; and any one of our readers who has seen the vessels on a Cheshire farm, the width of the tubs, the capacity of the ladles, the strength of the presses, and the size of the cheeses, will feel no surprise at hearing from the doctors that dairywomen constitute a special class of patients, for maladies arising from over-fatigue and insufficient rest. There is some difference between this mode of life and the common notion of the ease and charm of the dairymaid's existence, as it is seen in the corner of a Duchess's park, or on a little farm of three fields and a paddock. The professional dairywoman can usually do nothing else. She has been about the cows since she was tall enough to learn to milk, and her days are so filled up, that it is all she can do to keep her clothes in decent order. She drops asleep over the last stage of her work; and grows up ignorant of all other knowledge, and unskilled in all other arts. Such work as this ought at least to be paid as well as the equivalent work of men; indeed, in the dairy farms of the West of England, the same labor of milking the kine is now very generally performed by men, and the Dorset milkmaid, tripping along with her pail, is, we fear, becoming a myth. But even in Cheshire the dairymaids receive, it appears, only from 8% to 10% a-year, with board and lodging. The superintendent of a large dairy is a salaried personage of some dignity, with two rooms, partial or entire diet, coal and candle, and wherewithal to keep a servant—50% a year or more. But of the 64,000 dairywomen of Great Britain, scarcely any can secure a provision for the time when they can no longer lean over the cheese tub, or churn, or carry heavy weights.

Ireland has to be treated separately in all these surveys, from her having had no place in the census; and yet, in considering the female industry of the United Kingdom, that of Ireland is the most prominent, and commands the most surprise. It will be ever memorable that during the transition period, in which Ireland pas-

sed over from destitution and despair to comfort and progress, the nation was mainly supported by the industry of the women. Our readers may remember the 'Cottage Dialogues' of Mrs. Leadbeater,—a homely book which shows what rural life in Ireland was like before O'Connell broke up the good understanding formerly existing between the landlords and the peasantry. That book represented the ordinary life of the peasant women, spent in the field or the bog, or in managing the manure and the pig at home. In the succeeding period, and after the famine, the desire for the lowest-priced labor led to the employment of women and children; and the strange spectacle was then common of the women toiling on the farms or pastures, while the strong men were nursing the babies and the grannies at home. It was not only, nor chiefly, the agricultural labor however which fed the peasantry, before the men resumed their proper place. The Scotch merchants employed 400,000 women and girls in 'sewing,' or what English ladies call 'working' muslins. The Glasgow employers paid 90,000% a week in wages for this Irish work. A good deal more was earned by other kinds of fine fabrics. On the whole, the change from out-door labor to this seemed to be unfavorable to health in one direction, and favorable in another, while the social benefit was undisputable. The sedentary employments were less wholesome than the laborious one; but the homes became cleaner and more comfortable. There is nothing in needlework, any more than in dairy-work, to make a woman a good housewife; and the Irish peasant woman had yet another step upwards to make, to constitute her the laborer's wife that we may hope to see her; but the pig no longer shared the cabin, and the children were not tumbling about in the midden all day. The family diet is of a higher order than the old potato; and, as one consequence, there is a stronger demand for dairywomen. The land which used to be sub-let for potato grounds is more and more devoted to the service of the butter-merchants, causing an expansion of female industry in that direction. Whenever cheese is added, there will be still more for Irish women to do. It is odd that the inkeepers in the most rural districts of that island have to get every ounce of their cheese from England. Even without this prominent kind of women's work, the female industry of Ireland must be very great. It is not less now than when it nearly supported the population, though the men have again taken the lead in the toils of life, and their reward.

In connexion with agricultural labor we should consider the rearers of poultry, pigs and lambs; the makers of cider and perry; and the bee-mistresses, who gain a living by their honey in many rural districts. The enormous importation of eggs from the continent, and especially from

France, shows that there is more work for women yet in this direction : but the reigning passion for poultry-yards must result in a great diffusion of the knowledge and skill which the upper classes are cultivating so diligently. In addition to the twenty thousand female farmers and land-owners of England, and the half-million and more of 'farmers' wives and daughters,' a separate class of poultry-women will soon be able to make a good subsistence out of eggs and chickens. Then there are the market-gardeners—thousands of women most admirably employed. There are the florists and nursery-gardeners,—not unfrequently Quakers. It is a pretty sight,—a good nursery-ground and set of conservatories, under the charge of a sensible Quakeress, whose shrewdness penetrates the whole management. There are the flax producers too,—not a small number, if we include the care of the crop, the pulling, steeping, beetling and dressing, and bringing to market; and, as 60,000 acres of Irish land are annually under flax, and as 500,000 acres would yield no more than is wanted; and as millions of pounds sterling (2,000,000*l.* in ten years) have been wasted in buying an impure seed from abroad when it might easily be obtained at home, we may conclude that flax-producing is, or might be, an extending branch of female industry. We may add that the demand for labor will increase, instead of diminishing, when the farmer consigns the preparation of the flax to establishments organized for the purpose, instead of insisting on doing it at home, and sinking in the market. At present, the women are in one place, poking in the ditch or pond at home amidst an insufferable stench, and waiting on the weather for days or weeks; and then beetling with the old-fashioned instrument; while in another place they are about the same work in scutching-mills, to far greater advantage. The steeping, done without the stench of decay, and in a few hours or days in vats; and the dressing by patent machinery, are proper work for women, and will, no doubt, employ more and more of them,—especially as a great deal of seed is saved by the process. It is worth while to spend 170*l.* in labor to save 1,200*l.* in seed; and, as we spend 300,000*l.* in importing seed, the prospects of labor in the flax-producing department are well worthy of notice. When we have mentioned the itinerant classes of female agricultural laborers,—the hay-makers, reapers and binders, and the hop-pickers, we have reviewed, in a cursory way, the whole of that division of female industry.

On the whole, its prospects are good. The introduction of Agricultural machinery does not at first please the Irish hay-maker, the Scotch reaper, the Berkshire bean-setter, or the Norfolk turnip-hoer; but neither did their grandfathers like the threshing-machines in the days of Far-

mer George. Time and patience show that the results of that particular change are two, among others,—an increased demand for labor, and an elevation of the character of the employment,—two very good things in view for the scores of thousands of our country-women who are engaged in agricultural processes of one kind or another.

Next to those who draw commodities from the surface of the land should come those who draw commodities from its depths,—the women engage in mining processes. We are happily spared the dismal chapter of coal-pit life which we must have presented a few years ago. It is true, the desire for an independent maintenance,—the popular craving for wages,—causes a good deal of evasion of the law; and women do get down into the pits in disguise, or by connivance; but the employment of women in coal pits is no longer a recognized branch of industry among us. Who then are the 7000 women returned in the census under the head of Mines?

They are, no doubt, for the most part, the dressers of the ores in the Cornish and Welsh mines. The work is dirty, but not too laborious;—less laborious than the work which may perhaps be included under the same head,—the supplying porcelain clay from the same regions of the country. Travellers in Devonshire and Cornwall are familiar with the ugly scenery of hillsides where the turf is broken up, and the series of clay-pits is overflowing, and the plastered women are stirring the mess, or sifting and straining, or drying and moulding the refined clay. The mineral interest is, however, one of the smallest in the schedule of female industry; and it is likely to contract rather than expand,—except the labor of sorting the ores.

Next to the produce of the land comes that of the waters. Here again, scores of thousands of women find employment (otherwise than as fishermen's wives and daughters,) within our four seas. It is true the amount of fish-eating in our country by the lower classes of the population is inexplicably small. No one seems yet to have accounted for the neglect of, or prejudice against, a kind of food so excellent and so abundant. But the demand created by railway carriage, and by the removal of various restrictions, bids fair now to restore something like the fish-eating of the old Catholic days. A few years since, tons of good fish were buried in the sands of the coast, because they could not be disposed of while they were fresh, though the price in the neighboring districts was so high that fish came to be considered a delicacy for the rich. The ponds of old abbeys and mansions had fallen into ruin; the river fish were dwindling in number and quality; and the uncertainty of the great coast and deep sea fisheries became so extreme as to render that branch of commerce a mere lottery. Through all this, the fish-women of all kinds stood their ground, with more or less difficulty

We do not mean only the sellers,—the celebrated Billingsgate fair, or the Musselburgh dames, and the Claddagh women. The shrill voices of the fishwomen all round the coast, and in all the ports, will forever forbid their being forgotten when the independent industry of women is in question. They seem to be appointed to show how independent industrial women may be. A far larger number, however, are employed in the curing, and even in the catching of fish; and these held on through bad times and good times; but it is supposed, in decreasing numbers till a new period set in. We need not describe the change wrought by the railway system, which scatters fresh fish all over the country, so that you may meet a man on the Yorkshire hills with a string of mackerel, or enjoying his haddock or fresh herring in the midst of a sporting country in the heart of England. The new arrangements for the protection of salmon, and for pisciculture, in imitation of the French practice, point to a steady growth of fish-eating at home; and the extension of our colonies, and of new settlements all over the globe, ensures an increased demand for the staple of our great sea-fisheries. The pilchard fishery, confined (with pilchard eating) to two counties and exportation to Italy, employs thousands of women. Jersey oysters alone employ 1000 women, and this may give us some idea of the amount of independent support afforded to women by our herring and cod fisheries (which last includes a variety of kindred sorts); the mackerel and oyster, and lobster fisheries round our coast,—to say nothing of the remote cod and turbot,—and the whale fisheries, in which the women take a part when the cargoes return. There are probably few of us who have not seen more of this direction of industry than of manufactures and commerce in which women are the laborers. In every seaside place we have seen the women and girls pushing their shrimping-nets through the little lagoons on the beach, or visiting the lobster traps at low water. In the Scotch islands, and on many an Irish promontory, we have seen the curing-houses where rows of women were at work in a way suggestive of Red Indian life, where the squaws sit cleaning their fish on the margin of Lakes Ontario or St. Clair. The further north we go on our own island, the more we find the women habituated to marine industry, as well as to preparing its products for the markets. From Berwick to the Ork of Caithness, the hardy race of men who fish the German Ocean, are bred and nurtured by a race of women as amphibious as themselves, busy all the-year round in mending nets, vending fish, or salting and curing the 'craus' of autumnal herrings. They swarm along the bleak coast of Aberdeen, and they give at some seasons the activity of a vast manufactory to the little harbors Helmsdale and Wick. In the sea-lochs and western islands of Scotland, it is common for

girls to ply the oar, whether at ferries or in the fishery. The art which young ladies now practice on the still waters of their fathers' pleasure-grounds, as an exercise to open the chest, the daughters of England, all along her coasts, and yet more those of Scotland, have practised as naturally as walking, all their lives. Here the memory of Grace Darling will rise in all hearts,—as it ought; and with it the protest she made against her being singled out for fame, on account of an act which she declared to be very common. Notwithstanding that protest, some of us prize above most of our cabinet treasures, the statuette from the Northumberland monument, which represents her sleeping after her battle with wind and tide, with her oar at rest upon her arm. Yet more do we prize the immaterial monument raised to her in that crypt within us, wherein great deeds are laid by for eternal remembrance. Not the less, but the more, for her protest against her own fame, is she become the type of a class of our hardy countrywomen, who are good angels in storm and shipwreck. As long as her monument remains, it should be remembered that she received her renown with grief and remonstrance, 'because,' as she said, 'there was scarcely a girl along the coast who would not have done as she did.'

(To be continued.)

From The Cleveland Leader, June 7.

TWO DAUGHTERS EMANCIPATED BY THEIR FATHER

In the Summer of 1857, James Oldham, a "free white citizen" of Coahoma County, Mississippi, left his plantation near Friar's Point, with his two beautiful daughters—one of whom is now 12 and the other 16 years of age—for Oberlin, Ohio, whither he came for the double purpose of emancipating and educating the girls, for they were his slaves. He was accompanied by Miss Hattie Oldham, a near relative, who came to assist in locating the daughters in their new condition.

At Memphis, the younger daughter, Cyrena, having been the pet of the family, and preferring the known ease of her sunny home to the fancied trials and the dreaded restraints of school, could not be persuaded to come any further on the journey, and her kind father was induced to permit her return to the plantation, while the balance of the party came on and arrived at Oberlin in August.

The next day after their arrival, Mr. Oldham was attacked with typhoid dysentery, and was soon reduced to a critical condition, in which he lingered for three weeks and died. Having formed an acquaintance with Dr. R. L. Rea of Oxford, Butler County, Ohio, and having great confidence in his skill as a physician, at Mr. Oldham's request the Doctor came to his bedside,

watched over him until death ended his sufferings, and then accompanied his mortal remains back to his desolate home in Mississippi.

When Mr. Oldham became convinced that he must die, his concern for the freedom of his youngest daughter was intense. The eldest, Emeline, was with him in Ohio, and was therefore free; but the younger by lingering amid the loved scenes of her childhood, was exposed to be inventoried among the other chattels of the estate, and sold at a high price because of her light complexion, her beautiful ringlets and her graceful form, and the dying father knew it, and bitter anguish stung his soul.

He knew, too, that the laws of Mississippi forbid emancipation, within her borders, and further, that he could not by his will make her free to be sent out of the State; nor could he will her in trust to another for the purpose of making her free; neither yet could he sell her to any one for that purpose. Thus was the dying parent beleaguered on every hand by the monstrous cruelty of the law, hedging up as it does every way by which he might secure freedom to his child, and thus save her from a dreadful fate. In this strait he applied to the Hon. Philemon Bliss, of Elyria, for counsel, whose clear head and warm heart were soon enlisted in what would seem the hopeless task of enabling a wealthy father to free his own child from eternal Slavery.

A will was soon executed, in which the facts of the parent's earnest wish was clearly set forth, and by the terms of which the daughters were made free, and the sum of \$4,000 bequeathed for their support and education, and the noble Dr. Rea was appointed executor of the will.

It was also provided that the whole of the above sum should be expended, if necessary, to secure the freedom of the youngest girl, should an attempt be made to prevent it by the heirs, under the laws of Mississippi, which wise provision, with the energy and firmness of Dr. Rea, proved more than a match for slaveholding cupidity and slaveholding law, as is shown in the fact that both Emeline and Cyrena are now safe in Oberlin, where their wants will be supplied and their education provided for under the direction of Dr. Rea.

But all this has not been accomplished without a severe struggle, every point being warmly contested by greedy heirs with wicked laws on one side, and the determined Doctor and righteousness on the other. For a time it seemed almost certain that the poor cormorants would succeed, and that the money, as well as the liberty of Cyrena, would be lost; indeed, so sure were they of success that the heirs bid Dr. Rea a bold defiance.

At length a point was decided by the Supreme Court of Mississippi in a case involving some important ones in this, and the controversy was brought to a close by a compromise, in which

Dr. R. secured the freedom of the girl and \$3,000 of the money.

A few days ago Dr. Rea might have been seen leaving the plantation of the late James Oldham in a large canoe freighted with his precious charge the tender Cyrena, an unwilling exile from her childhood's home, and making his devious way for nine miles through recently cut gorges, and eddy currents made by the turbid waters of the Mississippi, back to Friar's Point, where he embarked for the purpose of reinstating these sisters in Oberlin, the very place chosen for them by the dying, honest slaveholder, where they can become free, virtuous and intelligent women.

"THE DEW OF THY YOUTH."—PSALM 110: 3.

Inscribed to M. A. G. of Philadelphia.

I've heard it said by some, no longer young and gay,
That for them the gladd'ning loveliness of Life had
pass'd away:

Their pleasures now were few; their affections very
calm;

They only wish'd henceforth for quiet, as a *balm*.
But 'tis not thus with me: tho' many years I've told,
My heart has not begun to feel this growing old.

And yet my brow is furrow'd by lines of grief and
care,
And "silver threads of goodness" are gathering in
my hair;

So much has pass'd before me, so many things I've
seen,

I feel as I were almost some patriarch evergreen;
Yet an autumn and a winter I never can behold,
While the Inner Life blooms freshly, and is not grow-
ing old.

Forth go I on my morning walk, and love sweet
Nature still,

As when I first pick'd buttercups, my tiny hands to
fill;

I love the fields and trees, the birds and garden-
flowers,

Just as I did when they were all fresh things of Life's
fresh hours;

The morning-streaks of crimson, the purple-border'd
West,

Still with their radiant glory can make me richly
blest;

"My heart leaps up to see the rainbow in the sky,"
As when in all its brightness I saw it first on high;
And if the lapse of years must make us hard and cold,
I still am young in life, and never *can* grow old.

For yet it seems but yesterday since, my dear mother
smiled

Upon me, as she fondly said, "God bless my little
child!"

And when from some dear voices I hear a cheering
word

Of gentle, kind approval, I'm like a little bird
Fluttering among the branches with joyful, quivering
wings,

Or treasuring up its *straws*, as precious, sacred things:
'Twas said to me but lately (it was the other day)—
"How like a child you are! at trifles pleas'd and
gay."

Yes! tho' my heart has had more griefs than it could
hold,

It rises from their ashes—and is not growing old.

Cometh there not hereafter a heaven and earth all
new,
No thorns among its flowers, no cloud upon its blue?
No suffering dust to cumber the living spirit's way,
No aching struggle with the ills which cling to it in
clay?
When centuries on centuries their onward course have
told,
Which of the happy dwellers there will fear a growing
old?

Salem, N. J., April 8th, 1859,

A. W. M.

CONSIDER THE LILIES, HOW THEY GROW.

The lilies fair are found
On shadowed ground,
The shady haunts of sunny clime,
And breathe the balm of summer time,
Refreshed by morning dew, and veiled from noontide
glow,
They taste the softest light and air, and this is how
they grow.

Updrawn from verdant sod
By look from God,
These holy, happy flowers pervade
The sloping lawn, the forest glade:
And charm'd by zephyr's wing, and lulled by stream-
let's flow,
They calmly muse, they brightly dream, and this is
how they grow.

They bloom in sheltered nook,
By curling brook;
And earth how firmly, fondly loves,
These treasures of her streams and groves:
The dark mold cherishes their petals white like snow
With heaven apportioned nutriment, and this is how
they grow.

I have considered them,
The flexile stem,
The blossoms pending airy
Beneath their leafy canopy,
Their witching fragrance, spotless hue, and thus I feel
and know
That God imparts their loveliness, and this is how they
grow.

From "A Vacation Voyage to Cuba and Back," by R. H. Dana, Jr.
SLAVERY IN CUBA.

It is difficult to come to a satisfactory conclusion as to the number of slaves in Cuba. The census of 1857 puts it at 375,000; but neither this census nor that of 1853 is to be relied upon, on this point. The Cubans are taxed for their slaves, and the government finds it difficult, as I have said, to get correct returns. No person of intelligence in Cuba, however desirous to put the number at the lowest, has stated it to me at less than 500,000. Many set it at 700,000. I am inclined to think that 600,000 is the nearest to the truth.

The census makes the free blacks, in 1857, 125,000. It is thought to be 200,000 by the best authorities. The whites are about 700,000. The only point in which the census seems to agree with public opinion is in the proportion, Both make the proportion of blacks to be about one free black to three slaves; and make the

whites not quite equal to the entire number of blacks, free and slave together. As to the Coolies, it is impossible to do more than conjecture. In 1853 they were not noticed in the census; and in 1857 hardly noticed. The number imported may, to some extent, be obtained from the records and files of the Aduana, but not so as to be relied upon.

I heard the number estimated at 200,000 by intelligent and well-informed Cubans. Others put it as low as 60,000. Certain it is that Coolies are to be met with everywhere, in town and country.

To ascertain the condition of slaves in Cuba, two things are to be considered: First, the laws; and, secondly, the execution of the laws. The written laws there is no great difficulty in ascertaining. As to their execution, there is room for opinion. At this point one general remark should be made, which I deem to be of considerable importance. The laws relating to slavery do not emanate from the slaveholding mind; nor are they interpreted or executed by the slave holding class. The slave benefits by the division of power and property between the two rival and even hostile races of whites, the Creoles and the Spaniards. Spain is not slaveholding, at home; and so long as the laws are made in Spain, and the civil offices are held by Spaniards only, the slave has at least the advantage of a conflict of interests and principles between the two classes that are concerned in his bondage.

The fact that one negro in every four is free indicates that the laws favor emancipation. They do both favor emancipation and favor the free blacks after emancipation. The stranger visiting Havana will see a regiment of one thousand free black volunteers, parading with the troops of the line and the white volunteers, and keeping guard in the Obra Pia. When it is remembered that the bearing arms and performing military duty as volunteers is esteemed an honor and privilege, and is not allowed to the whites of Creole birth, except to a few who are favored by the government, the significance of this fact may be appreciated. The Cuban slaveholders are more impatient under this favoring of the free blacks than under almost any other act of the government. They see in it an attempt, on the part of the authorities, to secure the sympathy and co-operation of the free blacks in case of a revolutionary movement—to set race against race, and to make the free blacks familiar with military duty while the whites are growing up in ignorance of it. In point of civil privileges, the free blacks are the equals of the whites. In courts of law, as witnesses or parties, no difference is known; and they have the same rights as to the holding of lands and other property. As to their social position, I have not the means of speaking. I should think it quite as good as it is in New England, if not better.

So far as to the position of the blacks, when free. The laws also directly favor emancipation. Every slave has a right to go to a magistrate and have himself valued, and on paying the valuation to receive his free papers. The valuation is made by three assessors, of whom the master nominates one and the magistrate the other two. The slave is not obliged to pay the entire valuation at once, but may pay it in instalments of not less than fifty dollars each. These payments are not made as mere advances of money, on the security of the master's receipt, but are part purchases. Each payment makes the slave an owner of such a portion of himself, *pro parte indivisa*, or, as the Common Law would say, in tenancy-in-common with his master. If the valuation be one thousand dollars, and he pays one hundred dollars, he owns one-tenth by himself and nine-tenths by his master. It has been said, in nearly all the American books on Cuba, that, on paying a share, he becomes entitled to a corresponding share of his time and labor; but, from the best information I can get, I think this is a mistake. The payment affects the proprietary title, but not the usufruct. Until all is paid, the master's dominion over the slave is not reduced as respects either discipline or labor, or right of transfer; but if the slave is sold, or goes by operation of law to heirs or legatees or creditors, they take only the interest not paid for, subject to the right of future payment under the valuation.

There is another provision, which at first sight may not appear very important, but which is, I am inclined to think, the best practical protection the slave has against ill-treatment by his master: that is, the right to a compulsory sale. A slave may, on the same process of valuation, compel his master to transfer him to any person who will pay the money. For this purpose he need establish no cause of complaint. It is enough if he desires to be transferred, and some one is willing to buy him. This operates as a check upon the master, and an inducement to him to remove special causes of dissatisfaction; and it enables the better class of slaveholders in a neighborhood, if cases of ill-usage are known, to relieve the slave without contention or pecuniary loss.

In making the valuation, whether for emancipation or compulsory transfer, the slave is to be estimated at his value as a common laborer, according to his strength, age and health. If he knows an art or trade, however much that may add to his value, only one hundred dollars can be added to the estimate for this trade or art. Thus the skill, industry and character of the slave do not furnish an obstacle to his emancipation or transfer. On the contrary, all that his trade or art adds to his value, above one hundred dollars, is, in fact, a capital for his benefit.

There are other provisions for the relief of the slave, which, although they may make even a better show on paper, are of less practical value.

On complaint and proof of cruel treatment, the law will dissolve the relation between master and slave. No slave can be flogged with more than twenty-five lashes, by the master's authority. If his offence is thought greater than that punishment will suffice for, the public authorities must be called in. A slave mother may buy the freedom of her infant for twenty-five dollars. If slaves have been married by the church, they cannot be separated against their will; and the mother has the right to keep her nursing child. Each slave is entitled to his time on Sundays and all other holidays, beyond two hours allowed for necessary labor, except on sugar estates during the grinding season. Every slave born on the island is to be baptized and instructed in the Catholic faith, and to receive Christian burial. Formerly, there were provisions respecting religious services and instruction on each plantation, according to its size; but I believe these are either repealed or become a dead letter. There are also provisions respecting the food, clothing and treatment of slaves in other respects, and the providing of a sick room and medicines, &c.; and the government has appointed magistrates, styled *Sindicos*, numerous enough, and living in all localities, whose duty it is to attend to the petitions and complaints of slaves, and to the measures relating to their sale, transfer or emancipation.

As to the enforcement of these laws, I have little or no personal knowledge to offer; but some things, I think, I may treat as reasonably sure, from my own observation, and from the concurrent testimony of books, and of persons of all classes with whom I have conversed.

The rule respecting religion is so far observed as this, that infants are baptized, and all receive Christian burial. But there is no enforcement of the obligation to give the slaves religious instruction, or to allow them to attend public religious service. Most of those in the rural districts see no church and no priest, from baptism to burial. If they do receive religious instruction, or have religious services provided for them, it is the free gift of the master.

Marriage by the church is seldom celebrated. As in the Roman church marriage is a sacrament and indissoluble, it entails great inconvenience upon the master, as regards sales or mortgages, and is a restraint on the negroes themselves, to which it is not always easy to reconcile them. Consequently, marriages are usually performed by the master only, and, of course, carry with them no legal rights or duties. Even this imperfect and dissoluble connection has been but little attended to. While the slave trade was allowed, the planters supplied their stock with *bozales* (native Africans) and paid little attention, even on economic principles, to the improvement, or, speaking after the fashion of cattle-farms, to the increase of the stock on the plantation. Now that importation is more difficult, and labor is in

demand, their attention is more turned to their own stock, and they are beginning to learn, in the physiology of increase, that canon which the Everlasting has fixed against promiscuous intercourse.

The laws respecting valuation, the purchase of freedom at once or by instalments, and the compulsory transfer, I know to be inactive operation in the towns, and on plantations affording easy access to towns or magistrates. I heard frequent complaints from slaveholders and those who sympathized with them as to the operation of these provisions. A lady in Havana had a slave who was an excellent cook; and she had been offered \$1,700 for him and refused it. He applied for valuation for the purpose of transfer, and was valued at \$1,000 as a laborer, which, with the \$100 for his trade, made a loss to the owner of \$600; and, as no slave can be subsequently sold for a larger sum than his valuation, this provision gave the slave a capital of \$600. Another instance was of a planter near Matanzas, who had a slave taught as a carpenter; but after learning his trade, the slave got himself transferred to a master in the city, for the opportunity of working out his freedom on holidays and in extra hours. So general is the enforcement of these provisions that it is said to have resulted in a refusal of many masters to teach their slaves any art or trade, and in the hiring of the labor of artisans of all sorts, and the confining of the slaves to mere manual labor. I heard of complaints of the conduct of individuals who were charged with attempting to influence the credulous and too ready slaves to agree to be transferred to them, either to gratify some ill-will against the owner or for some supposed selfish interest. From the frequency of this tone of complaint and anecdote, as well as from positive assertions on good authority, I believe these provisions to have considerable efficacy.

As to the practical advantage the slaves can get from these provisions in remote places, and as to the amount of protection they get anywhere from the special provisions respecting punishment, food, clothing, and treatment generally, almost everything lies in the region of opinion. There is no end to statement and anecdote on each side. If one cannot get a full and lengthened personal experience, not only as the guest of the slaveholder, but as the companion of the local magistrates, of the lower officers on the plantation, of slave-dealers and slave hunters, and of the emancipated slaves, I advise him to shut his ears to mere anecdotes and general statements, and to trust to reasonable deductions from established facts. The established facts are that one race, having all power in its hands, holds an inferior race in slavery; that this bondage exists in cities, in populous neighborhoods, and in remote districts; that the owners are human beings, of tropical races, and the slaves are human beings just em-

erging from barbarism; and that no small part of this power is exercised by a low-lived and low-minded classes of intermediate agents. What is likely to be the effect on all the parties to this system, judging from all we know of human nature?

If persons coming from the North are credulous enough to suppose that they will see chains and stripes and tracks of blood; and if, taking letters to the best class of slaveholders, seeing their way of life, and hearing the dinner-table anecdotes, and the breakfast-table talk of the ladies, they find no outward signs of violence or corruption, they will, probably, also, be credulous enough to suppose they have seen the whole of slavery. They do not know that that large plantation, with its smoking chimneys, about which they hear nothing, and which their host does not visit, has passed to the creditors of the late owner, who is a bankrupt, and is in charge of a manager, who is to get all he can from it in the shortest time, and to sell off the slaves as he can, having no interest, moral or pecuniary, in their future. They do not know that that other plantation, belonging to the young man who spends half his time in Havana, is an abode of licentiousness and cruelty. Neither do they know that the tall hounds chained at the kennel of the house they are visiting are Cuban blood-hounds, trained to track and to seize. They do not know that the barking last night was a pursuit and capture, in which all the white men in the place took part; and that, for the week past, the men of the plantation have been a committee of detective and protective police. They do not know that the ill-looking man who was there yesterday, and whom the ladies did not like, and all treated with ill-disguised aversion, is a professed hunter of slaves. They have never seen or heard of the Sierra del Cristal, the mountain-range at the eastern end of Cuba, inhabited by runaways, where white men hardly dare to go. Nor do they know that those young ladies, when little children, were taken to the city in the time of the insurrection in the Vuelta de Arriba. They have not heard the story of that downcast-looking girl, the now incorrigible malignant negro, and the lying mayoral. In the cities they are amused by the flashy dresses, indolence and good humor of the slaves, and pleased with the respectfulness of their manners, and hear anecdotes of their attachment to their masters, and how they so dote upon slavery that nothing but bad advice can entice them into freedom; and are told, too, of the worse condition of the free blacks. They have not visited the slave jails, or the whipping-posts in the house outside the walls, where low whites do the flogging of the city house servants, men and women, at so many reals a head.

But the reflecting mind soon tires of the anecdotes of injustice, cruelty and licentiousness on the one hand, and of justice, kindness and mu-

tual attachment on the other. You know that all coexist, but in what proportion you can only conjecture. You know what slavery must be, in its effect on both the parties to it. You seek to grapple with the problem itself. And, stating it fairly, it is this: shall the industry of Cuba go on, or shall the island be abandoned to a state of nature? If the former, and if the whites cannot do the hard labor in that climate, and the blacks can, will the seven hundred thousand whites, who own all the land and improvements, surrender them to the blacks and leave the island, or will they remain? If they must be expected to remain, what is to be the relation of the two races? The blacks must do the hard work, or it will not be done. Shall it be the enforced labor of slavery, or shall the experiment of free labor be tried? Will the government try the experiment, and, if so, on what terms and in what manner? If something is not done by the government, slavery will continue, for a successful insurrection of slaves in Cuba is impossible, and manumissions do not gain upon the births and importations.

That minister, whose life is not the model of his doctrine, is a babler rather than a preacher, a quack rather than a physician of value.—*Penn.*

ITEMS OF NEWS.

THE Steamer Hungarian, from Liverpool, brings the intelligence that the Atlantic Telegraph Company, in issuing proposals for subscription to the new stock, pledge themselves to enter into no contract without seeking the advice of the highest scientific and practical authorities of England and America. The first operations are to be to endeavor to raise the old cable.

The Submarine Telegraph Company have successfully laid a new cable, containing six conducting wires, between Folkstone and Boulogne. It is the largest and strongest cable ever made, its weight being ten tons to the mile.

LIBERIA.—We have advices from Liberia to the 16th of 6th mo. The general election took place on the 1st of 6th mo., and resulted in the re-election of President Stephen A. Benson to a third term without opposition. D. B. Warner, of Monrovia, was chosen Vice President. These represent the "whig" party. The "free Liberians" made no nominations, as ex-President Roberts declined being a candidate. The agricultural prospects of the colony were very good. There had been more of the products of colonial labor shipped to the United States and England within the preceding six months than during the previous forty years.

THE NEXT CENSUS.—The late Congress appropriated only \$15,000 as preliminary to the taking of the new census, for the preparation of blank forms, instructions to Marshals, &c. Ample time will be allowed for the selection of reliable deputies, and such arrangement will be made by the Secretary of the Interior as will secure the prosecution of the work with more perfectness than heretofore.

THE AILANTHUS.—We see it stated that the late researches of the French Professor, Hetel, prove that the bark of the Ailanthus contains a volatile oil which is

so deleterious in its effects, that the assistants who had the evaporation of the extract under their care, would be seized with vertigo and vomiting whenever they came in contact with the vapors. The unpleasant smell of this tree is supposed to be owing to the natural evaporation of this pernicious oil. Many persons, particularly invalids, are sickened by the smell of the Ailanthus, especially when it is in flower.

THE FISHERIES.—The St. John (N. B.) papers state that the herring and salmon fisheries in that vicinity, this spring, have been unusually successful. A very large proportion of the salmon caught would weigh 30, 35 and 40 pounds each.

ACCIDENTS ON THE WESTERN RIVERS.—The list of disasters on the Western waters, during the first six months of this year, is heavier than at any former period, viz:—Boats snugged, 22; boats exploded, 4; boats burnt, 26; lost by collision, 13; lost by Rock Island bridge, 1; lost by running against bank, 2; boats foundered, 3; sunk by ice, 2; lost in storm, 1. Total, 74. Flat boats lost, 36. Lives lost, 327. Value of boats and their cargoes, \$1,770,520.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Market is dull. Receipts of Flour continue light, and prices are again lower. Sales of good superfine are reported at \$5 88 for common extra. Good Western extra at \$6 12. The sales to the home trade are limited between \$6 00 and \$7 50 for fancy lots. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 25 and the latter at \$3 75 per barrel.

GRAIN.—Wheat is dull and without demand. Sales of Maryland and Delaware red, new, at \$1 30 a 1 40, and prime white at \$1 45. A lot of fair old Pennsylvania red sold at \$1 25. Rye is selling at 85 c. for new and old. Corn is lower. Few sales of yellow at 88 cts., afloat. Oats are steady. Sales of prime Delaware at 40 cents, and Pennsylvania at 41 cents.

CLOVERSEED comes forward slowly, and prime lots command \$5 50 a 5 87 per 64 lbs. Timothy is worth \$2 50. Flaxseed is scarce at \$1 60 a 1 65.

A well qualified teacher is wanted to take charge of Darby Monthly Meeting School. Application can be made for further information to

RACHEL T. JACKSON or

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SEVENTH MONTH 23, 1859.

No. 19.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made. The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

On the Divine Being.

(Continued from page 275.)

James. I think the circumstance of his being received up into a *cloud*, does not prove that the same body of *flesh and bones* was introduced into the spiritual world. As God is a pure "Spirit, without body, parts, or passions,"* it is very possible that he changed his Son into his own likeness, or that he gave him a spiritual body. When Elijah was translated, he was taken up by a chariot of fire and horses of fire, but I do not conclude from this, that there are horses in heaven. I consider it a striking evidence of Divine power displayed on this occasion, to confirm the faith of Elisha.

Jesus taught the Jews that Abraham, Isaac, and Jacob, were *then* living. Matt. xxii. 32. Yet we have no reason to believe that their *earthly bodies* ever had been raised from the grave. What I understand by the resurrection, as regards a future existence, is the soul being raised out of this state of mutability into a spiritual world, where it shall receive either happiness or misery, "according to the deeds done in the body."

Father. Perhaps we had best not indulge in much speculation on this subject, for "secret things belong unto the Lord our God, but the things which are revealed belong unto us and our children."

The apostle Paul, on the subject of the resurrection, says, "Now this I say, brethren, that flesh and blood cannot inherit the kingdom of God." 1 Cor. xv. 50. And the apostle John

writes with still more caution, for he says, "Beloved, now are we the sons of God, and it doth not *yet appear* what we shall be; but when he cometh we shall be like him, for we shall see him as he is; and every man that hath this hope in him, purifieth himself, even as he is pure." 1 John iii. 2, 3. This ought to be the main object of our thoughts, to purify ourselves even as he is pure, in order that we may become the sons of God. "My little children," saith the apostle, "of whom I travail in birth again until Christ be formed in you," Gal. iv. 19. "There is one body, and one spirit, even as you are called in one hope of your calling; one Lord, one faith, one baptism, one God and Father of all, who is above all, through all, and in you all. But unto every one of us is given grace according to the measure of the gift of Christ." Eph. iv. 4-7. "Till we all come, in the unity of the faith and of the knowledge of the Son of God, unto a perfect man, unto the measure of the stature of the fulness of Christ." ver. 13. This stature of the fulness of Christ consists, I believe, in a state of perfect obedience to the law of Divine love by which means our minds may become so transformed by the spirit of Christ, as to be in unity with him, even as he is in unity with the Father; agreeably to the prayer of the blessed Jesus, when he said, "Holy Father, keep through thine *own name* those whom thou hast given me, that they may be *one* as we are. As thou, Father, art in me, and I in thee, that they may be one in us." John xvii. 11, 21. "I will pray the Father," said he, "and he shall give you another Comforter, that he may abide with you for ever, even the Spirit of truth, whom the world cannot receive because it seeth him not, neither knoweth him: but ye know him, for he dwelleth *with* you, and shall be *in* you. I will not leave you comfortless, I will come to you." John xiv. 16-18.

Here we see that the same Holy Spirit which was in Jesus, and thus dwelt *with* the disciples, was to be manifested *in them*, for their comfort; and not unto them only, but unto as many as should believe on him through their word.

John. If we consider the divine Word, or Spirit of Christ, to be the medium through which God reveals himself to man, does not this seem to imply that there are two Divine powers or persons?

Father. I will answer this question by asking another. What do men generally understand by

* Episcopal Articles.

the term nature, when they speak of the laws of nature and the powers of nature? Do they mean that there is another power besides that of God, operating upon the material world?

John. I understand by it nothing more than the power of God, as continually displayed in the outward creation.

Father. And so, when I speak of Christ or the Divine Word, I mean "the power of God and the wisdom of God," (1 Cor. i. 24,) as manifested in the souls of men, to redeem them from all iniquity, and to bring them into his own glorious image of purity and love. This Divine power is represented under various figures or metaphors, in the scriptures; but the most striking and beautiful is that of light. The apostle John says, "God is light, and in him is no darkness at all." And speaking of Christ he says, "In him was life, and the life was the light of men; that was the true light, which lighteth every man that cometh into the world." God is the great luminary or sun of his spiritual creation; and that power or influence by which he acts upon the souls of men, is called his light: "For whatsoever doth make manifest is light. Wherefore he saith, Awake thou that sleepest, and arise from the dead, and Christ shall give thee light." Eph. v. 13, 14. As the light of the sun is the source of all the beauty that adorns the outward creation, and as the smallest ray of light contains in itself every colour of the rainbow; so this Divine light which emanates from God, is the source of every Christian virtue, and "in it are hidden all the treasures of wisdom and knowledge."

When we see such striking evidences of Divine power and goodness displayed in the government of the outward world,—clothing the earth with flowers and verdure in spring, with harvests in summer, and with fruits in autumn,—and preserving the various tribes of animals through the severity of winter: when we feel assured that not even a sparrow falls to the ground without his notice;—can we suppose that he withdraws his presence from the immortal part of his creature man? No; it is on the rational soul of man that he bestows his peculiar care; it is there that his sensible presence is felt, and to him alone are we indebted for every holy aspiration after virtue, and every feeling of extended benevolence. And he not only incites us to goodness, but he reproveth us for evil, and, as a tender father, he revisits and revisits his erring children with "the reproofs of instruction, which are the way of life."

"Thou art the source and centre of all minds,
Their only point of rest, *Eternal Word!*
From thee departing they are lost, and rove
At random, without honor, hope, or peace.
From thee is all that soothes the life of man;
His high endeavor, and his glad success,
His strength to suffer, and his will to serve.
But O thou bounteous Giver of all good,
Thou art of all thy gifts thyself the crown!

Give what thou canst, without thee we are poor;
And with thee rich, take what thou wilt away."

COWPER.

NOTE.

There is one text which was not introduced nor alluded to in the foregoing conversation, because its authenticity is now considered so doubtful that it has been abandoned by some of the most learned biblical critics. The following remarks in relation to it are extracted from the Commentary of Adam Clarke, a learned trinitarian writer.

1 John v. 7. "For there are three that bear record in heaven, the Father, the Word, and the Holy Ghost; and these three are one."

"There are one hundred and thirteen Greek MSS. extant, containing the first epistle of John, and this text is wanting in one hundred and twelve. It only exists in the Codex Montfortii, (a comparatively recent MS.) already described."

"All the Greek fathers omit the verse, though many of them quote both verses 6th and 8th, applying them to the Trinity, Divinity of Christ, and the Holy Spirit."

"The first place the verse appears in Greek, is in the Greek translation of the council of Lateran, held A. D. 1215."

"The Latin fathers do not quote it, even where it would have greatly strengthened their arguments; and where, had it existed, it might have been most naturally expected. It is wanting in all the ancient versions, the Vulgate excepted; but the most ancient copies of this have it not."

"It is wanting in the German translations of Luther, and in all the editions of it published during his lifetime. It is inserted in our early English translations, but with marks of doubtfulness."

"In short, it stands on no authority, sufficient to authenticate any part of a revelation professing to have come from God."—See *Griesback's Greek Testament*.

SOME EXTRACTS FROM THE WRITINGS OF OUR DECEASED FRIEND, JACOB L. MOTT.

(Concluded from page 279.)

Happiness of Resignation.

The object of christianity is unquestionably to eradicate evil from society; to lay the axe at the root of the tree of error, that it may destroy its fruits, and to change the condition of man from an earthly to a heavenly nature, and thereby elevate him in the scale of spiritual progression, and in the knowledge of the attributes of God. And here we shall experience that "Order is heaven's first law," and also learn that a mere compliance with an outward rule is insufficient to make us Christ-like; for if the outward law given to the Jews, with all its ceremonies, temples, priests, altars, and sacrifices, could not, as Paul declares, make those that did the service

perfect, as pertaining to the conscience, neither was it adequate to take away sin. How can we expect, then, that a mere profession of religion, or an observance of outward ceremonies, can make us perfect, or so far redeem us from sin as to bring us into union with God?

But if we know an inward purification, a sin subdued, a turbulent passion conquered, or a victory obtained over "the lusts of the flesh, the lust of the eye and the pride of life," then indeed have we approached nearer to the Father of spirits, and our worship becomes acceptable to him, and useful to us. Let us "seek first the kingdom of heaven, and fulfil the righteousness thereof," and all things pertaining to our present and future well-being will be added. We shall find in the kingdom of heaven there is perfect order; the whole mind becomes subject to the laws and cross of Christ. The discipline and exercise of mind which is then established leads us to "cease to do evil and learn to do well," and to cultivate the fruits of the spirit, which are love, mercy, charity, meekness, gentleness and peace.

These are among the trees of the garden (so beautifully described in the figurative language of Scripture) which man was commanded "to dress and to keep, of the fruit of which he might freely partake and live."

Let us consult our own experience, and know that the spirit of truth, which is calling us unto the kingdom where truth only reigns, is nothing short of a ray of light emanating from the Infinite Being for the blessed purpose of enlightening our pathway, and instructing our understandings in the way we should go. If we obey its voice our souls shall live. It says unto us with indubitable clearness, the reward of obedience is peace and joy, and the consequence of transgression remorse and anguish of spirit.

Religion, to be useful, must be practical. Our Father in heaven looks at the heart only, and condescends to dwell in minds that are humble and contrite before him. The many creeds and ceremonies which men regard as so essential, are, in his sight, valueless of themselves, (although they are, perhaps, sometimes intended as a school-master, to lead to Christ,) and the soul that feels there is "None in heaven but him, nor in all the earth like unto him," witnesses the truth of the declaration, "Behold the tabernacle of God is with men, and he will dwell with them, and they shall be his people, and God himself shall be with them and be their God."

Oh, this religion will enable us to overcome the sins that most easily beset us, and there can be no greater victory than to overcome the enemies of our own household; it is of infinitely more value than the mightiest triumphs that ever were achieved amidst the confused noise of the warrior, and garments rolled in blood.

"He that is slow to anger is better than the

mighty, and he that ruleth his spirit than he that taketh a city."

What, then, are we to think of those who, with skepticism and infidelity, are contending against the principles of the Christian religion? and because they have found a part of the doctrines and orders professed by some to be wrong, conclude all are false, and having pledged themselves on what they call the altar of free-inquiry, are endeavoring to carry out a vague scheme to remodel social organizations, or annihilate those institutions and laws which are the safeguards of good morals and virtuous society. Need I warn my brothers and sisters against these, whose efforts tend to elevate human wisdom above the gospel of Christ? Oh, that we may keep our minds free from speculations concerning things which lie beyond the comprehension of finite minds, and which give rise to vain disputations tending to retard the progress of truth, wherein God does not receive that glory which is his due.

Hence, we, as a people, have to contend against a doctrine which has not the special revelation of God's will for its foundation—one which teaches that man is governed by the same instinct as other animals, of which he possesses only a higher degree.

Let the justice of our cause, and the evidence of being in the right, and above all, the worship of God inspire our hearts with humility and zeal becoming the advocates of truth.

I have no purpose, save that of bearing my testimony to the truth as it is in Jesus, and raising my feeble voice against error and the perversion of the truths of heaven; the revelation of God being my authority, as Paul said to the Galatians; "For I neither received it of man, neither was I taught it, but by the revelation of Jesus Christ."

When the infidel and bigot shall believe that Christ is the son of God and the Saviour of the world; when the schemes of men shall have ceased, and they rest from their labors, as God did from his, then shall the true Sabbath be enjoyed. "The morning stars shall sing together, and all the sons of God shout for joy."

His testimony against a hireling ministry is as follows:

If we reject the religion which God reveals in the heart, by the teachings of the spirit, we can only obtain that which results from the exercise of mental powers, unenlightened by divine grace. And to assist these, it is necessary men should receive an education, whereby much expense is incurred, in order that they may establish and maintain their different theories, for the purpose of which many schemes are devised to obtain money to aid in propagating them. Therefore it is my testimony that all these things are the work of the foolish prophets, and cannot meet with acceptance with him who is pure and holy for the works of man, though ever so brilliant.

can rise no higher than their fountain; but the teachings of the grace of God will lead to him.

Of the gospel ministry he writes thus:

Although the grace of God is sufficient of itself to teach man, and enable him to fulfil the law which God writes on his heart, it is still consistent with his goodness to raise up and qualify ministers, to stir up the mind by way of remembrance of the promises he has made, and to inculcate the precepts of Christ. To entreat his rational creatures to become reconciled unto God, and to do his will in all things. These are ambassadors of Christ. Oh, then, how necessary it is for them to keep close to the matter and design of the ministry, as did their holy example; he being sent of God, said, "My doctrine is not mine, but his that sent me;" and the apostle also said, "I have received of the Lord that which I delivered unto you." Oh, that ministers would keep on the watch. "Son of man, I have made thee a watchman unto the house of Israel, therefore hear the words at my mouth, and give the warning from me."

It is the Lord's work, and not man's, and God's wisdom is marvellously displayed in the circumstance of calling those who were weak, poor, and lowly in the estimation of the world, and who felt themselves to be unworthy so great a cause, that both they and others might see and know that the excellency of power is of him and not man, and that flesh might not glory in his presence.

Christ, in giving instruction to his ministers, charged them (that even when they should be arraigned before kings and governors for the testimonies they bore) to "take no thought, beforehand, what ye shall speak, neither do ye premeditate, but whatsoever shall be given you in that hour, that speak, ye, for it is not ye that speak, but the Holy Ghost."

This living ministry, wholly from divine inspiration, was evidently introduced and established as the ministry of Jesus Christ; and we cannot believe that that which was begun in the spirit was ever designed to be afterwards continued by the natural or acquired abilities of man; for the object is the same through all ages, to open the eyes of mankind, and to turn them from the power of Satan to God and to edify the church; and no man, by his natural powers alone, was ever able, or ever will be, to do this. The Apostle Paul says, "Not that we are sufficient of ourselves to think anything as of ourselves, but our sufficiency is of God, who also hath made us able ministers of the New Testament, not of the letter, but of the spirit; for the letter killeth, but the spirit giveth life."

Thus the gospel ministry, which was instituted under the highest authority in the beginning, must ever continue the same. We may look in vain in the scriptures of truth for the divine sanction of the ministry entered into by

the will of man, and without immediate and divine revelation. Hence we may boldly assert that nothing can deserve the name of gospel ministry which has not God for its author, and his immediate influence for its director.

(To be continued.)

PARENTAL SYMPATHY.

Parents express too little sympathy for their children; the effect of this is lamentable.

"How your children love you! I would give the world to have my children so devoted to me!" said a mother to one who did not regard the time to her children as so much capital wasted. Parents err fatally when they grudge the time necessary for their children's amusement and instruction; for no investment brings so sure and so rich returns.

The child's love is holy; and if the parent does not fix that love on himself, he deserves to lose it, and, in after-life, to bewail his poverty of heart.

The child's heart is full of love; and it must gush out toward somebody or something. If the parent is worthy of it, and possesses it, he is blest; and the child is safe. When the child loves worthy persons, and receives their sympathy, he is less liable to be influenced by the undeserving; for in his soul are models of excellence, with which he compares others.

Any parent can descend from his chilling dignity and freely answer the child's questions, talking familiarly and tenderly with him; and when the little one wishes help, the parent should come out of his abstraction and cheerfully help him. Then his mind will return to his speculations elastic, and it will act with force. All parents can find a few minutes, occasionally, during the day, to read little stories to the children, and to illustrate the respective tendencies of good and bad feelings. They can talk to them about flowers, birds, trees, about angels, and about God.

They can show interest in their sports, determining the character of them. What is a surer way than this of binding the child to the heart of the parent? When you have made a friend of a child, you may congratulate yourself you have a friend for life.—[*Life Illustrated*.]

The time and labor are worse than useless that have been occupied in lying up treasures of false knowledge which it will be necessary to unlearn, and in storing up mistaken ideas which we must hereafter remember to forget. An ancient teacher of rhetoric always demanded a double fee from those pupils who had been instructed by others, for in that case he had not only to plant, but to root out.

From the Edinburgh Review.

FEMALE INDUSTRY.

(Continued from page 283.)

Before we leave the margin of the sea, we must just glance at the smaller occupations pursued there by women. The most considerable of these was once the gathering and burning of kelp; but chemical science has nearly put an end to that. There is still a great deal of raking and collecting going on. In some counties, half the fields are manured with small fish, and the offal of larger, and seaweeds and sand. Then there is the gathering of jet and amber, and various pebbles, and the polishing and working them. The present rage for studies of marine creatures must afford employment to many women who have the shrewdness to avail themselves of it. Then there are the netting women, who supply that part of the fisherman's gear; and the bathing women, where visitors congregate. We have no means of learning the numbers engaged in such a variety of seaside occupations, but they must be considerable.

As nearly two-thirds of our maid-servants are country-born, that class presents itself next for review. There are some standing marvels in regard to the order; how it is that so few of them marry, and how they live in old age; both questions being pertinent to every inquiry into female industry.

The small proportion of marriages among domestic servants is no marvel, if we consider that nearly half a million of our maid servants have come from country places, where the proportion of the sexes was about equal, to towns where their numbers are added to the women's side, while a considerable percentage of the men are absent as soldiers, sailors, fishermen, commercial agents, &c. We find the following passage in 'The Industrial and Social Position of Women':—

'Take for illustration the town of Edinburgh. In 1851 there were in that town (including Leith):

Men above the age of 20	- -	47,049
Women	" "	64,638

the proportion being as three to four. In the same town the number of the sexes below the age of 20 was about equal. Turn then to the number of domestic servants. Of these there were no less than 12,449 above the age of 20, besides nearly half that number below the age of 20. In other words, 1 out of every 5 women in Edinburgh above the age of 20 is a domestic servant, while in Great Britain on the average, 1 in 10 only is so. Even this large number of domestic servants does not suffice to account for the large disproportion of the female sex in the town in question. It is partly attributable to the seaport of Leith; and the even distribution of wealth in such a town as Edinburgh, besides drawing from rural districts an unusually large

proportion of domestic servants, draws also many women from the same districts to the trade of millinery, and to other assignable and unassignable occupations. But, that the main cause of the disproportion of the sexes in Edinburgh is referable to domestic service, may be seen by comparing the statistics of that town with those of its rival Glasgow. Glasgow is in many respects a wealthier town than Edinburgh, but not in the same sense. In Edinburgh a large section of the population stand above the working ranks, and wealth is distributed. In Glasgow riches tend to accumulate in the hands of a smaller number of individuals; wealth is not distributed; a larger section of the population fall within the working ranks, and fewer persons can afford to have domestic servants. Hence, although Glasgow is one of the most extensive shipping ports, with many of its population absent at sea (an agency, however, that is probably counterbalanced by the influx of adventurers,) the sexes in that town counted, in 1851, as follows:—

Men above the age of 20	- -	83,455
Women	" "	100,574

the proportion being as six to seven, or thereby, in place of three to four, as in Edinburgh. In Glasgow, the number of female domestic servants above the age of 20 is 9635; less than one in ten of the female population of the same age, less than the average of Great Britain, and about one-half the proportion obtaining in Edinburgh.' (Pp. 194-6.)

This explains a great deal of the celibacy of the class. In houses where men-servants are kept, the house-maids and cooks marry; and so they do in country mansions, where they are considered good matches by the young laborers round; but in middle-class households, in towns, it is rather a remarkable circumstance when a servant marries from her place. This tends to establish the independence of female industry. The class is so large, and their earnings are so completely at their own disposal, that their industrial position is as determinate as that of men. The household, of which they form so useful and essential a part, becomes their home. Born for the most part in a cottage, and destined, if they marry, to struggle through married life in narrow circumstances and bitter privations, it is only in the houses of the middle and higher classes that they participate in those comforts and even luxuries of domestic life which capital, as well as labor, affords. There are few changes in the life of a woman more severe than that by which she transfers herself from the security and ease of domestic service to the precarious independence of married life; accordingly, this check operates with great power on the propensity to marriage among female domestic servants, and, as we have seen, a very large proportion of them do not marry at all. As for the other question,

how they are supported when past work, there may be several answers, none of which are very cheering. Our readers must be aware that this is one of the points on which we have found it necessary to consult the female members of the family council. They, and the clergyman, and the physician, can, among them, afford some degree of satisfaction, though of a dismal quality. The physician says that, on the female side of lunatic asylums, the largest class, but one, of the insane are maids of all work (the other being governesses.) The causes are obvious enough; want of sufficient sleep from late and early hours, unremitting fatigue and hurry, and, even more than these, anxiety about the future from the smallness of the wages. The 'general servant,' as the maid of all work is now genteelly called, is notoriously unfit for higher situations, from her inability to do anything well. She has to do everything 'somehow,' and therefore cannot be expected to excel in anything. At the same time, her wages are low, because it is understood that a servant of high qualification in any department would not be a maid of all work. Thus she has no prospect but of toiling on till she drops, having from that moment no other prospect than the workhouse. With this thought chafing at her heart, and her brain confused by her rising at five, after going to bed at an hour or two past midnight, she may easily pass into the asylum some years before she need otherwise have entered the workhouse. 'This is horrible!' some of our readers will exclaim, 'but it relates to only a small proportion of one out of many classes of maid-servants,—a very small class, probably.' Not so. Little as the fact is generally understood, the maids of all work constitute nearly half of the entire number of female domestics, as computed at the last census, including the large class of charwomen, who amount to nearly 54,000. We are apt to forget that all the households in the land have not each a cook, and housemaid at least, and a nursemaid where there are children; but if we would consider the vast tradesman class, and the small manufacturers, and the superior artizans, we should not be surprised to find that in Great Britain (without Ireland) there are upwards of 400,000 maids of all work. Beginning upon five or six pounds wages in youth, they rarely rise beyond ten pounds. They have no time to take care of their clothes, which undergo successive wear and tear, so that it is a wonder if there is anything left for the Savings' Bank at the year's end. Such is the aspect of one branch of independent industry in England.

How is it with the other classes of the sisterhood? What are their chances of escaping the workhouse?

The next in number to the 'general servants,' and rather more than one-eighth as many, are the charwomen, as we have just seen. In full

practice, a charwoman makes from twenty to twenty-five pounds a year (at one shilling and sixpence a day, Sundays excepted,) apart from her food. As 'advantages of various kinds occur to occasional servants, she may obtain enough in that direction to provide her room and bed, and thus she can, if alone in the world, and at the head of her kind of service, lay by ten pounds a year; but the chances are much against it, and all the wives and widows, with children at home, must find it as much as they can do to live. Next in number, to our surprise, we find the housekeepers, who are scarcely short of 50,000. The wages of a housekeeper, in the proper sense of the term, are, we are assured, not less than forty or fifty pounds, provided she has nothing to do with cooking; but a 'cook and housekeeper' is a domestic officer of a lower grade. If, then, housekeepers wear out naturally, and are not heavily burdened, they may easily afford to purchase a small annuity (and, if a deferred annuity, a not very small one) from their savings. The cooks come next and in no class are the wages so various. A middle-class household, in which two servants are kept, pays the cook ten pounds, and from that point the wages rise (we are informed) to about forty pounds, when the man cook assumes the command of the kitchen fire. Of the 47,000 women cooks in our kitchens, the larger proportion receive from twelve to eighteen pounds a year. The housemaids are fewer than the cooks, their number being under 42,000. Their work is easier and lighter than that of any other class in domestic service, and it is somewhat less highly paid. We are told that they, for the most part, have twelve pounds, almost as many having ten pounds, and few rising above fourteen pounds. Among the nursemaids the lady's-maids must be included, unless they come in with the housemaids in the tables before us, which seems improbable. The nursemaids are set down as amounting to 21,000. It is a surprise to fond papas, who think that their children are not made of the same clay as other people's, that their personal attendant, the guardian of such treasures, should be paid no higher than the woman who sweeps the chambers and polishes the grates; but the truth is, the best nursemaids are young girls, properly looked after by the mamma. So think the children, and they are good judges. The nursery girl begins with her five or six pounds, and if, in course of years, she becomes the elderly head nurse in a dignified place, her wages rise to perhaps four times the amount. Indeed, we have recently heard of a case in which the head nurse, guardian, no doubt, of babies of price, receives in wages no less than forty pounds; but we trust, for the sake of the nurseries of England, that the case is a rare one, and that our indiscreet disclosure of the fact will not be followed by a general strike in that department. To make up the half million, there

are the gate-keepers in country mansions (between three and four hundred,) and the 20,000 inn-servants, whose receipts are not, for the most part, in the form of regular wages.

Now, how can half a million of women, accustomed to the comforts of our households, provide for the time when they must go and seek a home for themselves? Most of them belong to poor families whom they must assist; but if not, what can they save in the way of a provision? Two or three pounds a year is as much as the larger proportion can possibly spare. Where the choice is offered them of a money payment, to provide themselves with tea and beer (about two guineas a year for each,) the two or three pounds may be made four or five; and this, we are assured, often happens. Still, with every advantage of good health and quality, and consequent continuous service, and with all aids of economy, it is apparently impossible for domestic servants to secure for their latter days anything like the comforts they have been accustomed to from their youth upwards. The clergymen can tell how shockingly thankful they often are, in the cold and bitter season which closes their lives, for the bounty which passes through his hands. Our wives say they encounter old servants in every almshouse they visit. Too often we find that the most imbecile old nurses, the most infirm old charwomen, are the wrecks and ruins of the rosy cooks and tidy housemaids of the last generation. This ought not to be. We are not alone in the wonder we have felt all our lives at the exceedingly low rate at which we obtain such a benefit as having the business of living done for us. There must be a change. When society becomes aware of the amount of industrial achievement performed by women, the chief impediment to an equalization of wages for equal work will be removed, and domestic servants will then require higher wages, or leave service. In fact, this change has already begun. Wages are rising to unprecedented sums, is the cry we hear from the domestic exchequer; they have probably increased in the last twenty-five years more rapidly than the price of any other branch of female emoluments; they are increasing more rapidly in towns than in the country, and most rapidly in London. Unhappily the taste for expensive dress increases in the same ratio, and a very large portion of these legitimate earnings is squandered to procure a smart bonnet, a silk dress, a mantilla, and a parasol for Sundays. It is certainly a moral duty of no slight obligation on masters and employers to endeavor to assist the members of their household to make a judicious use of their earnings. It is not difficult for them to do justice, without running the risk of putting too much money into unprepared hands. There are Savings' Banks and many kinds of Assurance societies where distant annuities may be secured on various terms.

Under the head of 'service' several kinds of independent industry occur which need only be pointed out: as sick and monthly nurses, matrons and nurses in asylums and hospitals; women who go out to brew, to cook, to wash, and to sew; the searchers at police and custom-house offices; matrons of gaols; light-house keepers; pew-openers; waiters at railway refreshment rooms, and the like. These lead us, by a natural transition, to the commercial direction of female industry, some of which partake of the character of service.

In looking over the census returns, the occupations mark out the classes of women employed, the widows, wives, and maidens. The shopkeepers, like the farmers, are almost always the widows, who, as wives, assisted their husbands, and who now endeavor to keep up the business for the sake of the children. The same is the case with the 10,000 beershop keepers and victuallers, and the 9000 inn-keepers, and the 14,000 butchers and milk merchants, and the 8000 wagon or hack-carriage proprietors. Considerable as these numbers are, they would range higher if women were taught book-keeping in a proper style. So many are seen to decline in fortune, or to marry again, or in other ways to hand over the business to men, while in France, and in the United States, the same class prosper at least as well as men, that inquiry is provoked into the cause of the English failure; and it is usually found that the weakness lies in the financial ignorance of the women. The weak point is in the multiplication table;—in plain old English, they are bad at ciphering. This leads us to consider the wives. The 'Shoemakers' wives' alone are nearly 94,000, their business being both shopkeeping and manufacturing. They serve ladies and children, and sell across the counter, and in the intervals do the lighter part of the shoemaking. Some other denominations are returned separately, as the 27,000 victuallers' wives, and the 26,000 butcheresses; but it is enough to say here that the industrial wives, specially so returned, amounted in 1851 to nearly half a million. It would be a prodigious benefit to their households if they were qualified to manage the accounts. That there is no good reason why they are not is proved by the recent rise of a class of female accountants in London, as well as by the instances in many of our large towns of the counting-house desk behind the shop, or in the manufactory, being occupied by women. We have never heard a doubt suggested as to the capacity of women for arithmetic; on the contrary, the girls in the Irish National Schools equal or excel the boys in mental arithmetic; and in every good-girls' school of the middle-class there are some children who had rather cover their slates with sums for play than go for a walk. Elderly people remember too, the old-fashioned sight, in unregenerate shops, of

the wife or daughter, well-shawled, and in gloves with the finger-ends cut off, sitting from breakfast time till dinner, and from dinner till dusk, with the great books before her, and the pen always in hand; the light of a candle being observed till late on Saturday evenings, when the accounts of the week were posted up. During the first period of the new style of shopkeeping, the desk class of women seemed to disappear; but they are evidently coming back again. And this fact leads us on to the employment of the single women.

'In taking a ticket the other day at the Edinburgh station of the Edinburgh, Perth, and Dundee Railway, we were pleasantly surprised on being waited on by a blooming and bonnie lassie, who, along with an activity quite equal to, exhibited a politeness very rare in, railway clerks of the literally ruder sex. We observed that the department was entirely occupied by women, there being another giving out tickets, and a third telegraphing. This innovation thus far north is rather startling; but, instead of objecting to it, we think it highly commendable, and hope to see the employment of women in light occupations rapidly extended.'—(*Scottish Press*, December, 1858)

The mention of telegraphing in this passage reminds us of another example. The 'Times' gives the following account of the way in which it was enabled to supply London breakfast-tables with the speeches of Mr. Bright and others, on occasion of the Gibson and Bright festival at Manchester last December.

'It is only an act of justice to the Electric and International Telegraph Company, to mention the celerity and accuracy with which our report of the proceedings at Manchester on Friday night was transmitted to the "Times" office. The first portion of the report was received at the telegraph office at Manchester at 10.55 on Friday night, and the last at 1.25 on Saturday morning. It may be added that the whole report, occupying nearly six columns, was in type at a quarter to 3 o'clock on Saturday morning, every word having been transmitted through the wire a distance of nearly 200 miles. Some of our readers may be surprised to hear that this report was transmitted *entirely by young girls*. An average speed of twenty-nine words per minute was obtained, principally on the printing instruments. The highest speed on the needles was thirty-nine words per minute. Four printing instruments and one needle were engaged, with one receiving clerk each, and two writers taking alternate sheets. Although young girls in general do not understand much of politics, there was hardly an error in the whole report.'

(To be continued.)

REMORSE.—He that will not flee from the occasions and allurements of sin, though they may

seem ever so pleasant to the eye, or sweet to the taste, shall find them in the end to be more sharp than vinegar, more bitter than wormwood, more deadly than poison.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SEVENTH MONTH 23, 1859.

DIED, at the residence of her son-in-law, near Richmond, Indiana, on the 26th of 6th mo. 1859, ANN HUNT, formerly of New Jersey, in the 75th year of her age, after a long and severe illness which she bore with Christian patience, evincing that her day's work was done in the day time, frequently having been heard to say she was waiting the Lord's time.

—, in Brooklyn, on Second-day, 7th mo. 11th, 1859, at the residence of her son S. C. Pearsall, ELIZABETH, widow of the late Thomas Pearsall, in the 92d year of her age, and for many years a member of Westbury Monthly Meeting. The funeral which took place at Matinecock, L. I., was attended by a large concourse of relatives and friends, and testimonies born by Rachel Hicks and Samuel C. Thorne. Her remains were interred in Friends' burying ground at the above place.

VOICES OF THE NIGHT.

(Continued from page 278.)

3. I come next to the lesson which is derived from the fact and the necessity of sleep. Did you never inquire for its moral significance,—this giving yourself up once in twenty-four hours to the seeming arms of annihilation? I do not know how the permanent lesson of man's dependence upon a Power above him could have been so well established as in this ever-returning fact, this ever-renewed necessity. The strongest and most self-confident become, after a few hours' exertion, as weak and as helpless as a little child. Every time we resign ourselves to sleep, we do tacitly perform an act of self-surrender into the arms of Providence. Body and soul, with all their faculties, are given back entirely into keeping of the God who gave them. The outward act has a correspondent influence upon the inward mind, and a religious sense of dependence is thus kept alive in us to an extent we hardly perceive ourselves. It is not suffered to become quite extinct even in the most thoughtless. How boastful would a man become, and how forgetful of the source of his strength, if his strength were never suspended or taken from him! He would soon claim the attribute of self-existence. But now the strong man finds that his sinewy frame relaxes, and the brain sinks away into unconsciousness, and the twin brother of death holds him in its firm embrace. How helpless as an infant! How completely at the mercy of circumstance or accident! A child's stroke might change his breathing into the gasp of dissolution. That reason of which he boasts now flees from him, and

unless restored to him he would wake up an idiot or a maniac.

It is a fact well known to the anatomist, that every man has two brains, or two departments of brain; that from one of these issue those nerves that command all his voluntary motions, while from the other issue the nerves that command involuntary motions, or those functions of his frame over which his will has no direct control. Some organs, the lungs more especially, are supplied with both sets of nerves, and their motion, therefore, is both voluntary and involuntary. They can move with his care, or they can move without it. But the inmost and vital organs are supplied exclusively with the involuntary nerves. Your heart beats just the same without your superintendence. Your lungs will play as you bid them, and stop playing if you say so; but in their healthful action they will play quite as well without your interference. So then our external and internal man are imaged and represented in our very frames. The most internal part of us is played and moved upon by a hand we do not see. Our interior brain takes its impressions directly from a spirit hand; from that Power that ever works in our most secret nature; from that Will which always acts within our will, a Life within our life, seeking its realizations in all we do.

It is known that during sleep only one set of these powers is suspended, while the other set is in full motion and play. The brain that you use gets tired and becomes inactive; the brain in you that God uses never gets tired and never ceases from its work. There is another that does your breathing for you, and keeps the valves of your heart in their regular beat. The outward part of you sleeps; the inward part that opens into the world of mystery is wide awake as ever. This holds of the mind as well as the body. You can control your thoughts and reasonings and fancies while your voluntary brain is awake; but when that sleeps, this other brain takes the control of them, and thought, reason, and fancy are no longer yours. Another power comes into the treasure-house of your memory, and takes the imagery there stored up and unrolls it in a new order, possibly touching it with new and more spiritual hues. It hence results, that when the voluntary powers are entirely quiescent we sometimes get better impressions than we did when those powers were in complete operation, for then we did not meddle with the Power that works within us. Falling in with these laws of our nature, we read that in primitive times God chose to make his highest communications to his children while they slept, so that the patriarch came out of his sleep as out of the very entrance-gate of heaven. Hence, too, the reason why sleep revives our drooping faculties. There is nothing in rest, considered as mere inertia, that can impart any strength to us. It is because then a higher Pow-

er works within our voluntary faculties, and works without hindrance, and so pours new life and soundness through them all. Somehow we wake up with an elasticity of thought, a strength of purpose, a clearness of soul, which we never could have given ourselves by mere inertia, or by any contrivance known to human ingenuity. Truths we had toiled for in vain the night before, now stand out on the canvas of the mind as in letters of gold. The mathematician who gave over his problem in the evening, sometimes finds on waking that it has almost solved itself. But the heart, as we have seen the most internal part of all, is then in the special keeping of God. Hence our feelings, which had been desponding the evening before, are now fresh and fragrant as the morning. The high purposes from which we swerved the day before, now seem clearly practicable; then there were lions in the way, and we were ready to give over; now we can meet them with brave hearts, and slay them as we go. Even wrath and boding revenge, except in the worst men, will not bear to be slept upon. They are swept by some hand invisible from the precincts of the heart and the brain, and lo! we awake in a new atmosphere, which somehow has been breathed around us. Who has been with us? What ministries of light and love have poured into us that unconscious life which has cost us no sacrifice and effort? There are divine influences that come to us as the brightest visits of our waking hours; but this unfailling provision by which Heaven steals upon us unawares, shedding new brightness over all within us, and sometimes retouching with a pencil of light truths which were fading into dimness, should also command our unfailling admiration and gratitude. They belong to those blessed ministrations of the night which wait on all the children of men, and which make its hours something more than blanks in human existence. We resigned our bodies, and they are returned to us restrung and renewed; we resigned our reason, and it returns to us relumed and strengthened: our whole nature is returned to us wearing the freshness of a world unseen.

But let us now gather up the important lesson which comes to us from this branch of our subject. I suppose there are few persons who, when they lie down upon their pillows, make a perfect and devout resignation to God of all their voluntary powers, and therefore they fail of that refreshment and renovation of soul which are the highest end of slumber. Few, comparatively, have the faculty of sleeping well. The last voluntary thoughts too often are thoughts of worldly scheming; there is no giving up unto God, no sweet surrender of our burden of care. The last images that float in our memories are those that throng from the scene of labor, perhaps from scenes of guilty indulgence. The consequence is, that the involuntary brain, or the Power that works through it,

does not work in us without hinderance, or it finds in our memories only such images as the poet saw within the jaws of Hades, where

“Revengeful Cares and sullen Sorrows dwell.”

And with these it plays fantastic tricks, and scares us with unreal terrors, and we wake up with feelings as if we had been communing with demons. We do not give up to the divine and renovating powers the whole province of our being. Our last thoughts are not on God, and we do not surrender our will perfectly to the Sovereign Calmer. When this is so, we fail of those holy ministrations of the night, which seek the constant renewal of our whole being. Sleep in its highest sense is so divine a gift, that, as the Psalmist says, God reserves it for his beloved. If at the close of every day's labor, when we lie down to rest, our last thoughts were heavenward, our last mental exercise tranquillizing prayer, and our sleep were spiritually what it must needs be physically, a perfect surrender of our will, an entire giving up to God of all our voluntary powers, the hours of unconsciousness would do quite as much for our spiritual renovation as our physical. A sweet elixir would distil upon the spirit, and we should wake up as from under the gentlest influences of God,—like the pilgrim in Banyan, “whom they laid in a large upper chamber that opened towards the sun-rising. The name of the chamber was Peace, where he slept till break of day, and then he awoke and sang.”

The following speech of Charles H. Langston, a colored man, teacher in Columbus, Ohio, recommends itself to the attentive perusal of every lover of philanthropy. J. W. M.

[On the 12th ult., Mr. Charles H. Langston, teacher in Columbus—on trial at Cleveland for a violation of the Fugitive Slave Law, among the Oberlin-Wellington rescuers—on being asked by the Judge if he had anything to say why the sentence of the law should not be pronounced against him, replied :]

I am for the first time in my life before a court of justice, charged with the violation of law, and am now about to be sentenced. But before receiving that sentence I propose to say one or two words in regard to the mitigation of that sentence if it may be so construed. I cannot of course, and do not expect, that what I may say will in any way change your predetermined line of action. I ask no such favor at your hands.

I know that the courts of this country, that the laws of this country, that the governmental machinery of this country, are so constituted as to oppress and outrage colored men, men of my complexion. I cannot then, of course, expect, judging from the past history of the country, any mercy from the laws, from the constitution, or from the courts of the country.

Some days prior to the 13th of September, 1858, happening to be in Oberlin on a visit, I

found the country round about there, and the village itself, filled with alarming rumors as to the fact that slave-catchers, kidnappers, negro-stealers, were lying hidden and skulking about, waiting some opportunity to get their bloody hands on some helpless creature to drag him back—or for the first time, into helpless and life-long bondage. These reports becoming current all over that neighborhood, old men and women and innocent children became exceedingly alarmed for their safety. It was not uncommon to hear mothers say that they dare not send their children to school, for fear they would be caught up and carried off by the way. Some of these people had become free by long and patient toil at night, after working the long, long day for cruel masters, and thus at length getting money enough to buy their liberty. Others had become free by means of the good will of their masters. And there were others who had become free—to their everlasting honor I say it—by the intensest exercise of their own God-given powers—by escaping from the plantations of their masters, eluding the blood-thirsty patrols and sentinels, so thickly scattered all along their path, outrunning blood hounds and horses, swimming rivers and fording swamps, and reaching at last, through incredible difficulties, what they in their delusion supposed to be free soil. These three classes were in Oberlin, trembling alike for their safety, because they well knew their fate should those men-hunters get their hands on them.

In the midst of such excitement, the 13th day of September was ushered in—a day ever to be remembered in the history of that place, and I presume no less in the history of this Court—on which those men, by lying devices, decoyed into a place where they could get their hands on him—I will not say a slave, for I do not know that—but a *man*, a *brother*, who had a right to his liberty under the laws of God, under the laws of Nature, and under the Declaration of American Independence.

In the midst of all this excitement, the news came to us like a flash of lightning that an actual seizure under and by means of fraudulent pretences had been made.

Being identified with that man by color, by race, by manhood, by sympathies, such as God has implanted in us all, I felt it my duty to go and do what I could towards liberating him. I had been taught by my revolutionary father—and I say this with due respect to him—and by his honored associates, that the fundamental doctrine of this government was that *all* men have a right to life and liberty, and coming from the Old Dominion I brought into Ohio these sentiments, deeply impressed upon my heart. I went to Wellington, and hearing from the parties themselves by what authority the boy was held in custody, I conceived, from what little knowledge I had of law, that they had no right

to hold him. And as your Honor has repeatedly laid down the law in this Court, a man is free until he is proven to be legally restrained of his liberty, I believed that upon that principle of law those men were bound to take their prisoner before the very first magistrate they found, and there establish the facts set forth in their warrant, and that until they did this, every man should presume that their claim was unfounded, and institute such proceedings for the purpose of securing an investigation as they might find warranted by the laws of the State. Now, sir, if that is not the plain, common sense and correct view of the law, then I have been misled both by your Honor and by the prevalently received opinion.

It is said that they had a warrant. Why then should they not establish its validity before the proper officers? And I stand here to-day, sir, to say that, with an exception of which I shall soon speak, *to procure such a lawful investigation of the authority under which they claimed to act, was the part I took in that day's proceedings and the only part.* I supposed it to be my duty as a citizen of Ohio—excuse me for saying that, sir—as an outlaw of the United States, (much sensation,) to do what I could to secure at least this form of justice to my brother whose liberty was in peril. *Whatever more than that has been sworn to on this trial, as act of mine, is false, ridiculously false.* When I found these men refusing to go, according to the law, as I apprehended it, and subject their claim to an habeas inspection, and that nothing short of a *habeas corpus* would oblige such an inspection, I was willing to go even thus far, supposing in that county a Sheriff might, perhaps, be found with nerve enough to serve it. In this I again failed. Nothing then was left to me, nothing to the boy in custody, but the confirmation of my first belief that the pretended authority was worthless, and the employment of those means of liberation which belong to us. With regard to the part I took in the forcible rescue which followed, I have nothing to say, further than I have already said.

The evidence is before you. It is alleged that I said “we will have him any how.” *This I NEVER said.* I did say to Mr. Lowe, what I honestly believed to be the truth, that the crowd were very much excited, many of them averse to longer delay and bent upon a rescue at all hazards; and that he, being an old acquaintance and friend of mine, I was anxious to extricate him from the dangerous position he occupied, and therefore advised that he urge Jennings to give the boy up. Further than this I did not say, either to him or any one else.

The law under which I am arraigned is an unjust one, one made to crush the colored man, and one that outrages every feeling of humanity, as well as every rule of right. I have nothing to do with its constitutionality; about that I care

but little. I have often heard it said by learned and good men that it was unconstitutional. I remember the excitement that prevailed throughout all the free States when it was passed; and I remember how often it has been said by individuals, conventions, communities and legislatures, that it never could be, never should be, and was never meant to be enforced. I had always believed, until the contrary appeared in the actual institution of proceedings, that the provisions of this odious statute would never be enforced within the bounds of this State.

But I have another reason to offer why I should not be sentenced, and one that I think pertinent to the case. I have not had a trial before a jury of my peers. The common law of England—and you will excuse me for referring to that since I am but a private citizen—was that every man should be tried before a jury of men occupying the same position in the social scale with himself. That lords should be tried before a jury of lords; that peers of the realm should be tried before peers of the realm; vassals before vassals, and *aliens before aliens*, and they must not come from the district where the crime was committed, lest the prejudices of either personal friends or foes should affect the accused. The Constitution of the United States guarantees—not merely to its citizens, but to *all persons*—a trial before an *impartial* jury. I have had no such trial.

The colored man is oppressed by certain universal and deeply fixed *prejudices*. Those jurors are well known to have shared largely in these prejudices, and I therefore consider that they were neither impartial, nor were they a jury of my peers. And the prejudices which white people have against colored men grow out of the facts, that we have as a people *consented* for two hundred years to be *slaves* of the whites. We have been scourged, crushed and cruelly oppressed, and have submitted to it all tamely, meekly, peaceably; I mean as a people, and with rare individual exceptions—and to-day you see us thus meekly submitting to the penalties of an infamous law. Now the Americans have this feeling, and it is an honorable one, that they respect those who will rebel at oppression, but despise those who tamely submit to outrage and wrong; and while our people as a people submit, they will as a people be despised. Why, they will hardly meet on terms of equality with us in a whiskey shop, in a car, at a table, or even at the altar of God,—so thorough and hearty a contempt have they for those who will meekly *lie still* under the heel of the oppressor. The jury came into the box with that feeling. They knew they had that feeling, and so the Court knows now, and knew then. The gentleman who prosecuted me, the Court itself, and even the counsel who defended me, have that feeling.

I was tried by a jury who were prejudiced;

before a Court that was prejudiced; prosecuted by an officer who was prejudiced, and defended, though ably, by counsel that were prejudiced. And therefore it is, your Honor, that I urge by all that is good and great in manhood, that I should not be subjected to the pains and penalties of this oppressive law, when I have *not* been tried, either by a jury of my peers, or by a jury that were impartial.

One more word, sir, and I have done. I went to Wellington, knowing that colored men have no rights in the United States which white men are bound to respect; that the Courts had so decided; that Congress had so enacted; that the people had so decreed.

There is not a spot in this wide country, not even by the altars of God, nor in the shadow of the shafts that tell the imperishable fame and glory of the heroes of the Revolution, no, nor in the old Philadelphia Hall, where any colored man may dare to ask a mercy of a white man. Let me stand in that Hall and tell a United States Marshal that my father was a Revolutionary soldier; that he served under Lafayette, and fought through the whole war, and fought for my freedom as much as for his own; and he would sneer at me, and clutch me with his bloody fingers, and say he has a *right* to make me a slave! And when I appeal to Congress, they say he has a right to make me a slave; when I appeal to the people, they say he has a right to make a slave, and when I appeal to your *Honor*, your *Honor* says he has a right to make me a slave; and if any man, white or black, seeks an investigation of that claim, they make themselves amenable to the pains and penalties of the Fugitive Slave Act, for **BLACK MEN HAVE NO RIGHTS WHITE MEN ARE BOUND TO RESPECT.** (Great applause.) I, going to Wellington with the full knowledge of all this, knew that if that man was taken to Columbus he was hopelessly gone, no matter whether he had ever been in slavery before or not. I knew I was in the same situation myself, and that, by the decision of your Honor, if any man whatever were to claim me as his slave and seize me; and my brother, being a lawyer, should seek to get out a writ of *habeas corpus* to expose the falsity of the claim, he would be thrust into prison under one provision of the Fugitive Slave Law, for interfering with the man claiming to be in pursuit of a fugitive, and I, by the perjury of a solitary wretch, would by another of its provisions be helplessly doomed to life-long bondage, without the possibility of escape.

Some may say that there is no danger of free persons being seized and carried away off as slaves. No one need labor under such a delusion. Sir, four of the eight persons who were first carried back under the act of 1850, were afterwards proved to be *free men*. They were free persons, but wholly at the mercy of the oath of one man. And but last Sabbath afternoon a letter came to me

from a gentleman in St. Louis, informing me that a young lady, who was formerly under my instructions at Columbus, a free person, is now lying in the jail at that place, claimed as the slave of some wretch who never saw her before, and waiting for testimony from relatives at Columbus to establish her freedom. I could stand here by the hour and relate such instances. In the very nature of the case they must be constantly occurring. A letter was not long since found upon the person of a counterfeiter when arrested, addressed to him by some Southern gentlemen, in which the writer says:

"Go among the niggers; find out their marks and scars; make good descriptions and send to me, and I'll find masters for 'em."

That is the way men are carried "back" to slavery.

But in view of all the facts, I say, that if ever again a man is seized near me, and is about to be carried southward as a slave before any legal investigation has been had, I shall hold it to be my duty, as I held it that day, to secure for him if possible a legal inquiry into the character of the claim by which he is held. And I go further; I say that if it is adjudged illegal to procure even such an investigation, then we are thrown back upon those defences of our rights which cannot be taken from us, and which God gave us that we need not be slaves. I ask your Honor, while I say this, to place yourself in my situation, and you will say with me, that if your brother, if your friend, if your wife, if your child, had been seized by men who claimed them as fugitives, and the law of the land forbade you to ask an investigation, and precluded the possibility of any legal protection or redress—then you will say with me, that you would not only demand the protection of the law, but you would call in your neighbors and your friends, and would ask them to say with you, that these your friends *could not* be taken into slavery.

And now I thank you for this leniency, this indulgence, in giving a man unjustly condemned, by a tribunal before which he is declared to have no rights, the privilege of speaking in his own behalf. I know that it will do nothing toward mitigating your sentence, but it is a privilege to be allowed to speak, and I thank you for it. I shall submit to the penalty, be it what it may. But I stand up here to say, that if for doing what I did do on that day at Wellington, I am to go to jail six months, and pay a fine of a thousand dollars, according to the Fugitive Slave Law, and such is the protection the laws of this country afford me, I must take upon myself the responsibility of self protection; when I come to be claimed by some perjured wretch as his slave, I shall never be taken into slavery. And as in that trying hour I would have others do to me, as I would call upon my friends to help me, as I would call upon your Honor, to help me; as I

would call upon you (to the District Attorney) to help me; and upon you, (to Judge Biiss) and upon you, (to his counsel), I stand here to say that I will do all I can for any man thus seized and held, though the inevitable penalty of six months imprisonment and one thousand dollars fine for each offence hangs over me! We have all a common humanity, and you all would do that; your manhood would require it; and no matter what the laws might be, you would honor yourself for doing it, while your friends and your children to all generations would honor you for doing it, and every good and honest man would say you had done *right!* (Great and prolonged applause, in spite of the efforts of the Court and Marshal.)

Selected.

PRAYER FOR GUIDANCE.

Guide us Lord! while hand in hand
Journeying toward a better land.

Foes we know are to be met,
Snares, the pilgrim's path beset;
Clouds upon the valley rest,
Rough and dark the mountain's breast,
And our home may not be gained
Save through trials well-sustained.

Guide us while we onward move
Linked in closest bonds of love.
Striving for the holy Mind,
And the soul from sense refined,
That when life no longer burns,
And the dust to dust returns,
With the strength which thou hast given
We may rise to thee and heaven.

God of mercy, on thee *all*
Humbly for thy guidance call.
Save us from the evil tongue,
From the heart that thinketh wrong;
From the sins whate'er they be
That divide the soul from Thee,
God of grace, on thee we rest,
Bless us and we shall be blest.

GOD IS EVERYWHERE.

Oh! show me where is He,
The high and holy one,
To whom thou bend'st the knee,
And pray'st "Thy will be done!"
I hear thy voice of praise,
And lo! no form is near:
Thine eyes I see thee raise,
But where doth God appear?
Oh! teach me who is God, and where his glories shine,
That I may kneel and pray, and call thy Father mine.

Gaze on that arch above,
The glitt'ring vault admire!
Who taught those orbs to more?
Who lit their ceaseless fire?
Who guides the moon, to run
In silence through the skies,
Who bids that dawning sun
In strength and beauty rise?
There view immensity! behold my God is there—
The sun, the moon, the stars His Majesty declare?

See where the mountains rise:
Where thundering torrents foam;

Where, veild in low'ring skies,
The eagle makes his home!
Where savage nature dwells.
My God is present too—
Through all her wildest dells
His footsteps I pursue:
He rear'd those giant cliffs—supplies that dashing
stream—
Provides the daily food which stills the wild bird's
scream.

Look on that world of waves,
Where finny nations glide;
Within whose deep, dark caves
The ocean monsters hide!
His power is sovereign there,
To raise—to quell the storm;
The depths His bounty share,
Where sport the scaly swarm:
Tempests and calms obey the same Almighty voice,
Which rules the earth and skies, and bids the world
rejoice.

Nor eye, nor thought can soar,
Where moves not He in might;
He swells the thunder's roar,
He spreads the wings of night,
Oh, praise the work divine!
Bow down thy soul in pray'r;
Nor ask for other sign,
That God is everywhere—
The viewless Spirit He—immortal, holy, blessed—
Oh, worship Him in faith, and find eternal rest!
—Hutton.

LETTER TO THE LITTLE FOLKS.

"O here's our new friend, Aunt Sue!" Yes, here I am, and really glad to see you all so bright and cheerful. I hope you are all trying to be good and do good. "Now for a story." Well you shall have one; but first let me tell you I never make up stories; I always tell those that are true, things that have really happened.

The little girl about whom I am going to tell you I have known all my life. She is a woman now, and often warns little folks to act differently from the manner in which she acted. The story is sad, but the wise man, Solomon, said: "By sadness of the countenance the heart is made better." "Honor thy father and thy mother" is the first commandment with a promise accompanying it, and you cannot escape punishment if you fail to obey it. Little Sarah, as I shall call her, for I don't want to tell her real name, had a dear kind mother, who loved her very much, and did all in her power to make her happy. One cold day Sarah's mother desired her to go up stairs and bring her something which she needed for her work. Instead of getting up quickly, and going for it pleasantly, she said petulantly: "O I don't want to go! can't William or Charles go?" "No, my dear, I wish you to get it," said her mother, gently. "I have to do everything," said Sarah, slamming the door behind her, and and stamping up stairs. Her mother called her back, and she opened the door, saying crossly: "What do you want?" Her mother told her to shut the door easily, and to walk up stairs quiet-

ly, adding, while her mild blue eyes filled with tears, "Soon my little Sarah will have no mother; then she will be sorry for this behaviour."—Sarah went off, muttering to herself: "No danger of her dying; she only says that to worry me." Ah, poor child, she forgot to honor her mother.

Weeks passed on. Sarah's mother was taken sick; she grew worse and worse very rapidly, and before the snow and ice were gone they carried her away to the graveyard in her native village, laid her down deep in the earth, and left her there; and "Little Sarah had no mother."

An hour or two after Sarah's mother died, her father took his little ones to look upon her dear, dead face; he lifted them up to kiss her, and they gazed wonderingly upon her and upon each other, not knowing why their mother was so icy cold. When Sarah, who was the oldest, and came last to the bedside, touched her mother's marble brow with her lips, an awful weight seemed to fall upon her heart as *that afternoon's behaviour* rushed upon her mind with terrible force, and she wished within herself, "O that my dear, dear mother could come back a little while, that I might tell her how sorry I am, and show her how good I can be!" But it was too late then; she was "*sorry*," as her mother had told she would be; but her mother was gone to heaven, and her voice would never again be heard in prayer for her children. But I must stop: I feel too sadly to tell any more, except that, although Sarah's mother died twenty-eight years ago, she never thinks of her wicked conduct on that cold winter day without tears of sorrow. You don't want to feel so dreadfully when your parents die. I know, therefore remember to "honor thy father and thy mother, that thy days may be long in the land which the Lord thy God giveth thee."

Phila April, 1859. AUNT SUE.

HOW TO READ WITH PROFIT.

For the sake of those who are not accustomed to systematic reading, we make some suggestions as to the best mode of reading, so as to gain the highest advantage from the books they peruse:

1. Ascertain the *aim* of the author. You will thus know what to expect from his book, and may save much time, which might otherwise be spent in looking for what you could not find. An attentive reading of the title-page, preface, and table of contents, will enable you to judge pretty accurately what the author is about. Some facts, too, which float only among intelligent men, will aid you greatly in these matters.

2. Read *wakefully* and *attentively*, and with a determination to comprehend thoroughly the book you are perusing. Read neither credulously nor skeptically, but candidly; endeavoring to go to the root of the matter, if possible. One hour of such reading is worth a week of the superficial reading which is so common.

3. Read with a *good dictionary at your elbow*, and consult it freely whenever you meet a word you are not sure you understand. Webster and Worcester are the best in general use. We use Webster. Never pass an important word without mastering its meaning in the work you are reading. In this way you will soon gain a good stock of words for your *own use*, while you are learning the meaning of the book you are reading.

4. After reading a chapter, close the book and try to recall, and state briefly in your own language, the substance of the chapter, in the order the author pursues. This is one of the most profitable exercises. It will show you just how much you have gained by reading. If you cannot do this, just read the chapter again. The second reading will probably do you some good. The first reading has been of little use to you, if you are unable to state what the main thoughts are.

5. If the book is your own—but not if it is a borrowed one—you may mark with a pencil the most important thoughts. You will thus remember them more easily, and can refer to them more readily.

Adopting these suggestions, you will read slowly, but what you read will become *yours*. It will stir up your own thoughts, and probably develop your mental powers as healthfully as any other discipline you can have.—*Ohio Farmer*.

HUMBOLDT'S VIEWS ON SLAVERY.

It is the duty of the traveller who has closely studied what tortures and degrades human nature to bear the complaints of the unfortunate to such as can relieve them. I have studied the condition of the black countries where the laws, religion and national habits tend to soften their fate; and yet, quitting America, I feel the same abhorrence for slavery which I felt in Europe. It is in vain that intelligent writers, seeking to hide the barbarity of institutions by the ingenious trick of literary art, have invented the words, Negro-Peasant of America, "Black Vassalage," and "Patriarchal Protection"—that is perverting the noble arts of reason and imagination by deceitful comparisons or captious sophisms, in order to disguise the excesses which afflict mankind, and which prepare the way for violent convulsions. Does any one think he has a right to endeavor to avert our pity by comparing the condition of the black with that of the serfs of the middle ages, or with that state of oppression at which some classes in the north and east of Europe are groaning still? These comparisons, these tricks of rhetoric, that disdainful injustice with which some men reject as chimerical even the hope of the gradual abolition of slavery—these weapons are useless in the present time. The great revolutions which have taken place on the Continent and the Archipelago of the Antilles, since the beginning of the present century, have influenced public

opinion even in the country where slavery exists; it begins to be modified by them.

Without doubt, slavery is the greatest of all the evils which have afflicted mankind.

We cannot sufficiently praise the wise legislation of the new Republics of Spanish America, which, at their very birth, have seriously buised themselves with the total extinction of slavery. In this respect, that vast portion of the earth has an immense advantage over the Southern part of the United States, where the whites, in their struggles with England, have secured their own liberty; but where the slave population, which is already 1,600,000* in number, increases faster than the whites. If civilization should be transferred, instead of being extended; if, at the end of the great and deplorable convulsions of Europe, America, between Cape Hatteras and the Missouri, should become the chief seat of the intelligence of Christianity, what a spectacle would be offered by that centre of civilization, where, in the sanctuary of Liberty, we might be present at the probate sale of negroes after their owners' decease, and hear the sobbings of the parents separated from their children! Let us hope that the generous principles which so long have animated the Legislatures in the North of the United States will, little by little, extend toward the south and to those Western regions where, by an imprudent and fatal law, slavery and its iniquities have passed the Alleghany and the Mississippi. Let us hope that the power of public opinion, the progress of intelligence, the improvement of morals, the legislation of the new Continental Republic (of Spanish America), and the great and auspicious event, the recognition of Haytian Independence by the French government—either through forecast and fear or through more noble and disinterested feelings—may have a happy influence in ameliorating the condition of the blacks in the other West India Islands, in the Carolinas, (!) in Guiana and Brazil."

THE NEW MAN-MONKEY.

At the London Royal Institution, recently, Professor Owen delivered a lecture to a crowded audience on the Gorilla, the recently discovered animal of Central America, which bears the nearest resemblance to man of any one of the monkey tribes that has hitherto been discovered, not excepting the chimpanzee. The first traces of this creature were made known in England in 1847, and from the bones and sketches of it which Professor Owen received from the missionaries, he inferred that the Gorilla was one of the most highly developed species of the monkey group. In August last a specimen of the Gorilla, preserved in spirits, was received at the British Museum, and a well executed drawing of it, by Mr. Wolf, was exhibited. Professor Owen first point-

ed out the anatomical characteristics of the Gorilla, which distinguish it from other species of monkeys, and he afterwards mentioned such particulars of its habits as he has collected from those who have visited that part of Africa where it is found.

The points in which it approaches nearer to man than any other quadrumanous are the shorter arm—particularly the shortness of the humerus compared with the fore arm—a longer development of the great toe, a projecting nose bone, and the arrangement of the bones of the feet to enable the creature to stand more erect. The drawing of the Gorilla from the specimen in the British Museum, though only two-thirds grown, represented a most formidable animal, and compared with the skeleton of the full-grown specimen, the skeleton of man seemed very slim and delicate. Not only are the bones and muscles calculated to give great strength, but the large capacity of the chest indicated the powerful energy with which they were stimulated.

The part of Africa where the Gorilla is found lies from the equator to 20 degrees south, on the western portion, in a hilly country abounding in palm trees and luxuriant vegetation. Its food consists of fruit and vegetables, and its habitation is the woods, where it constructs nests of the intertwining boughs, perched at heights varying from 12 feet to 50. It avoids the presence of the negroes, and is but seldom seen, but it is known to them as "the stupid old man." The want of intelligence that has induced the negroes to give it that name is shown by its carrying away fruits and sugarcanes singly, instead of tying them together and carrying several off at the same time. It is in thus returning to take away its provender into the woods by peacemeal that the negroes take the opportunity of waiting for and shooting it. The Gorilla is a formidable enemy to encounter, and in case the gun miss its mark or only maim the animal, the negro is quickly overtaken and killed, or dreadfully mangled by the canine teeth of the creature. Sometimes when the negro is passing unawares under a tree, in which the gorilla is seated, it will reach down its arm and snatch the man up by the throat and hold him till he is strangled. The elephant is an object of its attack, as they both live on the same food, and holding on to a high branch with its hind feet, it will stoop down and strike the elephant with a club. The gorilla exhibits a strong attachment to its young, as an instance of which it was mentioned that a female and her two young ones having been seen in a tree, she snatched up one and ran with it into the woods and then returned to fetch the other. Her retreat had in the mean time been cut off, and when the gun was levelled at her, as she held her young one to her breast, she waved her arm as if to beseech for mercy. But it was in vain; for a bullet was sent through her heart, and the young one wounded and captured. The gorilla is some-

*Nearly 4,000,000 now.

times seen walking erect with its arms behind its neck; its usual mode of progression, however, is on all-fours. Professor Owen mentioned several other points in the habits of the animal, as well as in its osteology, to show its nearer approach to man than any other animals of the tribe; and he concluded by alluding to the fossil remains of quadrumanes, to show that the gorilla, like man, had not existed till the earth had attained its present condition.

THE HUMAN EYE.

As a mere piece of mechanism, the world nowhere furnishes such a beautiful and complex piece of machinery in so small a space. It is an epitome of the whole human system. Almost every tissue of the body is here represented; muscle, ligament, gland, serous, mucous, and fatty tissues, hair, follicles, nerves, blood-vessels and fluids; besides it furnishes some wonderful examples of Divine providence and omnipotence, of which no other part of the body affords such exact illustration. We have the mechanical power of the pulley; the retina, that mirror in the bottom of the eye, upon which all external images are depicted, and that astonishing power of adjustment, by which that distinct image is formed upon it, whether it be six inches or six miles off; the colored pigment to absorb the superfluous rays; the sensitive iris, that beautiful curtain which raises and lowers, adapting itself to the light which is afforded; and when we add the cornea, which gives stability and strength to the organ; the vitreous humor with which it is filled; the external defences; the arched brow, crowned with that hairy ridge which prevents substances from rolling into it, and the lashes which throw it off as they reach it; and the canal by which the tears are conveyed away after having performed their intelligent office—the work of lubricating the eye; we shall perceive that all nature's laboratory has been exhausted to produce this wonderful organ.—*Dr. Clark.*

ITEMS OF NEWS.

FIRE ENGINES.—A self-propelling steam fire engine has been built for the Southwark Hose Company of this city. The weight of the machine is nine thousand pounds, it consumes its own smoke and gas, and makes no more noise when in motion than an ordinary dray. The mate to her, in use in New York, throws a two inch stream two hundred feet, and an inch stream as far as it will go without breaking. That the machine in question will do the same will undoubtedly be shown when she is tested. Three of them already in use in New York, have saved hundreds of thousand of dollars' worth of property that would have been destroyed but for their assistance.

INDIA.—The government of India has recently published the result of a geological survey of that country, which contains many matters of scientific interest. During the five months' duration of the surveyor's visit, there fell in his field of observations nearly four hundred inches of rain, and there were only sixty-three days in which the amount was less than an inch.

BOTTLES.—Eight millions of bottles are annually made at a manufactory of bottles at Folembay, France. It is the largest manufactory of the kind in the world. The largest glass bottle ever blown was at Leith, Scotland. It was in dimensions forty inches by forty-two, and was capable of holding two barrels in quantity of fluid.

LOTTERIES.—The Philadelphia *Ledger* says that since the last act of the Delaware Legislature, renewing the lottery grants, the business has revived with redoubled activity, and lottery tickets and lottery policies are sold here in Philadelphia by the thousands. The business has got so bold, that scarcely an effort is made to conceal it.

A private despatch has been received at Boston, from Halifax, announcing the death of Rufus Choate, of Boston. He was one of the ablest lawyers and most eloquent orators of the country.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—In the Flour market there is no change. The receipts are trifling, but the stock is ample. Old stock superfine is offered at \$5 50 per barrel and fresh ground from new Wheat at \$6 25, but there is no inquiry for the former, and buyers refuse the highest quotation for the latter. The sales to the trade range from \$5 50 to \$6 25 for superfine and from \$5 75 up to \$7 for extras and extra family, according to freshness and quality. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 25 and the latter at \$3 75 per barrel.

GRAIN.—There is a fair demand for new Wheat, and prices are well maintained. Sales of 3000 bushels good and prime new Southern Pennsylvania red at \$1 40, and 700 bushels white at \$1 50 per bushel. Rye is steady at 85 cents. Corn is in limited supply, but there is very little demand for it. The last sale of yellow was at 86½ cts. Oats are dull; small sales of Pennsylvania at 40 cents per bushel.

CLOVERSEED comes forward slowly, and is in demand. Sales of 100 bushel fair and good quality in lots at \$5 50 a \$5 75. per 64 lbs. Timothy, if here, would readily command \$2 50. Flaxseed is worth \$1 60 a 1 70 per bushel.

A well qualified teacher is wanted to take charge of Darby Monthly Meeting School. Application can be made for further information to

RACHEL T. JACKSON or
M. FISHER LONGSTRETH

6th mo. 1st, 1859.

Darby P. O. Penn.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Atleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SEVENTH MONTH 30, 1859.

No. 20.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

(Continued from page 292.)

On Salvation by Christ.

James. In our last conversation, the attributes of the Divine Being and the Divinity of Christ, were discussed: and I now feel desirous of being better informed respecting the Christian doctrine of salvation.

Father. This is the most important subject that can possibly engage our attention; and we ought each one of us to take it into serious consideration, and endeavor to know by experience what it is to be saved from sin. It is an individual work; for "no man can save his brother, nor give to God a ransom for his soul;" but we must all "work out our own salvation with fear and trembling." Phil. ii. 12.

John. I should think this last quotation is not to be taken so literally as to imply that we can work out our own salvation without Divine assistance.

Father. Certainly not. It only means that we should accept the offers of Divine grace, and heartily co-operate therewith: for the apostle says in the next verse, "It is God which worketh in you, both to will and to do of his good pleasure." After all that we can do, our salvation must be attributed to God: for although it cannot be done without us, it is equally certain that it cannot be done of ourselves. "By grace are ye saved, through faith, and that not of yourselves; it is the gift of God." Eph. ii. 8.

The first point to be considered in this inquiry is, What is salvation? I think all must acknowledge, that it is a deliverance from the *guilt* and

dominion of sin, and consequently an exemption from the misery that is entailed upon sin, both here and hereafter. This view is confirmed by the whole tenor of the sacred writings; and it appears that the special object of Christ's mission was "to save his people from their sins." Mat. i. 21. A man cannot be truly said to be *saved from his sins*, while he is living in the daily practice of sinning. For "he that doeth righteousness is righteous;" but "he that committeth sin is of the devil." 1 John iii. 7, 8. The next inquiry is, What is sin? The apostle John answers, "Sin is the transgression of the law." John iii. 4. Well, what law is it that we are now living under? It is not the law of Moses; but the law of the new covenant, which is *written in the heart*. For, "This is the covenant that I will make with the house of Israel after those days, saith the Lord; I will put my laws into their mind, and write them in their hearts; and I will be to them a God, and they shall be to me a people; and they shall not teach every man his neighbor, and every man his brother, saying, Know the Lord: for all shall know me, from the least to the greatest. For I will be merciful to their unrighteousness, and their sins and their iniquities will I remember no more." Heb. viii. 10. Jer. xxxi. 33. It appears then, that sin is the transgression of this holy law: "for if our heart condemn us, God is greater than our heart, and knoweth all things;" but "if our heart condemn us not, then have we confidence towards God." 1 John iii. 20, 21.

Now if we will revert to our own experience, we shall find that every transgression of this law written in the heart, is followed by condemnation and disquietude: for the Divine Author of our being has so constituted the human mind, that we never can be happy while in a state of disobedience to his holy law; therefore he says, "Thine own wickedness shall correct thee, and thy backslidings shall reprove thee." Jer. ii. 19. "Say ye to the righteous, it shall be well with him; for they shall eat the fruit of their doings: but wo unto the wicked, it shall be ill with him; for the reward of his hands shall be given him." Is. iii. 10. "The work of righteousness shall be peace, and the effect of righteousness, quietness and assurance for ever." Is. xxxii. 17. This "peace of God, which passeth understanding" this holy joy and serenity of mind, which springs from "the love of God shed abroad in the heart."

is the only thing that can fill and satisfy the cravings of an immortal soul, which pants for the joys of eternal life. How important then is the inquiry, What is it that separates us from the Divine harmony, and cuts us off from the joys of paradise? "Behold," says the prophet, "your iniquities have separated between you and your God, and your sins have hid his face from you." Is. liv. 1. If sin separates the soul from God, it is clear that we cannot be united to him while we continue to be sinful: for "what communion is there between light and darkness? what concord between Christ and Belial?" But "thanks be to God for his unspeakable gift!" He not only sent his beloved Son into the world to "save his people from their sins," and to "destroy the works of the devil," (1 John iii. 8,) but he still reveals himself to man as a God "nigh at hand, a very present help in time of trouble;" and it is "through his mercy that he saves us by the washing of regeneration and renewing of the Holy Ghost." All he requires of man is, to repent of his sins by *turning away from them*, and to become obedient to "the law of the spirit of life in Christ Jesus, which makes free from the law of sin and death." This "law of sin and death" is the law which "wars in our members," (Rom. vii. 23, viii. 2,) and consists of "the lusts of the flesh, the lusts of the eye, and the pride of life, which are not of the Father, but of the world." It is needful that the power of God should be revealed *in man*, to overcome these spiritual enemies; and therefore his holy Word, or Spirit of truth, is sent to "convince the world of sin, of righteousness, and of judgment." This is that "grace of God which bringeth salvation, and hath appeared unto all men, teaching us, that denying ungodliness and worldly lusts, we should live soberly, righteously and godly in this present world." He who lives in obedience to this Spirit of truth, or grace of God, will find a continual growth and increase of strength, by which he will be enabled to resist temptation and to work righteousness; until, at length, it will become his study and delight to do the Father's will, and glorify his name on earth. This is the Emmanuel state, in which God becomes the life of the soul: for he is the Alpha and the Omega, the beginning and the end of our salvation. "I am the Lord," he says, "and besides me there is no Saviour." Is. xliii. 3, 11. "I am a just God and a Saviour: there is none besides me." Is. xlv. 15, 21, xlix. 26, lx. 16, Hos. xiii. 4. Therefore, unto him, "the only wise God our Saviour, be glory and majesty, dominion and power, both now and for ever." Jude, 25.

John. These views appear to be consistent with the scriptures, as far as they go; but it seems to me that a very important doctrine of Christianity still remains to be considered. I mean the doctrine of atonement.

Father. I have been speaking of what I con-

sider the doctrine of atonement or reconciliation. For it is admitted even by trinitarian writers, that "the doctrine of atonement, as far as relates to sin, is nothing more than the doctrine of reconciliation." And indeed, in a sense agreeable to this, that of bringing into a state of concord and reconciliation, the word atonement itself had been originally used by old English writers, with whom, according to Junius, Skinner and Johnson, it was written *at-one-ment*;—signifying to be *at-one*, or to come to an agreement. [See *Magee on Atonement*. pp. 184, 186.]

Now, it appears to me that God is altogether unchangeable himself and perfectly pure and holy; and therefore, the sinner cannot be in a state of *concord and reconciliation* with him, until his sinful nature is removed by "the washing of regeneration and renewing of the Holy Ghost." Thus, "putting off the old man with his deeds, and putting on the new man, which is renewed in knowledge, *after the image* of him that created him." Col. iii. 9, 10.

(To be continued.)

From the London Friend.

SOME OBSERVATIONS ON THE PRIVATE CHARACTER OF JOSEPH STURGE.

"In venturing to make a few observations on the character of my late dear and honored friend Joseph Sturge, which I hope may be profitable to some of the readers of *The Friend*, I shall scrupulously avoid entering upon any sketch of his most useful and devoted life, as I sincerely hope it will fall into abler hands than mine to prepare a memorial of him, which will be both interesting and instructive to the public at large.

There are some points, however, of a more private character, to which I think it may be well to allude in the periodicals which circulate in the religious Society to which he belonged.

It may be well supposed that a man whose generous and loving heart seemed large enough to embrace within its sympathies almost the whole human race, would evince towards the members of his own family all the warmth and sincerity of a most disinterested affection. And so it was. Joseph Sturge ever manifested such tenderness and sympathy towards the various members of his family circle, that he seemed like a magnet of love, drawing all together in a bond of uninterrupted union, which was not only a source of mutual happiness, but by its reciprocal influence was made instrumental to the enlargement of the sphere of public usefulness which he so nobly occupied.

The sympathy and assistance he received from the members of his own family during his long and varied public labors it is difficult fully to estimate; but it was ever felt and acknowledged by our departed friend with all that warmth and generosity which marked his general character.

It is not for me to enter into any details of this delightful reciprocity, although I know how much it assisted Joseph Sturge in his public labors, and how anxious he was to acknowledge what he owed to others for his release from much of the toil, and detailed attention, to a large and sometimes anxious business. Nor should it be forgotten, in the vast amount of writing which his diversified engagements involved, how truly valuable to him was the help rendered by his devoted sister, Sophia Sturge. The affection which subsisted between them from childhood was remarkable, and it is not easy adequately to appreciate the support and the strength this sister was to him through a series of years, until the close of her life in 1845.

But in speaking of his social and domestic relations, his conduct towards those who served him, both in his household and in his business, must not be omitted. Joseph Sturge was not only a kind and generous master, ever attentive to the physical comforts of those he employed, but he felt deeply the responsibility of his position, as it regarded their religious interests and their moral improvement. The whole of the men in the employ of the firm at Gloucester were every year invited, with their wives and families, to partake of a bountiful tea; and the invitations to this annual party being extended to various classes, the number who met on these occasions was seldom much under three hundred. The evening was occupied by addresses on various subjects, well adapted to improve and elevate, as well as to interest, those for whose enjoyment it was intended. At the close of the meeting each workman, as he retired from the room, was presented by Joseph Sturge with a packet of books, for the reception of which he provided a few years ago a small bookcase in each of their cottages. But that which, I believe, made a far deeper impression on the minds of these men and their families than any pecuniary liberalities, was the kindness and sympathy which Joseph Sturge evinced in visiting them at their own homes. To visit from seventy to eighty houses, rather widely scattered, was no light duty, and I believe often occupied several days, but these visits will be long and gratefully remembered by those who received them, and, combined with the general influence of Joseph Sturge's character, I have no doubt, have been mainly instrumental in raising the character of the men to a standard considerably above the general average.

If time and space would admit, I could relate some touching instances of his kind and delicate attentions to his domestic and other servants; but I trust I have said enough to awaken in the minds of others a desire to follow the example of one who, by the influence of divine grace, was enabled so beautifully to exemplify the character of a Christian master.

It was, however, in the parental relation that

he most strikingly exhibited the tenderness of his affectionate heart; and blended with this tenderness was a deep sense of his responsibility in the training of the beloved children whom God, in his providence, had entrusted to his care. Most truly was the government of his children a government of love!

Though arrived at that period of life when rest and quietude are most congenial, he yet constantly joined his little children in their recreations, and entered into their juvenile amusements with all that heartiness and cheerfulness which are so attractive to the young. Doubtless he looked upon this manifestation of sympathy as calculated to strengthen him in his efforts to lead them to their God and Saviour. But whilst he daily recognized the duty of religiously instructing his children, he yet deeply felt that without the divine blessing upon this labor of love, it would prove ineffectual in promoting the soul's salvation. Scarcely a night passed when he was at home that he did not sit by the bedside of his only boy, and there evince by his affectionate language, his tears, or his prayers, his deep solicitude for the present and eternal welfare of his now fatherless child. May the Lord in his mercy abundantly answer those bed-side prayers, and may He give to every one of us who are parents the inclination and the ability to imitate so bright an example of paternal love!

There are few things, I believe, which more correctly test the spiritual condition of parents than the interest they take in the religious instruction of their children; if their hearts are warmed by the love of Christ, and softened by the tendering influences of his Spirit, they will enter upon this important duty with hopefulness and pleasure; but if their own hearts are cold and indifferent to the things of God, they will feel it a lifeless, if not a painful duty, to perform. How solemn and touching to the affectionate parent must be the reflection that his continued refusal to accept in true contrition of soul the mercy of God in Christ Jesus, is not only jeopardizing his own soul, but alas! may endanger the spiritual welfare of his dear children, or lead to the awful consummation of an eternal separation from them. I think we can scarcely over-estimate the reciprocal advantages to both parents and children, of early religious instruction; and if that instruction is occasionally impressed on the loving child by a tender mother's tears, or an affectionate father's prayers, it will greatly deepen the impression, and may prove, by the divine blessing, a source of help and strength to the faltering child in after periods of temptation and trial, if it does not at once produce all the fruit they could desire.

And here I must say, in passing, that whilst I would by no means encourage the offering up

of vocal prayer, without some sense of need, and some feeling of love to God our Saviour; yet I do believe if the voice of supplication, or a simple word of encouragement or exhortation, was more often heard in our families, it would be a mutual benefit in promoting the growth of divine grace in the hearts of those who hear, and of those who speak.

The liberality with which Joseph Sturge contributed to almost every benevolent object which he considered worthy of support, has probably led to an over-estimate of his pecuniary means; but whatever may have been the amount of his property in later years, there was a time in his earlier life when he was so far straitened in his circumstances, as to feel it his duty to circumscribe his housekeeping expenditure to £100 a year. But the desire to share with others whatever he possessed kept pace with an increasing income, and if this course had not been dictated by his naturally kind and generous heart, it would have been pursued under a deep sense of his responsibility to God, as a steward of his manifold gifts. But the mode in which this duty and stewardship were fulfilled, developed one remarkable and very interesting feature in Joseph Sturge's character—namely, his uniform and Christian simplicity.

Generous hospitality was the characteristic of his house; but there was no display—no equipage—none of the assumption of position or appearance of luxury which we sometimes see in the establishments of Friends, who seem scarcely aware of its inconsistency with their Christian profession, or with the advocacy of the continuance of what are termed the peculiarities of Friends. I trust the consistency of our dear departed friend's example of Christian moderation adds weight to the views he so feelingly expressed on this subject in the last Yearly Meeting he attended.

There are other traits in Joseph Sturge's character which might be illustrated with interest and profit, but I feel that I have already trespassed largely upon your columns, and will therefore conclude this notice of some parts of the more private life of one of the most generous and devoted Christian philanthropists it was ever my privilege to know.

SAMUEL BOWLY.

SOME EXTRACTS FROM THE WRITINGS OF OUR DECEASED FRIEND, JACOB L. MOTT.

(Concluded from page 292.)

Happiness of Resignation.

Man may have the natural or acquired ability to deliver elegant orations, (either extemporaneously or by previous preparation,) and these may be couched in the language of Christ and his true ministers in different ages of the world, and they may impart much creaturely zeal, both in the

speakers and hearers, and move their natural feelings powerfully, and yet produce no real conversion to God, neither promote the advancement of his cause.

Oh, how necessary it is for those who are called to the work of the ministry to be faithful, feeling as Paul did, "Wo is unto me if I preach not the gospel." That they should not only feel it a necessity laid upon them to preach the gospel, but to keep close to their commission, which is not to convert or proselyte unto themselves, but unto Christ. "For other foundation no man can lay than that which is already laid; Christ revealed, the power and wisdom of God." No other saving principle can be preached than that which regenerates the heart, causing a surrender of the will of man to the guidance of his Heavenly Father.

Then let none be discouraged. "They that be wise shall shine as the brightness of the firmament; and they that turn many to righteousness as the stars, forever and ever." The true minister trembles when he stands in the presence of God as a public advocate for his glories.

I most fully believe in the Scriptures of truth, and cannot trifle with those sacred writings. The Society of which I am a member has never denied their authenticity, nor the account which the evangelists give of that stupendous miracle, the conception and birth of Christ, nor of other miracles therein recorded. Never have we doubted them, but with admiration and gratitude contemplate His holy example and humble resignation in that awful hour, when he felt the weight of that work upon him for which he came into the world, which caused him to cry out, "My God! my God! why hast thou forsaken me!"

I consider it extremely dangerous to indulge in speculations upon subjects connected with the Christian religion: to those who are endeavoring to be wise above what is revealed, Paul gives a merited reproof, "Thou fool!"

Some are so weak and low in their conceptions as to imagine that metaphors, by which invisible things are illustrated by visible, are to be taken literally, while others refine away everything until realities are called in question.

The Divine Master, to comfort his immediate followers, told them, "In my father's house are many mansions; if it were not so I would have told you." The humble Christian, the child of God, instead of dwelling on the query—how or where is this mansion? can repose in confidence, that when he shall have passed the time of his probation here, he may commit his spirit into the hands of his Heavenly Father.

No one can fail to perceive the superior beauty and sublimity of the language of the Scriptures, nor will the frequent repetition surprise us, when we consider that much of it is figurative and poetical; as for instance, "The fields smile;"

"The stars cry out;" "The floods clap their hands," &c.

In a letter to a friend a short time previous to his death, he says: I feel it right to recommend to parents that, while bringing up their children, they encourage them to read the Scriptures of truth. I have found much comfort in them during this long sickness; passages and circumstances are frequently brought to remembrance that are like bread cast upon the waters, found, and become food after many days.

Although he seldom appeared in vocal prayer, it appears from his writings on paper that he not infrequently poured out his suppliant feelings in retirement, from which the following is selected:

In commemoration of thy mercy, thy infinite mercy, Oh Father, I bow before thee, and with the voice of thanksgiving and praise offer the tribute which is due to thee alone. I acknowledge, with thy ancient servant, David, Oh Lord, my God! thou art very great, thou art clothed with honor and with majesty. Thou coverest thyself with light as with a garment. Thou stretchest out the heavens like a curtain. Thou makest the clouds thy chariot; thou walkest upon the wings of the winds; thou visitest thy dear children with every of thy sure mercies, even to the ends of the earth, and enable them to look unto thee, and to receive strength to cry, Abba, Father. Bless the Lord, Oh my soul, and forget not his benefits, who forgiveth all thine iniquities; who redeemeth thy life from destruction; who crowneth thee with loving kindness and tender mercies. Give ear, Oh 'thou who dwellest between the cherubims, shine forth in mercy upon us, we commemorate thy gracious condescension, and pray for a continuation of thy favors. Although thou art centred in the eternal tribute, Holy! Holy! Holy! and hallelujahs of glorified spirits, angels and archangels, yet thou art with the humble and contrite soul, that trembles at thy word.

Like the Apostle Paul, he knew how to abound and how to be abased, as the following record of his experience testifies.

The beloved of my soul, who in my tender state had so graciously filled my heart, now hid his face from me, and I was not indulged with those seasons of solace which I had before enjoyed. I waited for the return of the dearest object of my soul, often querying, Why stayeth my beloved so long, or what have I done since his last embrace, to occasion this withdrawal of his presence? I was impatient; I sought him in my chamber, in meeting, and in the fields—places where I used to receive his favor, but these seemed to have lost their charm since my beloved was not there. I sought him, but I found him not. Like the spouse in the Canticles, I was ready to ask, "Did you see my beloved?" I was disconsolate day and night, and may say I mourned as

a dove who had lost his mate. My tears moved not his pity, and his ears seemed deaf to all my cries, whilst imperious watchmen wounded me, and the cruel enemy upbraided me with all I had gone through for my beloved's sake, telling me I had better stayed in Egypt, than thus to languish in the wilderness. Great indeed were the conflicts I met with, not knowing why it should be thus, and fearing that I was dying to all that was spiritual; yet my soul was encouraged to wait a little longer, and some days after, to my inexpressible joy, I felt the sweet influences of Divine Love, saying to my soul, "Follow on to know the Lord; Joseph, spiritual Joseph, is yet alive."

Oh, here I found again that inestimable jewel, the pearl of my best affections and the life of my hope, with such revivings as Jacob experienced when he had the assurance of the welfare of his son: and my soul, bowed under an humbling sense of gratitude, said, "*it is enough, it is enough,*" I will go down and see him before I die.

On another occasion he writes: When brought into a state of musing, what an immense field has the light of truth unfolded to my view. The whole universe, governed in all its parts with infinite wisdom, unbounded goodness, and Almighty power, glorious attributes of Divinity, whose omniscient eye pervades the whole, so that not even a sparrow shall fall to the ground, a leaf move, or a thought exist in the mind, without his notice; then how true is the doctrine that God searcheth the heart and trieth the reins of the children of men, and that "In him we live and move and have our being." That if we take the wings of the morning and fly unto the uttermost parts of the earth—if we descend into the deep or ascend to heaven, the darkness and the light are both alike to Him, from whose presence none can flee. Day unto day uttereth speech, and night unto night sheweth knowledge. What mind, enlightened from above, can contemplate, without grateful aspirations and profound veneration, that fountain of goodness and love; who inspires of his fullness, "All things are of God." Oh, how broad the expanse of mental vision! What mind can doubt his goodness and love? or that he continues to inspire his children? "Who art thou, Oh man, that shall attempt to scan or limit the attributes of God?" "Eye hath not seen, nor ear heard, nor the heart of man conceived the good things that God hath in store for them that love his appearance; with the glories he shall reveal." Where shall limits be found to man's exaltation? when raised in the image of God, he shall tread the courts of the highest heaven, being allied to him, joint heir with Christ in an inheritance that shall gladden the soul through an endless eternity. "For the glory of the Lord shall endure forever;" the Lord shall rejoice in his work. The Lord shall reign forever and ever, even thy God Oh Zion.

FEMALE INDUSTRY.

(Continued from page 292.)

In the United States, the telegraphing is largely consigned to women; and with it the kindred art of the compositor. From what we have heard in various directions within a few years, we believe that the manipulation of type by women is found to be such an advantage here that a great deal of our printing is likely to be done by them henceforth. Much was said beforehand about the impossibility of their enduring the smells of the office, but the same thing used to be said of oil-painting; and in both cases it is a mistake. If printing is on the increase among women, much more so is painting in oils and on glass. Printing reminds us of book-binding, which affords an admirable occupation to women. One well-known firm was, some few years since, employing 200 young women, under careful arrangements for their moral welfare, technical improvement, and daily comfort. Such means of instruction were provided as prevented their domestic qualities from being spoiled by their regular business. For the sake of quiet and respectability, little was said where so much was done: but the few who saw the workrooms, and followed the processes, from the folding of sheets to the highest ornamentation of the covers, are not likely to forget that spectacle of cheerful and prosperous industry.

Before quitting the commercial department of female industry, we must remark that in all countries, and at all times, the fitness of assigning to women what may be called the hospitable occupations had been admitted. In metropolitan hotels the presence and authority of a master may be requisite; but, all through the country, the image of a good landlady presents itself when rural inns are in question. Throughout our literature, the country landlady is a pleasant personage; and we hope it may be so for ages to come. She makes the angler welcome, and gives him a luxurious home during his summer holiday; and she cooks his fish as no other woman knows how to do. Her sister in the sporting county has a similar abode to offer in autumn, among stubble fields, and near some choice covers; and she is as admirable at game as her sister in fish. A pleasant landlord is very well; but a widowed hostess is fully up to the duty, and seems rightfully to fill the place. And so it is where the scenery is the attraction. She is weatherwise for the advantage of her guests. She can tell them at what time of day they should see the waterfall with its rainbow or slanting sunbeam. She can fit up the boat comfortably for delicate ladies or dreaming poets. She puts up good luncheons for explorers and mountain climbers; and when they come home wearied and hungry, she has the bright little evening fire ready, and the tempting light supper, and the clean airy bedroom. The race of rural landladies ought never to die out;

nor should woman's stake in institutions of hospitality ever be withdrawn.

We are told that boarding house life will become more common than it has been. We have boarding-houses in London and Edinburgh, Liverpool and Hull, and other towns, for foreigners accustomed to that mode of living at home. We see also, more and more, the tendency of our bachelors, young and old, to dine anywhere but at their lodgings. Some go to luxurious clubs; some to boarding-houses; some to chop-houses; and some to cooks' shops, of various grades. Bad cooking seems to be both cause and effect of the growing change. An ill-cooked-dinner, repeated sufficiently often, sends the lodger elsewhere for his chief meal; and the want of daily practice on the lodger's dinner causes the landlady to lose any skill she might once have had. Thus is swelled the popular lamentation over the decay of the art of cookery among the working women of England, from the peasant's wife, who gives her household dry bread or watery potatoes, to the great lady of the first-class inn, who is as helpless among her own servants as if she had come from another planet.

This is a topic worth a pause;—if indeed it be a pause or interruption to speak of an art which would, any day, make the fortune of any working woman who was skilled in it. Some of us, it may be hoped, have wives who are not bent on inflicting on us, in our leisure hours, the kitchen troubles of our own or our neighbors' houses: yet every man of us is aware that one of the irksome cares of life at present is the difficulty of obtaining cooks who can send up wholesome meals to the nursery (a thing of superlative importance), or satisfy the most moderate tastes of the dining-room. We are constantly hearing that the art of domestic cookery is declining in this country, and almost gone. After some deep reflection, and comprehensive observation on this matter, we are disposed to think that there is a good deal of exaggeration in some directions, while the evil is plain enough in others. Count Rumford's Essays prove that cottage cookery was, throughout many counties, as bad in the last century as it is now. The contrast which he pointed out between the prisoners of war who made a warm, savoury dinner out of a red herring and bread and water, and the natives round their prisons who ate up the same value in the shape of a slice of dry bread, and whose wives and mothers insisted that it must come to the same thing because it cost the same, was as striking as any cottage picture of a skill-less meal that we can offer now. Our religious tracts and other sermonising books for the poor tell us, as imaginative grandmothers used to do, of the laborer's home, where the wife made a good stew, every day, and there was always the hot juicy rasher or the Welsh rabbit for the good man's supper; but Count Rumford's account was the true

one; and the people [of more ranks than one] laughed to scorn his news that the process of cooking could alter the actual nourishment conveyed by a given portion of food. But there can be no doubt that the middle class of our countrywomen are far less skilled in the knowledge and practice of cookery than their grandmothers, who were themselves apparently inferior to *their* grandmothers. We are not going into the old controversy about how much time and thought the cares of the store room and kitchen used to occupy, and how much they ought to occupy. It is enough that the gentlewomen of a former century could not be said to be inferior in sense, intelligence, and manners to those of our own time; and that we have therefore every reason to believe that our wives and sisters would be no worse for understanding the business of the kitchen. The learning and graces of some of the ancient ladies of England compel us to suppose that, in each age, such narrowness or shallowness as exists is owing to restrictions on intercourse, by war or other influences; and that if the opportunities of our day had been granted to our ancestors, the dames would have been as accomplished as ours are, without being worse cooks. Well! is the art to be lost? or will an effort be made to recover it?

Our wives complain that they never had an opportunity of learning it. Their mothers took no notice of their natural wishes [every girl has an innate longing, we are confident, for the household arts, if nature had but her way]; and the consequence is—a heavy weight of care on the heart in marrying, and many an hour of keen mortification afterwards, in addition to the constant sense of inability and dependence, and dread of shame and tacit reproach. Such is the wife's confession, when she can bring herself to make a clean breast of it. But what can be done for the daughters? There used to be means of instruction in cooking and in sewing, as there now are in drawing and music. Why is it not a branch of female industry now to give such instruction, instead of leaving those departments of knowledge a blank, while hundreds of governesses are starving or living on charity, in the workhouse or out of it? It may not be necessary or desirable for young ladies to spend so many hours in the still-room, among conserves and quackeries, as the damsels of three centuries ago, when kitchen cookery was gross and wholesale; and it might be better that they should learn from their mothers how to order and superintend the administration of food; but if their mothers have not the requisite knowledge, skill and ideas, it would be a great blessing to have a professional instructress within reach. By none, we fear, is such a training more needed than by the heads of boarding-houses in England. Our ordinary tables d'hôte are almost as bad as the American, in regard to cookery. How different are the

German, where every lady is a trained cook! If the ladies of London complain that their husbands spend more and more time at the clubs, and take fewer meals at home; if boarding-house keepers find the business not a good one in England; if lodging-house keepers complain of the small gain of inmates who only sleep at home; let them all look to their consciences as to the table they offer, and say whether it is not reasonable that we should go for our dinner where we can have a good one for the same cost as a bad one.

A suggestion has been made and repeated, but not yet acted on, we believe, that lecturers should travel through the country with a portable kitchen, to give instruction in plain cookery, as improved by modern science and art, and especially by the discoveries of the lamented Soyer. Humble housewives were chiefly in the view of the adviser,—the wives and daughters of small tradesmen, artisans and cottages, who might become convinced, by the evidence of their senses, of the economy and luxury of a good treatment of the commonest articles of food. It would be a great work if some educated woman would try the experiment. Its direct success is more than probable; and it might introduce into our towns a regular method of instruction in establishments where young women of almost every rank would thankfully become pupils. Is not this one of the undisclosed paths of industry in which there would be no interference by the jealousy of men?

If the complaint be well founded, that there are no good cooks to be had for middle class households, why is such an evil permitted? If womankind has always had a faculty for that kind of achievement, how comes it to be in abeyance in England at present? Whose fault is it, if we are ill-supplied with cooks? The only use of asking the question is to learn how to supply the need. One mischief, no doubt, is the wrong-headedness with which we have gone to work in our popular schools, in our zeal to elevate the laboring classes.

Mrs. Austin quotes, in her useful little tract, the prospectus of a school, instituted by Miss Martineau of Bracondale near Norwich, for the education of a few girls of the shopkeeping and artisan class, apparently. Two old-fashioned adjoining houses are devoted to the object; and there is a good play-ground. For sixpence a week a sound practical education is given.

'This is the skeleton of the scheme,' Mrs. Austin says of the prospectus, 'which differs in nothing from a common day school, save in the things taught, and above all, in the direction given to the tastes and habits of the pupils. Without seeing it in operation, it is impossible to imagine the life and energy which Miss F. Martineau and her excellent assistants have infused into it. The lessons on objects, which I heard, those on arithmetic, and the writing, were excellent.'

The attention of the children never flagged. Their eyes were fixed with eager inquiry on the cheerful animated face of their young mistress. But excellence in these branches is not rare. Miss Martineau, in a letter now before me, touches the true points of superiority in her school and its mistress: "I think myself very fortunate in having a mistress so capable of teaching the higher branches of knowledge, and yet so anxious to give an interest to all home and useful duties. The idea of *taking pleasure* in cutting out their own clothes, washing, &c., seems so new to the children."

'According to Miss F. Martineau's wise plan of feeling her way, and attempting nothing on a large scale till she has proved its success on a small one, the girls at present only wash for the mistress and the housekeeper, who is their-instructress in this department.

'On the same principle of slow and cautious advance, cooking has as yet not been attempted. This will come hereafter. Every needful appliance is ready. Meantime, an important step in domestic education has been gained. Those of the girls who live a distance bring their dinners. Their humble repast is set out and eaten with the nicest attention to cleanliness and propriety. I saw the table exactly as it had been left by the girls who had just dined. Not a thing was out of its place, nor was there a trace of untidiness or disorder. The service of the table is performed by the girls in turn. They clear away the dishes and plates, knives and forks, clean them, and deposit them in their places. I saw one at her work washing the earthen vessels, wiping, *not smearing* them, and arranging them, dry and bright, on pantry shelves of spotless whiteness. It was with peculiar satisfaction that I soon afterwards saw the same girl come into the school and teach a class of younger girls arithmetic.' (Pp. 18-20.)

By an introduction of a subsequent date, we learn that at first the cooking was a difficulty,—the parents preferring sending the children with cold food of greater cost, to paying a small sum which would enable them to have a warm meal, with the benefit of learning to cook it. But the opposition was gradually giving way.

A letter to the 'Times' (January 29, 1858), from the Vicar of Sandbach, Cheshire, exhibits the next scene of progress;—a scene which contrasts remarkably with that of a learned philological inspector, hammering his abstractions into girls who had no idea how to discharge any one duty in life, and were certainly not at all likely to learn it from him.

'The results of the Sandbach National School kitchen for the sick and aged poor, are—that with the sum 77l 12s 6½d., derived chiefly from the offertory collections, 852 dinners of roast mutton, 307 of mutton chops, &c., making in all 2,104 meat dinners, with 176 puddings, and

102 quarts of gruel, were supplied to the village, simply by the adoption of a judicious and economical system of cookery.'

Mr. Armistead adds—

'It is a matter of thankfulness, though not of surprise, that a system so easy and simple of operation should have excited an amount of inquiry, personal and by letter, to an extent which leads to a well-grounded hope that in a few years a kitchen will form a necessary part of the National School of every large parish throughout the kingdom, a result no less beneficial to the sick poor than to the children themselves, thus early initiated in industrial employments well suited to their condition in after life.'

(To be continued.)

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SEVENTH MONTH 30, 1859.

We acknowledge the reception of an article from J., and like the spirit it manifests, but it is not written with sufficient clearness for publication.

Communicated.

DIED, at his residence in Smith Township, Mahoning County, Ohio, of a lingering illness of several years standing, JOHN TRAGO, in the 46th year of his age. He was a consistent member of West Monthly Meeting, and had recently been recommended a Minister, in which capacity he was much esteemed, his communications being of a practical and original character. The funeral took place in the afternoon of the next day, at West meeting house, attended by an unusually large number of friends, and neighbors. A few words were spoken in reference to his life, and character, a deep solemnity appeared to spread over the assembly, and a feeling of sympathy with the afflicted family seemed to pervade the mind of most present. He has left a fond wife, two affectionate daughters, an aged mother, brother and sister, as well as a number of other and more distant relatives to mourn their bereavement; but they are consoled by the reflection that their loss is his eternal gain. He expressed when apparently under much suffering, he had many seasons of sweet comfort they knew not of; his countenance was ever bright and cheerful, not a murmur escaped from him, so that it might be truly said, his "peace seemed to flow as a river." Thus much it has been thought right to say of our dear departed friend.

—, on the 4th inst., near Rising Sun, Cecil Co., Md., in the full faith of a blissful immortality, she having given satisfactory evidence that she was prepared, MERCY W. daughter of David and Anna Amelia Phillips, aged 22 years.

—, On the 25th inst., JOSIAH, son of T. Ellwood Chapman, in the 21st year of his age.

If thou hast done an injury to another, rather own it than defend it. One way thou gainest forgiveness; the other, thou doublest the wrong and reckoning.—PENN.

FOOTPRINTS IN THE ROCKS.

Unbelievers in geology often ask, "How was it possible for animals or reptiles to make the impressions which are now said to be their footsteps preserved in the solid rock?" Hugh Miller had a rare faculty of finding apt illustrations from daily life of the abstrusest theories of science, and in his "Popular Geology," just published a work of singular fascination and eloquence, he tells the following incident, which answers this perplexing question:

"The strange reptiles of this ancient time, in passing over the tide-uncovered beaches of the district, left their footsteps imprinted in the yielding sand; and in this sand, no longer yielding, but hardened long ages ago into solid rock, the footsteps still remain. And with truly wonderful revelations—revelations of things the most evanescent in themselves, and of incidents regarding which it might seem extravagant to expect that any record should remain, do we find these strange markings charged. They even tell us how the rains of that remote age descended and how its winds blew.

Let us see whether we cannot indicate a few of at least the simpler principles of this department of science. The artificial sheet of water situated among the Pentlands, and known as the Compensation Pond, was laid dry, during the warm summer of 1842, to the depth of ten fathoms; and as a lake bottom, ten fathoms from the surface, is not often seen, I visited it in the hope of acquiring a few facts that might be of use to me among the rocks. What first struck me, in surveying the brown sun-baked bottom from the shore, was the manner in which it had cracked in the drying into irregular polygonal partings, and that the ripple-markings with which it was fretted extended along only a narrow border, where the water had been shallow enough to permit the winds or superficial currents to act on the soft clay beneath. As I descended, I found the surface between the partings indented with numerous well-marked tracks of the feet of men and animals, made while the clay was yet soft, and now fixed in it by the drying process, like the mark of the stamp in an ancient brick. And some of these tracks were charged with little snatches of incident, which are told in a style remarkably intelligible and clear. At one place, for instance, I found the footprints of some four or five sheep. They struck out towards the middle of the hollow, but turned upwards at a certain point, in an abrupt angle, towards the bank they had quitted, and the marks of increased speed became palpable. The prints instead of being leisurely set down, so as to make impressions as sharp-edged as if they had been carved or modelled in the clay, were elongated by being thrown out backwards, and the strides were considerably longer than those in the downward line. And, bearing direct on the retreating foot-

prints from the opposite bank, and also exhibiting signs of haste, I detected the track of a dog.

The details of the incident thus recorded in the hardened mud were complete. The sheep had gone down into the hollow shortly after the retreat of the waters, and while it was yet soft; and the dog, either acting on his own judgment, or on that of the shepherd, had driven them back. A little further on I found the prints of a shod foot of small size. They passed onward across the hollow, the steps getting deeper and deeper as they went, until near the middle, where there were a few irregular steps, shorter, deeper and more broken than any of the others; and then the marks of the small shoes altogether disappeared, and a small naked foot of corresponding size took their place, and formed a long line to the opposite bank. In this case, as in the other, the details of the incident were clear. Some urchin, in venturing across when the mud was yet soft and deep, after wading nearly half the way shod, had deemed it more prudent to wade the rest of it barefoot than to bemoan his stockings. In each case the incident was recorded in peculiar characters; and to read such characters aright, when inscribed on the rocks, forms part of the proper work of the ichnologist. His key, so far at least as mere incident is concerned, is the key of circumstantial evidence; and very curious events, as I have said—events which one would scarce expect to find recorded in the strata of ancient systems—does it at times serve to unlock.

In some remote and misty age, lost in the deep obscurity of the unreckoned eternity that hath passed, but which we have learned to designate as the Triassic period, a strangely formed reptile, unlike anything which now exists, paced slowly across the rippled-marked sands of a lake or estuary. It more resembled a frog or toad than any animal with which we are now acquainted; but to the batrachian peculiarities it added certain crocodilian features, and in size nearly rivalled one of our small highland oxen. The prints it made very much resembled those of a human hand; but, as in the frog, the hinder paws were fully thrice the size of the fore ones, and there was a gigantic massiveness in the fingers and thumb, which those of the human hand never possess. Onward the creature went slowly and deliberately, on some unknown errand, prompted by its instincts; and as the margin of the sea or lake, lately deserted by the water, possessed the necessary plasticity, it retained every impression sharply. The wind was blowing strongly at the time, and the heavens were dark with a gathering shower. On came the rain; the drops were heavy and large; and beaten aslant by the wind, they penetrated the sand, not perpendicularly, as they would have done had they fallen during a calm, but at a considerable angle. But such was the weight of

the reptile, that, though the rain drops sank deeply into the sand on every side, they made but comparatively faint impressions in its footprints, where the compressive effect of its tread rendered the resisting mass more firm. "We have here, in a single slab," says Dr. Buckland, in his address to the Geological Society for 1840, in referring to these very footprints and their adjuncts—"we have here, in a single slab, a combination of proofs as to meteoric, hydrostatic, and locomotive phenomena, which occurred at a time incalculably remote, in the atmosphere, the water, and the movements of animals, from which we infer, with the certainty of cumulative circumstantial evidence, the direction of the wind, the depth and course of the water, and the quarter toward which animals were passing. The latter is indicated by the direction of the footsteps which formed the track; the size and curvature of the ripple marks in the sand, now converted into sandstone, show the depth and direction of the current; while the oblique impressions of the rain drops register the point from which the wind was blowing at or about the time when the animals were passing."—*Boston Journal*.

SKETCHES OF CHARACTER.

FROM THE LIFE OF M. A. SCHIMMELPENNINGCK.

Amongst the visitors who continually sojourned with us at Barr, were the venerable Judge Oliver and his niece Miss Clarke, with whom, as I have mentioned, an acquaintance had begun at Five Ways; the eccentric Lord Monbodo; and lastly, my grandfather Barclay, whose residence was at Urie, the home of our venerated ancestor, Robert Barclay, the Apologist. He generally came to us twice a year, when he attended or returned from Parliament. He was member for Kincardineshire. Of all the pleasures of my childhood, by far the greatest and the sweetest in recollection were the visits, whether of the days or weeks, to my dear grandfather at Dudson. I can hardly say how delightful to me was the quiet, the spirit of love and order and peace, which characterised his household. The family, as I remember it, consisted of my grandfather himself and of Lizzie Forster. She had formerly superintended the education of my aunts, my father's sisters, but after the death of my grandmother and my aunts, Lizzie Forster continued her post as head of the establishment. My grandfather himself presented so striking a likeness to William Penn in West's picture of the Treaty with Indians, that I never knew any person who had seen both who was not struck by it. He was very cheerful, orderly, active, acute as a man of business, and most kindly in his consideration and thought for the welfare and happiness of all about him. Whilst my mother bestowed out of her benevolent heart like a noble benefactress, my grandfather gave in a benevo-

lent, considerate, and business-like way; with brotherly kindness he ascertained what would add to the well-being of his people, and supplied the want kindly, beneficently, yet not lavishly, with a completeness that showed his pleasure in giving, yet with an orderly economy. He considered himself as a responsible steward, and as his fortune had been the fruit of God's blessing on industry, he desired, remembering the labor of his youth, to reward industry in others, and to make as many hearts as he could light and grateful to God the Giver, never, seeking to fix the eye of the receiver on himself.

"Lizzie Forster was, like my grandfather, truly a Friend in appearance and in principle. She was a person of excellent understanding, high principle, the kindest heart, distinguished for sagacious observation and keen wit, steadfast and self possessed. She held that place of high respect, in my grandfather's establishment and amongst his friends, which those always will hold who act firmly upon the love and fear of God, and whose bearing reaches the inward testimony in the heart of the beholder; that in nothing do they come forward from self-will, and in nothing do they hold back or compromise the divine teaching; and that neither deluded by their own voice nor that of others, they know and sedulously follow the voice of the Good Shepherd.

"Lizzie Forster was also eminent for a tact and prudence, which gave her an exquisite sense what to do and what to leave undone, what to regulate and what to leave uninterfered with, in the family in which her lot was cast, but to which she was not united by blood. I ever respected and loved her; length of years and experience have only added to my high veneration for her memory.

"All the servants at Dudson, from the butler down to the humblest labourer in the garden, seemed to partake of the influence of the heads of the household. All the habits, all the pursuits and conversation, were tintured by kindliness and usefulness; and the spirit of quietude and love which reigned there, was a delightful rest after the intellectuality, the brilliance, and the constant mental stimulus of Barr.

"Well do I recollect my dear grandfather's cheerful voice, as, at about six o'clock, on a bright summer morning, he would call me to accompany him in his early walk, or, if he were suffering from the gout, to walk by his wheel-chair round the shrubbery. First, we used to visit the little garden he had given me, and watch the growth of the seeds or roots I had planted there under his direction. Then we proceeded to the hot-house or conservatories, where my grandfather affixed to various bunches of grapes or pines the names of invalid friends or others, to whom they might be a comfort. If I had been a good child, he would let me affix the tickets, and would teach me to print the names on them, or perhaps allow

me to be the bearer of some of his gifts. And then he liked to visit his bees in their glass hives, whence he drew many a lesson on industry. He was likewise a great florist, and delighted to visit his greenhouse, his auriculas, or other choice flowers. Then we proceeded to the pond, or rather, perhaps, lake, since the stream on which Birmingham stands runs through it. This lake occupied eight or ten acres, and was of a considerable length. It was truly beautiful; its borders indented, and clothed with the finest willows and poplars I ever saw. The stillness was delightful, interrupted only by some sparkling leaping fish, or the swallow skimming in circles over the water, the hissing of the swans from their two woody islets, or the cries of the wild fowl from the far-off sedges and bulrushes. It used to be a delight to me, when standing near my grandfather in a rustic fishing-house at the farthest end of the pool, he applied to his lips a little silver whistle (such as now, sixty-six years after, I wear in remembrance of him), and immediately the surface of the lake seemed instinct with life. Water fowl of all descriptions rose from their coverts, and hurried towards us; the heavy Muscovy ducks, sheldrakes, Burrow-ducks, from the Severn, sea-gulls, Canada and Cape and tall Peruvian geese, and the little moor-hen and teal, half-sailing, half-flying, with six majestic swans, all drew near to be fed. How well do I remember my grandfather then saying to me, 'Thou canst not do much good, and canst feed but a very few animals; yet how pleasant it is to do even that! God, the Father of all, opens His hand, and all his creatures on the face of the wide earth are filled with good. How blessed is He!'

"Then my grandfather would visit his mill, which was near the lake; there he inquired after all his workmen, went to the cottages of any that were ill, and was sure to leave some substantial evidence of his visit, besides the kind word which accompanied all his gifts. Pleasant were his friendly calls on some infirm or aged person, or sickly child, and sure were those who diligently attended his school of a reward.

"On our return to breakfast, my grandfather would make me partake of his little ration of toast and clotted cream, and then came the pleasure of throwing open the window, and spreading corn with salt on the large pigeon board. How I enjoyed the sudden flight of almond tumblers, Jacobins, pouter, carrier pigeons, and doves, with many other sorts, and to hear their busy beaks on the board, making what I used to call 'pigeons' hail?' How eagerly I listened when my grandfather pointed out to me the deep attachment of the carrier pigeon to her home, of the queest to her nest, of the turtle-dove to her mate; that they could only flourish upon corn, and all their food seasoned with salt! He also showed me their beautiful but sober plumage, and pointed out, when

they soared up aloft, how bright their iridescent colours appeared in the sun. I loved to learn all these particulars concerning the Columbidæ in my childhood, but how many years after was it, when in a different phase of mind, and under a different teaching, I felt the force and beauty of the Christian symbol, that pure and holy dove-like spirit which wanders not from its home,—the heart of her Lord,—and can never be separated in affection from him to whom her heart is consecrated: who feeds on the living bread, the corn of the kingdom, whose thirst can be assuaged only by the living waters, and whose food is seasoned with salt; and, finally, whose external garb and bearing, modest, sober, and unobtrusive, is yet radiant with a heavenly light, caught from a beam of that Sun of righteousness in whom her heart delights. My grandfather only told me the facts of natural history; but I have thought, in long after years, that he had a deeper meaning, whilst he waited till the word and Spirit of God might itself explain the living truth to my heart; and oh! how often have I blessed him for it!

"It was a great pleasure to me, at my grandfather's, to listen to Lizzie Forster as she read aloud the lives of good men, or the accounts of the efforts made for abolishing slavery; and many a word of life, which they perhaps little thought I heeded, dropped like a seed, which, though long buried, sprang up in after years in my soul.

"I loved, too, to assist my grandfather in arranging old letters and papers from friends of his youth or of his ancestors. Many of these old letters were so worn with time that they scarcely hung together and my grandfather often read me some of their contents. I can well recall the feeling of awe with which I touched these papers, and looked upon the very handwriting and familiar expressions of daily life of those who had so long slept in the grave. I felt they were my relations, my own flesh and blood; they were once mirthful and cheerful, and talked as we talk, and now where are they? Where we shall soon be. Who will look over our letters, as we look over theirs? Will our souls be with God in happiness, or shall we be blotted out? And will the letters we leave behind speak a blessing or a curse from the dead to the living? These feelings sunk deeply into my mind.

"One more anecdote respecting my grandfather. He was most kind to us, his grandchildren, but I believe yet more especially to me, who was three years and a half older than any one of the others, and who from delicate health always preferred the quiet society of those older than myself, to children's play. It was his custom to give each of his grandchildren a guinea on the day of their birth, and on every birthday to add another, paying us also interest on the former. When we were seven years old he made us begin

to keep the account ourselves. This was to go on till each attained the age of twenty-one, when he intended the whole sum as a little present; besides this, he frequently gave me money, sometimes half-a-crown, sometimes a guinea. He gave me also a little account-book in which he desired I should accurately set down everything I received and expended. This was contrary to my natural taste and habits. It was also very different from my dear mother's magnificent manner of spending and acting in all that related to money; but one day my grandfather called me to him and said: 'My child, thou didst not like when I advised thee the other day to save thy sixpence, instead of spending it in barberry drops and burnt almonds. But dost thou remember that the beautiful flowers in thy garden, so sweet and so bright, all grow from those ugly brown roots thou wert so busy planting, and that it was so much trouble to weed and to water? And so the bright pleasure of being generous can in like manner only grow from the homely root of self-denial. Dost thou remember too, the Black and the cocoa-nut?' This alluded to the following incident? I had often heard of cocoa-nuts, and read descriptions of them, growing in the country of the Blacks, from the beautiful cocoa-nut palm; and I had been told that the pulp and the milk were delicious, and the husk good to make cordage, and the shell would make a beautiful cup. It had long been the object of my ambition to possess a cocoa-nut. When I was five years old my grandfather, to my great joy, brought me a magnificent one from Liverpool. I had set my heart upon making a little feast for the whole family, myself included, with its contents, and in my mind's eye I already saw its shell turned into a cup. Just at this time a gentlemen's servant, a Black, came to our house with his master, a West India captain. I had never seen a Black before, was frightened, and called him 'ramoneur,' thinking he was a chimney-sweeper; but on its being explained to me that he was a negro, that he had been kid-napped from his country, and taken from his family and friends, and brought away and sold for a slave in Jamaica, and that he could never see his country more, I immediately ran for my cocoa-nut and gave it to him, saying: 'This is from your country; it is all I have to give you, but take it and welcome.' The servant was ever after very kind to me, and I remembered the pleasure I had in giving the cocoa-nut was very much greater than I could have had in eating it and making a cup of it. 'Thus,' my grandfather said, 'thou seest the best pleasures arise from self-denial; we cannot be self-denying wisely till we know the real value of what we give up; that is why I wish thee to keep exact accounts.'

"My grandfather's household was a strictly friendly one, and there were some about him very

anxious to train me in the habits of Friends. One of these persons sometimes said to me; 'See how beautiful are the sober and unobtrusive colors of the linnets, of the dove, and the red-breast. I hope thou wilt imitate them in thy attire,' I would answer: 'But art thou not glad, though, that it pleased God not to create grandpapa's peacocks and golden pheasants on Friends' principles?' Nevertheless, I was deeply attached to Friends. It was one of my greatest pleasures to be taken to the Friends' meeting, either on the Sunday or week days, and scarcely knowing it, I felt the influence of that holy presence of God, visibly recognised by so many persons whose garb marked them as withdrawn from the world, and whose countenances for the most part bore the impress of love and peace. I felt as one entering an overshadowing summer cloud, where the presence of light is felt, though no distinct object is seen; and I well remember after my own childish 'meeting' was over, as I used to watch the progress of the sunbeam as it successively illuminated the countenances of those on the benches before me, how often did I say to myself; 'Oh, that a ray of light from God like that sunbeam would come to me and teach me truly to know Him!' And if this was not vouchsafed to me at that time, yet never can I sufficiently express my deep obligations to the Friends I met with at my grandfather's. They did not indeed bring forward dogmatic truth, as I have heard so many do since; possibly there was not enough of this; but still further were they removed from the irreverent habit of bandying about the most sacred truths as subjects of superficial and colloquial discussion. Deep and reverent was their feeling that the truth of God can only be taught by the Spirit of God: hence they lived the truth instead of talking about it. Their habitual recollection, if it did not announce the dogma, inspired a living sense of the Divine omnipresence and omniscience. Their chastened language and voice, and peaceful placidity of manner, spoke a sense of their accountability to that Supreme Power in whom they confided. The caution and guardedness, and yet definite correctness, with which they declared their sentiments, bore with it an impress of a humble consciousness of fallibility, and a feeling of the preciousness of truth. Their seasons of silence seemed to utter, with a silent tongue, 'Acquaint thyself with God and be at peace.' The indefatigable industry and zeal with which they pursued plans of benevolence told that their hearts recognised that God had indeed made of one blood all the children of men."

TO CURE THE APPETITE FOR TOBACCO.

A man who for many years was addicted to the chewing and smoking of tobacco, but who has entirely abstained from the weed for over thirty years, communicates to *The Independent*

the method of cure which he adopted. We copy it, hoping it will prove effectual in many other cases :

"I had a deep well of very cold water ; and whenever the evil appetite craved indulgence, I resorted immediately to fresh drawn water. Of this I drank what I desired, and then continued to hold water in my mouth, throwing out and taking in successive mouthfuls, until the craving ceased. By a faithful adherence to this practice for about a month, I was cured ; and from that time to this have been as free from any appetite for tobacco as a nursing infant. I loathe the use of the weed in every form, far more than I did before I contracted habit of indulgence."

THE OVER HEART.

BY JOHN G. WHITTIER.

*For Him, and through Him, and to Him are all things,
to whom be glory forever!—Paul.*

Above, below, in sky and sod,
In leaf and spar, in star and man,
Well might the aged Athenian scan
The geometric signs of God,
The measured order of His plan.

And India's mystics sang aright
Of the One Life pervading all,
One Being's tidal rise and fall
In soul and form, in sound and sight,
Eternal outflow and recall.

God is: and man in guilt and fear
The central fact of nature owns ;
Kneels, trembling, by his altar-stones,
And darkly dreams the ghastly smear
Of blood appeases and atones.

Guilt shapes the terror: deep within
The human heart the secret lies
Of all the hideous deities ;
And, painted on a ground of sir,
The fabled gods of torment rise !

And what is He? The white grain nods,
The sweet dews fall, the sweet flowers blow,
But darker signs His presence show ;
The earthquake and the storm are God's,
And good and evil interflow.

Oh, hearts of love! Oh, souls that turn
Like sunflowers to the pure and blest!
To you the truth is manifest ;
For they the mind of Christ discern
Who lean like John upon his breast !

In Him of whom the Sybil told,
For whom the prophet's harp was toned,
Whose need the sage and magian owned,
The loving heart of God behold,
The hope for which the ages groaned !

Fade pomp of dreadful imagery,
Wherewith mankind have defied
Their hate and selfishness and pride!
Let the scared dreamer wake to see
The Christ of Nazareth at his side !

What doth that holy Guide require?
No rite of pain, nor gift of blood,
But, man a kindly brotherhood,
Looking, where duty is desire,
To Him, the beautiful and good.

Gone be the faithlessness of fear ;
And let the pitying heaven's sweet rain
Wash out the altar's bloody stain,
The law of hatred disappear,
The law of love alone remain.

How fall the idols false and grim!
And lo! their hideous wreck above
The emblems of the Lamb and Dove!
Man turns from God, not God from him,
And guilt, in suffering, whispers love!

The world sits at the feet of Christ
Unknowing, blind, and unconsoled ;
It yet shall touch His garment's fold,
And feel the heavenly Alchemist
Transform its very dust to gold.

The theme befitting angel tongues
Beyond a mortal scope has grown,
Oh heart of mine! with reverence own
The fulness which to it belongs,
And trust the unknown for the known!

"BE FIRM AND TRUE."

BY J. HUNT, JR.

Be this thy duty, friend, through life,
To hoard the good with "miser care,"
And in the stern, contested strife,
Undaunted stand, and not despair.

He who continues firm and true,
And holds his passion under ban—
Whose soul abhors and scorns to do
A wanton wrong to any man!

And feels that he himself is bound,
By all the ties existence cheers,
To aid, support, where'er is found,
The needy in this "vale of tears:"

Will, by our God—as bards have sung—
Be deemed the wealth of earth above,
And ranked in heaven as rare, among
The treasured jewels of His love.

THE TRUTH DOTHT NEVER DIE.

Though Kingdoms, States, and Empires fall,
And dynasties decay ;
Though cities crumble into dust,
And nations die away ;
Though gorgeous towers and palaces
In heaps of ruin lie,
Which once were proudest of the proud,
The truth doth never die !

We'll mourn not o'er the silent past ;
Its glories are not fled,
Although its men of high renown
Be numbered with the dead.
We'll grieve not o'er what earth has lost,
It cannot claim a sigh ;
For the wrong alone hath perished,
The Truth doth never die !

All of the Past is living still—
All that is good and true ;
The rest hath perished, and it did
Deserve to perish, too!
The world rolls ever round and round,
And time rolls ever by ;
And the wrong is ever rooted up,
But the Truth doth never die !

For Friends' Intelligencer.

WAR.

It is impossible to estimate the vast amount of suffering and destitution entailed upon millions of our race, by the war that is now occupying the powers of Europe. We, who hear the distant rumor of the conflict, and oftentimes only the eclat of the victorious party, may lose sight of the dreadful carnage and sickening horrors attendant upon the battle field, but it is nevertheless a scene revolting to every feeling of our better nature and altogether at enmity with the precepts of our holy Pattern.

One, whom we would not cite as authority upon many subjects, has recorded that the crime and misery, the idleness and debauchery introduced into a country during a single campaign, equals or exceeds the vice encountered, under ordinary circumstances, in three centuries.

Walter Scott admits that the battle of Waterloo created fifteen thousand widows, and a late account considers it probable that twenty thousand widows and sixty thousand orphans were created by the recent battle of Magenta.

In the sixteen years intervening between 1799 and 1815, the French army absorbed four million five hundred and fifty six thousand men. Of a million and a quarter raised by conscription for Napoleon's army in 1813, only one hundred thousand remained alive the following year 1814.

It appears from official statements recently made, that the military forces of Europe now embrace four million two hundred and forty-six thousand two hundred and ninety two soldiers under arms, exclusive of "sailors, guards, civil, national or militia." Only think of it! a population equal to one seventh of our entire republic, whose professional business is murder and bloodshed. Trained and paid by taxation of enlightened Christian nations, by stratagem or open warfare, to slaughter and butcher their brethren, without provocation and without animosity, to gratify the selfish aims of ambitious partisans. We assert, and believe it to be undeniably a truth, that war under all circumstances is *wrong*, and at variance with the teachings of the meek and lowly Jesus, who declared that "all they that take the sword shall perish with the sword," and "my kingdom is not of this world; if my kingdom were of this world, then would my servants fight." If this be admitted, how important is it to turn the attention of the mind from the pomp and circumstances of war to a calm recognition of its true character.

Oh, ye teachers! to whom is entrusted so much of the training of the youthful mind, when in their text books they read of some "brilliant" sanguinary struggle, and their enthusiastic imaginations are dazzled with the glory of the "splendid achievement," are you careful to divest the fascinating and dangerous recital of its false glare, and to teach those who are looking

to you for instruction, that greater "is he that ruleth his spirit than he that taketh a city!"

When the history records a lengthy and graphic account of a spirited naval engagement, do you tell them the particulars are unnecessary, and teach them to omit them.

When they read that "the troops were the third time reluctantly led on to the charge," and their opponents were commanded "not to fire till they could see the pupils in the eyes of the enemy," do you show then such scenes are worse than brutal, and never were and never can be entitled to admiration, and that

"One self approving hour, whole years outweighs,
Of stupid starers and of loud buzzas."

Do you explain to their unformed judgments, that the expression "our glorious revolution," is, literally translated, eight years of privation and suffering, during which were sacrificed three hundred thousand of our ancestors?

Would I could present this subject so clearly to you who are devoting your time and energies to the responsible and interesting occupation of teaching, that you would be constrained to use every influence over the minds of those, whom I believe you are conscientiously endeavoring to instruct, to remove the false investitures from this unrighteous idol.

Do not be discouraged because your text books are not unexceptionable. Children readily sympathize with those they love and respect, and correct views constantly presented must make an impression; at all events, *do what you can*.

H.

7th mo. 19th, 1859.

TRAVEL FROM AND TO PHILADELPHIA THIRTY-FIVE YEARS AGO.

In 1824 the summer route of travel to Baltimore was by the Union line of steamboats and packets, from No. 6 South Wharves. The Steamboat left this city every day at 12 o'clock, and going by the way of New Castle and Frenchtown the passengers reached Baltimore early the next morning. When the navigation was obstructed, the route by stage was through Chester, Wilmington, Elkton, and Havre de Grace, leaving Philadelphia at 7½ o'clock, A. M., and arriving in Baltimore at 4 A. M., the following day. The New York United States Mail line by the way of Trenton, Princeton, and New Brunswick, left the office No. 30 south Third st. at 3 o'clock, P. M. daily. The summer route through Bordentown and Washington, left Market St., wharf by steamboat daily at 6 o'clock A. M., and arrived at the same hour. The winter route, by coach, was through Bristol, Trenton, Princeton, and New Brunswick. The New York Union line of steamboats left daily at 6 o'clock A. M., and 12 M., the route being through Trenton, Princeton, and New Brun-

wick; the New York Columbian Line of steam-boats left at 6 A. M., and 6 P. M., going through Bordentown and Washington. Another line known as the "New York New Line" by steamboats, left daily at 12 M., returning at 10 A. M., the route being through Bordentown, Princeton and New Brunswick. The Lancaster and Pittsburg stages left the Western Hotel, at 4 o'clock A. M., daily, the route being through Harrisburg and Chambersburg. Passengers by this line had to rise early, but early rising was more fashionable then than now. The stages for Bethlehem left the office in Race street above Third, three times a week. Frankford stage left twice a day; Downingtown stages three times a week; Bridgeton left daily at sunrise; Germantown and Chestnut Hill, twice a day; Great Egg Harbor Mail stage, once a week; Haddonfield stage, daily; Mount Holly stage, daily. Besides the above there were many stages running to many towns in the interior of Pennsylvania, Norristown, Reading, &c. Thirty-five years has made a marked change in mode and speed of inland travel. The traveller who left Philadelphia for New York, by the mail line, at 3 o'clock P. M., and by a change of horses at numerous stations, reached that city in time for dinner next day, after riding all night, may now breakfast in Philadelphia, dine in New York, and take his supper here, and have two or three hours to spare for business. The towns contiguous to the city, which could be reached twice a day, may now be travelled to every fifteen minutes or half hour, and to Frankford without the use of steam.—*Public Ledger.*

HOW THE INDIANS MADE STONE ARROW HEADS.

The heads of Indian arrows, spears, javelins, &c., often found in many parts of our continent, have been admired, but the process of forming them conjectured. The Hon. Caleb Lyon, on a recent visit to California, met with a party of Shasta Indians, and ascertained that they still used those weapons, which in most tribes have been superseded by rifles, or at least by iron-pointed arrows and spears. He found a man who could manufacture them, and saw him at work at all parts of the process. The description which Lyon wrote and communicated to the American Ethnological Society, through Dr. E. H. Davis, we copy below:

The Shasta Indian seated himself upon the floor, and laying the stone anvil upon his knee, which was of compact talcose slate, with one blow of his agate chisel he separated the obsidian pebble into two parts, then giving another blow to the fractured side he split off a slab some fourth of an inch in thickness. Holding the piece against the anvil with the thumb and finger of his left hand, he commenced a series of continous blows every one of which chipped off

fragments of the brittle substance. It gradually assumed the required shape. After finishing the base of the arrow-head (the whole being only little over an inch in length) he began striking gentler blows, every one of which I expected would break it in pieces. Yet such was their adroit application, his skill and dexterity, that in little over an hour he produced a complete obsidian arrow head. I then requested him to carve me one from the remains of a broken porter bottle which (after two failures) he succeeded in doing. He gave as a reason for his ill success, he did not understand the grain of the glass. No sculptor ever handled a chisel with greater precision, or more carefully measured the weight and effect of every blow than this ingenious Indian, for even among them, arrow-making is a distinct trade or profession, which many attempted but in which few attain excellence. He understood the capacity of the material he wrought, and before striking the first blow, by surveying the pebble, he could judge of its availability as well as the sculptor judges of the perfectness of a block of Parian. In a moment, all that I had read upon this subject, written by learned and speculative antiquarians of the hardening of copper, for the working of flint axes, spears, chisels and arrow heads, vanished before the simplest mechanical process. I felt that the world had been better served had they driven the pen less, and the plow more!

CAOUTCHOUC CARRIAGE WHEELS.

It is proposed by means of an improved method, to substitute caoutchouc tyres for wheels, instead of iron, as at present. This form of carriage wheel tyre has in various forms been before the public for a number of years, but the great difficulty in applying them was found to be in fixing them on the wheels. This difficulty according to a more recent mode, has been overcome, by forming the tyres with an elongated inner rib, which is held in a recess in the rim of the wheel, and tightly squeezed up. The first attempt to introduce elastic tyres consisted in using tubes of compressed air, formed of India rubber, and these were found to give an exceedingly smooth motion on the roughest road, but were liable to accidents of a rather awkward nature—they occasionally exploded with quite a startling report. An endeavor was made to form an India rubber tyre with a combination of strong canvass web made up with it in concentric layers, as in the strong India rubber hose used for fire engines, &c.; it was found, however, that although a tyre thus constructed was more easily retained on the wheel the canvass and rubber began to separate from each, by the internal working of the tyre when subjected to hard work on the road. It is thought however, that there is no difficulty of this kind which may not in time be overcome.

THE BEAUTY OF THE HEAVENS.

How delightful it is to contemplate the heavens! They are "stretched out as a curtain to dwell in!" Not only as far as the human eye can see, but beyond the remotest boundary which the highest telescopic powers can reach, does the ethereal firmament extend! We can find no limit, no boundary. Millions of miles may be traversed from any given point of space, and still the heavens appear illimitable. Infinity is stamped upon them. And with what gorgeous splendor and magnificence is that curtain adorned! In every direction it is studded with worlds, suns and systems, all harmoniously moving in perfect and undeviating obedience to the Almighty will. The soul in such a contemplation is absorbed. Earth ceases to hold us with its silver chain. The mind, set free from grovelling pursuits, mounts up, as on the wings of an eagle, and soars away through immensity of space, surveying and admiring the innumerable revolving orbs, which like so many "crowns of glory" and "diadems of beauty," bespangle that firmament "whose antiquity is of ancient days," and which so powerfully attest that "the hand that mad them is divine!"

The immense distance of the fixed stars claims our attention, and awakens the most enrapturing feelings in the mind. Reason is compelled to give the reins to imagination, which tells us there are stars so distant that their light has been shining since the creation, and yet, amazingly rapid as light travels, no ray from them has yet reached us!

ITEMS OF NEWS.

PEACE CONCLUDED BETWEEN FRANCE AND AUSTRIA.—The North Briton brings the important intelligence that the war between France and Austria is over, that a peace has been concluded by which France hands Lombardy over to the King of Sardinia, Austria retains her control of Venice, and the other Italian States are to be leagued together in a confederacy with the Pope to preside over them, Venice having the privilege also of being in the confederation, though under the rule of Austria.

SLAVE TRADE.—The Washington *Star* denies the report that sixty or seventy cargoes of African negroes have been landed in the United States since the successful voyage of the *Wanderer*. It adds, however, that the parties in the South, interested in the revival of the trade, are doing their best to embarrass the action of the Government officers charged with the duty of guarding the coasts.

ENGLISH NEWS.—A deputation from the Atlantic Steamship Company (Galway line) had waited on the Chancellor of the Exchequer to urge sundry improvements at Galway harbor.

It was announced that the Atlantic Telegraph Company obtain the cooperation of Robert Stephenson, Professor Wheatstone and Thompson, who, with Mr. Varley, consulting electrician of the Company, and other scientific individuals, will form a committee to investigate and advise as to the construction of the next cable.

Mr. Seward, Secretary of the Atlantic Telegraph Company, publishes letters contradictory of the absurd

rumor that the cable had never been in perfect operation. He shows that there were actually transmitted a total of three hundred and sixty-six messages or thirty-nine hundred and forty words.

In the British Parliament there are sixty members who are over sixty years of age.

JAPAN.—There appears to be considerable doubt if the proposed Japanese embassy to the United States will take place. The *North China Herald* says: "The conservative party, who are opposed to all innovations, are determined to prevent this infraction of the law which prohibits Japanese leaving their country. The two delegates who have been named for Washington are themselves anxious to go, but their departure will certainly be delayed, for the present at least. A council for foreign affairs has been established at Jeddo, consisting of five princes. The ambassadors for Great Britain are not yet nominated."

MOORE WILD AFRICANS.—The *Mobile Mercury*, which is good authority for such information, states that recently another cargo of wild Africans was landed in the South, and sold. We have no doubt that this infamous trade is carried on by our "Southern brethren," which can now be done with impunity, as no jury there will convict the pirates engaged in it.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is still exceedingly quiet. The receipts are small but the stock is ample. Old stock superfine is held at \$5 a 5 25 per barrel and fresh ground from new Wheat at \$5 50 a 6 2; there is no inquiry for the former, and buyers refuse the highest quotation for the latter. The sales to the trade range from \$5 00 to \$5 25 for superfine and from \$5 75 up to 7 50 for extras and extra family, according to freshness and quality. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 00 and the latter at \$3 75 per barrel.

GRAIN.—There is a light demand for new Wheat, and prices are again still very weak. Sales of 5200 bushels prime new red at \$1 18 a \$1 22, and choice white at \$1 27 a 1 31 per bushel. Rye is dull at 81 cents. Corn is in limited supply, but there is very little demand for it. Small sales of yellow at 79 a 81c. Oats are dull; small sales of Pennsylvania at 39c per bushel for old, and 38 cents for Delaware.

CLOVERSEED comes forward slowly. Sales of fair and good quality at \$5 50 a \$5 75 per 64 lbs. Timothy, if here, would readily command \$2 50. Flaxseed is worth \$1 60 a 1 70 per bushel.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 12 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Penciling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, EIGHTH MONTH 6, 1859.

No. 21.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

(Continued from page 306.)

On Salvation by Christ.

John. What I mean by the doctrine of atonement, is a belief in the *vicarious sufferings* of Jesus Christ, when he suffered death without the gates of Jerusalem, as a *substitute* for the whole human race, in order to satisfy the offended justice of God, and to render him propitious to guilty man. Adam, and all his posterity, having broken the law of God, it would have been necessary for the whole human race to have suffered eternal death, in order to satisfy the infinite justice of God; but the Son of God offered himself as a substitute for man, and agreed to pay the price of our redemption, by taking on him a human body, and suffering the pains of death.

Father. As I said on a former occasion, those who profess to derive their doctrines entirely from the scriptures, ought to be very careful to adhere strictly to the text. Now we find no such language in the scriptures, as the *vicarious sufferings* of Jesus Christ; nor do they say that he died as a *substitute* for guilty man; nor is there any language in them, from which such a conclusion can be fairly drawn. To punish the innocent, in order that the guilty may go free, is entirely inconsistent with the justice and mercy of the Divine character. "He that justifieth the wicked, and he that condemneth the just, even they both are abomination to the Lord." Prov. xvii. 15. It is said in the scriptures, that Christ died for all men; but there is not the slightest intimation that his sufferings were intended to appease the wrath, or satisfy the justice of God.

The object of his mission was to bear witness to the truth. "To this end was I born," said he, "and for this cause came I into the world, that I should bear witness unto the truth." John xviii. 37. But he could not bear witness to the truth, among that perverse and wicked generation, without exposing himself to sufferings and death; and he therefore voluntarily offered himself to die for the salvation of mankind. His death did not change the feelings nor the purposes of God towards mankind; for God is altogether unchangeable. "In him is neither variableness nor shadow of turning:" and he is always "kind, even to the unthankful and to the evil."

The mission of Jesus Christ was itself the effect of God's unchanging love to man; for all the good that he did, was done by the power of God operating through him. "I can of myself do nothing," said he; "my Father that dwelleth in me, he doeth the works." "God was in Christ, reconciling the world unto himself, not imputing their trespasses unto them, and hath committed unto us the word of reconciliation. Now then, we are ambassadors for Christ," says the apostle, "as though God did beseech you by us; we pray you in Christ's stead, be ye reconciled to God." 2 Cor. v. 19, 20. There is not a word said in the scriptures, about God being *reconciled* to man by the death of his Son; but it is man that must be reconciled to God; for he has always loved mankind: but man being at enmity with him, it is in *man* that the change *must* be wrought, and the reconciliation effected. One means which the Divine Being has made use of, in all ages of the world, to change the hearts of wicked men, has been the patience, the resignation, and the joy with which his faithful servants have suffered for his cause, when persecuted by the wicked. It was in this way that Jesus Christ and his apostles bore their testimony to the truth, and exemplified before men the goodness, the purity, and the love of that Divine Power, whose kingdom was established within them. It was in this way, too, that the primitive Christians, though generally poor, illiterate, and despised among men, were made the instruments of convincing mankind, and enlarging the Redeemer's kingdom. And if the kingdoms of this world shall ever "become the kingdoms of God and of his Christ," (as I believe they will,) it must be effected by the holy living, the meek example, and the patient sufferings of the faithful. I can conceive of no

other means so well calculated to touch the feelings and to convince the judgment, as the example of one who is actuated by the love of God in all things, and who is willing to "lay down his life for the brethren," and for the testimony of truth.

We find that the holy living, the powerful preaching and the numerous miracles of Jesus, made but few converts, until he "laid down his life for the sheep," and sealed his testimony with his blood. It was then that many began to perceive that "his kingdom was not of this world, else would his servants fight." They were convinced that he had been actuated by Divine love in all that he did: and when the apostles, who were filled with the Holy Spirit, began to preach to the multitude, and showed them that "God had made that same Jesus whom they had crucified, both Lord and Christ," then they were pricked in their hearts, and said unto Peter and to the rest of the apostles, men and brethren, what shall we do?" Acts ii. 36, 37. And "the same day there were added unto them about three thousand souls." ver. 41.

Thus we see how the sufferings of the Messiah operated upon the people of that day, to reconcile them to God; but it is the life and power of God that dwelt in Christ, which *saves* from sin: "for if, when we were enemies," says the apostle Paul, "we were reconciled to God by the death of his Son, much more, being reconciled, we shall be saved by his life." Rom. v. 10. For "in him was life, and the life was the light of men." John i. 4. It is this life of God, or "Spirit of truth" revealed in the soul, which purifies and saves from sin. This life is sometimes spoken of as the blood; for according to the Jewish law "the blood is the life." (Levit. xvii. 11, 14,—Gen. ix. 4,—Deuter. xii. 23.) And when Jesus told the people, "Except ye eat the flesh of the Son of man, and drink his blood, ye have no life in you;" he did not allude to the flesh and blood of his outward body, but to the life and power of God which dwelt in him, and spake through him. In confirmation of this view, he said himself to his disciples, by way of explanation, "It is the Spirit which quickeneth; the flesh profiteth nothing: the words that I speak unto you, they are spirit, and they are life." John vi. 53, 63.

When the apostle John saw, in the Revelations, "a great multitude which no man could number, of all nations, and kindreds, and people, and tongues, who stood before the throne and before the Lamb, clothed with white robes, and palms in their hands," he was told, that these were they who had "come out of great tribulation," who had "washed their robes, and made them white in the blood of the Lamb." Rev. vii. 9, 14. Now, we cannot suppose that these robes were made of earthly materials; nor will any one contend that the blood with which they were

washed and *made white*, was the outward blood, shed upon mount Calvary. They were spiritual garments, and the blood too was spiritual; it was the life or spirit of God which dwelt in Jesus; and it is by this only that our hearts can be "sprinkled from an evil conscience." For "if the blood of bulls and of goats, and the ashes of an heifer, sprinkling the unclean, sanctifieth to the purifying of the flesh; how much more shall the blood of Christ, who, through the eternal Spirit, offered himself without spot to God, purge your conscience from dead works to serve the living God?" Heb. ix. 13, 14. It appears very evident to me, that nothing of an outward character can purge the conscience, or purify the mind; for these are spiritual, and require spiritual agents to act upon them.

John. It appears to me that in this last quotation the apostle alludes to the Jewish sacrifices of bulls and of goats, as being the types of that great sacrifice which Christ was to make of himself once for all. The sacrifice of the scape-goat, once in the year, on the day of solemn expiation for the sins of the whole people, is generally considered a striking type of the sacrifice of Christ, which it was intended to prefigure. Two goats were brought to the door of the tabernacle for a sin-offering, and the high priest cast lots upon them, which should be sacrificed to the Lord and which should be set at liberty. One of them was then put to death for a sin-offering for all the people, his blood was sprinkled upon the altar, and his body was burnt without the camp. The other goat was the scape-goat, on which the high priest laid his hands, confessing his sins and the sins of all the people; he then sent him into the wilderness, to a place not inhabited, to be there set at liberty, and to bear the iniquities of the people. The first of these goats is supposed to have been intended to prefigure the death of Christ; and the second, which was saved alive, to typify his resurrection.

Father. We are not informed in any part of the scriptures, that these goats were intended as types of Jesus Christ, and I can see no reason for such a conclusion. There are, however, several reasons which have convinced me that they had no such meaning. In the first place, the goat was never made use of as an emblem of purity or holiness; but, on the contrary, always as an emblem of sin: for our Saviour himself spoke of it in this way, when he said he would place the sheep on his right hand, and the goats (that is, the wicked) on his left. 2. The Messiah is spoken of under the figure of a lamb; and it is not possible that he could be typified by two natures so entirely opposite as the lamb and the goat. 3. It appears to me that these sacrifices were figures of spiritual things, and that the holy men of old understood them in that light; for we find that the more enlightened they

became, the less reliance they placed upon these outward ceremonies.

The prophet Samuel said to Saul, "Hath the Lord as great delight in burnt-offerings and sacrifices, as in obeying the voice of the Lord? Behold, to obey is better than sacrifice, and to hearken than the fat of rams." 1 Sam. xv. 22. The prophet Isaiah told the people that the Lord had no pleasure in their sacrifices, because their "hands were full of blood," and he exhorts them, in the name of the Most High, to put away the evil of their doings.—"Cease to do evil, learn to do well; seek judgment, relieve the oppressed; judge the fatherless, plead for the widow. Come now, and let us reason together, saith the Lord; though your sins be as scarlet, they shall be as white as snow; though they be red like crimson they shall be as wool." But the language of Jeremiah is still more decided against placing any dependence upon outward sacrifices. "Thus saith the Lord of hosts, the God of Israel; Put your burnt offerings unto your sacrifices, and eat flesh. For I spake not unto your fathers, nor commanded them in the day that I brought them out of the land of Egypt, concerning burnt offerings or sacrifices: but this thing commanded I them, saying, Obey my voice, and I will be your God and ye shall be my people; and walk in all the ways that I have commanded you, that it may be well with you." Jer. vii. 21-23.

(To be continued.)

Some account of the life and religious experience of RUTH ANNA RUTTER, of Potts-town, Pennsylvania, afterwards RUTH ANNA LINDLEY, wife of JACOB LINDLEY, of Chester county.

WRITTEN BY HERSELF.

I trust it is under a degree of the influence of the blessed Truth, that I now take up my pen, in order to commemorate the tender dealings of an Almighty and most merciful Father towards me, in the morning of my day; that if I am continued in this vale of mortality, to future years, my heart may be reverently bowed in gratitude, in taking a little retrospect thereof.

It pleased my Heavenly Father to incline my heart to seek him, from my infancy; and about the fourteenth year of my age, I was favored with a remarkable visitation, the beginning of which I was thus made sensible of: One day, being much interested in a little piece of work, and confining myself to my chamber, many serious reflections presented themselves. In the evening, sitting in the parlor with my parents, brothers and sisters, I burst into tears; and all leaving the room, except my dear mother, she asked the occasion of my uneasiness. I told her, I was just thinking, if it should please the Almighty to call me, before the light of another day, whether I was in a fit situation to appear before his great Majesty? She spoke suitably to me, and

said, she made no doubt if I sought properly to be rendered worthy an inheritance in the kingdom, I should gain it. But I felt great distress that night; and my concern continued for some time.

One evening, being left alone with my dear mother, and having some desire of improvement, I asked her what books would be suitable for me to read? She answered, "there is none more suitable than the Bible." This reply affected me: and she took that opportunity of querying with me, what society I thought I should join? I told her, I believed I would be a Quaker. Indeed, I saw it clearly to be my duty, to leave off several of my flounces, and superfluous things; and felt peace in giving up thereto: but through unwatchfulness, I lost ground, and became again captivated and ensnared, in the vain fashions and customs of the world. My sister being about to accomplish her marriage, several new things were provided for me, on the occasion. I put on a cushion, and dressed in the most fashionable style, for girls of my age. I joined in all the levity and mirth that was going forward, and was at times much elated. But alas! that innocent and calm serenity of mind, with which I had been favored while I lived in the cross to my natural inclination, was no longer in my possession. Every enjoyment carried with it a sting, and I felt a void which I cannot express; but which, no doubt, proceeded from the absence of my Beloved. Nevertheless, I pursued a gay line of life, till turned of seventeen; though I had often to recur to that season wherein I was favored with religious thoughtfulness, and in secret lamented my situation.

In the fall preceding the change in my dress, my sister invited me to spend the winter with her, in order to introduce me into company. I accordingly went, and frequented the dancing assemblies, theatre and all places of amusement that were usual. I also learned music, having a master to attend me; and made great proficiency therein, as I had a natural ear, and uncommon fondness for it. I promised myself much pleasure, and thought it would fill up many vacant hours which I should have in the country; for, from the sensations that often attended my mind, I thought I should not long continue in the circle I was then in.

Through the course of the winter, I have since thought, I was under a very tender visitation of divine love; though at that time I knew it not. My mind was, at seasons, so absorbed, that when paying formal visits, and surrounded with company, I scarce knew what passed, and but few expressions escaped my lips; so that my friends would often tell me I was extremely silent, and laugh at me for it. And indeed, I was, at times, almost ready to conclude, there was a great degree of insensibility in me, and a natural uneasiness of disposition; for, notwithstanding

ing no exertion of my friends nor expense of my parents were spared, to render every thing agreeable to me, I was not happy. When under the hands of the hair-dresser, tears would stream from my eyes, though I could not tell the cause: but doubtless, it was the cords of thy divine love, O my Beloved! operating in me, in order that I might become wholly thine!

I well remember, one afternoon, being engaged upon a large party, I went up stairs to dress, and sat before the glass, attempting to crape my hair; but not considering what I was about, being in deep thought, it grew late, and I was hurried; and not readily finding some of my finery which I wanted to put on, it fluttered me, and I felt entangled in those things, which gave me much pain and anxiety without knowing where to seek relief. I threw myself on the bed, in great agony of mind, and gave vent to many tears: but after some time I arose, went down stairs, and made excuse to my sister, who expected to see me in full dress. But truly, my mind was not in a fit condition to join a large company; though I strove to hide the real cause. At another time, going with some company to see a pantomime performed, my mind was so abstracted from the objects around me, that I could pay no attention to the scene, but felt a dejection and distress not easily to be conceived.

The last ball I attended was given by some young men of my acquaintance; my sister had a dance the preceding evening at her own house; and I, being much fatigued, wished to have excused myself from going to the ball; but it being a set company, and my friends pressing me to go, I yielded and went; but had not danced more than two or three dances, before I again felt deep distress and dismay to cover my mind. I called my brother, and told him I was not well; desiring him to call one of the servants who were in waiting, to go home with me, as I wished to leave the room unobserved; which he accordingly did; and my sister expressing her surprise at my quick return, I plead indisposition, and went to bed.

Soon after this, I lost an uncle; and he dying suddenly, it greatly shocked and affected me. The next first-day evening, being the time of the Spring meeting, and an evening meeting held at Pine Street, a connexion of mine asked me to go there with her. I had frequently, in the course of the winter, gone in there, when my sister would go on to church (we lived but two doors from the meeting house.) She and her husband would sometimes smile, and tell me they believed I intended to be a Quaker. I did not know it would so soon be the case, but I felt a secret satisfaction in attending their meetings. I generally sat near the door, or in the back part of the house, lest my appearance should attract their attention. In the evening above alluded to, we had not sat long, before a Friend got up

and spoke; and as he was rather tedious, my companion soon got tired and proposed going; but I chose to stay, and she left me. After some time, dear Daniel Offley appeared largely in testimony. He mentioned the prospect he had, of some youth then present having a great work to do; and spoke so clearly to my state that I was much struck with it; but knew not at that time it was intended for me: and thought, how deeply those must feel for whom it was meant.—But although I did not, at that time, take it to myself, I had afterwards cause to remember that solemn testimony, and it was a strength to me.

About the middle of the fourth month, I returned home; and soon after was invited to attend a wedding; and, being again in a very thoughtless state, I was pleased with the thoughts of having the opportunity to display my fine clothes. A few nights before the wedding, I had a dream, which made considerable impression upon my mind; and the next day, sitting with a near connexion, with whom I was very intimate, I related it to her; and told her I believed there would shortly be a death in the family. While we were conversing together, there seemed to be a cloud or mist which overshadowed me, and I felt as if I was raised off the chair. I believe I was at that moment, insensible to every thing around me; my countenance changed; and my cousin, in some surprise, asked me what was the matter. I told her I felt very strange; and burst into a flood of tears. When I a little recovered, I told her, if nothing happened to myself, or in the family, never to mention the situation I had been in. My mind then became very awfully impressed with the thoughts of death and the necessity of being prepared. On the succeeding day I heard of the decease of a little cousin, who died of a short illness; and when we were assembled to attend the burial, two children out of one family were carried by the door, who both died of the same disease. All these things had a tendency deeply and awfully to impress my mind. I seemed in a state of amazement and distress, and was willing to deliver myself up to the Lord, but knew not what step to take: all was dark and gloomy before me. May I never forget the night I passed after that funeral; a thick veil of darkness seemed to cover me, and the terrors of an angry God encompassed me about. A near relation slept with me, who had taken a serious turn some time before; she spoke encouragingly to me, but alas! my mind was not in a fit state to receive it. The next day my parents came home, having been absent some time; I shed abundance of tears, which they, not knowing the real cause, attributed to the deep sympathy I had for my afflicted relations.

The young woman, whose wedding I had been invited to, was married according to appointment; but I felt no disposition to attend the

marriage, being sorely distressed in mind. The day following, I paid her a morning visit, though I scarce knew where I was or what I was about. For six weeks, I experienced a state of deep conflict and exercise. My dress became very burdensome to me, and the fear of not having stability, deterred me from changing it. In the course of that time, I spent a week with some Methodist relations. Their minister came while I was there, and I attended their meeting; with which I was much pleased, my mind being in a very tender state. They also invited me to attend their class-meeting, but I did not feel the same unity with that; however I believed them to be a seeking people, and became greatly attached to them, and thought I should join the society. But after my return home, still feeling some doubts, and not that peace and confirmation, which, above all things, I desired,—at times, when a little strength was afforded, my prayers were put up in secret, that I might be rightly directed. But Oh! I knew not what to do, nor which way to turn myself, for peace of mind.

(To be continued.)

Extracts from *Theologia Germanica*.

ACCOUNT OF THE "FRIENDS OF GOD,"

A PEOPLE OF THE THIRTEENTH CENTURY.

In these chaotic times, and in the countries where the storms raged most fiercely, there were some who sought that peace which could not be found on earth, in intercourse with a higher world. Destitute of help and comfort and guidance from man, they took refuge in God, and finding that to them He had proved "a present helper in time of trouble," as "a shadow of a great rock in a weary land," they tried to bring their fellow men to believe and partake in a life raised above the troubles of this world. They desired to show them that that eternal life and enduring peace which Christ had promised to His disciples, was, of a truth, to be found by the way which he had pointed out, by a living union with Him and the Father who had sent Him.

With this aim, like-minded men and women united themselves together, that by communion of heart and mutual counsel they might strengthen each other in their common efforts to revive the spiritual life of those around them. The association they founded was kept secret, lest through misconception of their principles, they might fall under suspicion of heresy, and the Inquisition should put a stop to their labors; but they desired to keep themselves aloof from everything that savored of heresy or disorder. On the contrary, they carefully observed all the precepts of the Church, and carried their obedience so far that many of their number were among the priests who were banished for obeying the Pope, when the Emperor ordered them to disregard the interdict. They assumed the appellation of

"Friends of God," (*Gottes Freunde*), and in course of a few years, their associations extended along the Rhine-provinces, from Basle to Cologne, and eastward through Swabia, Bavaria and Franconia. Strasburg, Constance, Nuremberg and Nordlingen, were among their chief seats. Their distinguishing doctrines were self-renunciation, the complete giving up of self-will to the will of God; the continuous activity of the spirit of God in all believers, and the intimate union possible between God and man; the worthlessness of all religion based upon fear or the hope of reward, and the essential equality of the laity and clergy, though for the sake of order and discipline, the organization of the Church was necessary. They often appealed to the declaration of Christ, (John xv. 15,) "Henceforth I call you not servants, for the servant knoweth not what his Lord doeth, but I have called you friends, for all things that I have heard of my Father I have made known unto you;" and from this they probably derived their name of "Friends of God."

Their mode of action was simply personal, for they made no attempt to gain political and hierarchical power, but exerted all their influence by means of preaching, writing and social intercourse. The association counted among its members, priests, monks, and laity, without distinction of rank or sex. Its leaders stood likewise in close connection with several convents, especially those of Engenthal, Maria-Medingen, near Nuremberg, presided over by the sisters Christina and Margaret Ebner, much of whose correspondence is still extant. Agnes, the widow of King Andrew of Hungary, and various knights and burghers, are also named as belonging to it.

Foremost among the leaders of this party should be mentioned the celebrated Tauler, a Dominican monk of Strasburg, who spent his life in preaching and teaching up and down the country from Strasburg to Cologne, and whose influence is to this day active among his countrymen by means of his admirable sermons, which are still widely read. At the time of the Interdict, he wrote a noble appeal to the clergy, not to forsake their flocks, maintaining that if the Emperor had sinned, the blame lay upon him only, not with his wretched subjects, so that it was a crying shame to visit his guilt upon the innocent people, but that their unjust oppression would be recompensed to them by God, hereafter. He acted up to his own principles, and when the Black Death was raging in Strasburg, where it carried off 16,000 victims, he was unwearied in his efforts to administer aid and consolation to the sick and dying.

Much of Tauler's religious fervor and light he himself attributed to the instructions of a layman, his friend. It is now known from contemporary records that this was Nicholas of Basle, a citizen of that free town, and a secret Waldensian.

Little is known of his life beyond the fact that he was intimately connected with many of the heads of this party, and was resorted to by them for guidance and help; for being under suspicion of heresy, he had to conceal all his movements from the Inquisition. He succeeded, however, in carrying on his labors and eluding his enemies, until he reached an advanced age, but at length, venturing alone and unprotected into France, he was taken and burnt at Venice in 1382. Another friend of Tauler's, and like him an eloquent and powerful preacher, whose sermons are still read with delight, was Henry Suso a Dominican monk, belonging to a knightly family in Swabia.

One of the leaders of the "Friends of God," Nicholas of Strasburg, was in 1326 appointed by John XXII, nuncio, with the oversight of the Dominican order throughout Germany, and dedicated to that Pope an essay of great learning and ability, refuting the prevalent interpretations of Scripture, which referred the coming of Antichrist and the judgment to the immediate future. Thus we see that the "Friends of God" were not confined to one political party, and this likewise appears from the history of another celebrated member of this sect, Henry of Nordlingen, a priest of Constance, who, like Suso, was banished for his adherence to the Pope. One of the most remarkable men of this sect was a layman, and married, Rulman Merwin, belonging to a high family at Strasburg. He appears to have been led to a religious life by the influence of Tauler, who was his confessor. He is the author of several mystical works, which he says he wrote "to do good to his fellow creatures," but he contributed perhaps still more largely to their benefit by his activity in charitable works, for he established one hospital, and seems to have had the oversight of others also. He likewise gave largely to churches and convents, but is best known by having founded a house for the knights of St. John in Strasburg. The characteristic doctrines of the Friends of God have been already indicated. That they should not have fallen into some exaggerations was scarcely possible, but where they have done so, it may generally be traced to the influence of the monastic life to which most of them were dedicated, and to the perplexities of their age.

LECTURES BY A LADY-DOCTOR.

Three lectures on physiological and medical science, addressed to women, were delivered recently in London by Elizabeth Blackwell, M. D. This circumstance gave an opportunity to such persons as were either curious, skeptical, or otherwise interested in the subject of "women-doctors," to hear the cause advocated by one of themselves. We were among the number of the curious, and on Wednesday, 2d March, we found our way to

the Marylebone Institute. A goodly company of ladies were already assembled; and among the number were not a few whom the world honors for good work done in literature, art, and, above all, in charitable labor.

After a brief delay, Dr. Elizabeth Blackwell entered the room. She stood with quiet dignity on the platform by the desk, while Mrs. Jameson read the address which had been presented to her, requesting her to give these lectures. Dr. Blackwell was received with a general expression of sympathy. Many of the persons present were fully aware of the almost unexampled difficulties which had attended the prosecution of her singular career—a career which has initiated women to the possibility of a professional study of medicine. A sketch of this lady's life has already appeared in this *Journal*; but to such of our readers as may be unacquainted with the facts, we will briefly give the following particulars.

Elizabeth Blackwell is an *English-woman*, and not an American, as some persons have erroneously believed. Her father was a Bristol merchant, much respected in his native city, but, in consequence of commercial embarrassments, he went to America some years since taking his family with him. He had hoped to re-establish his broken fortunes, but disappointments and early death frustrated these expectations. His family of nine children were left without any other resources than those supplied by endurance and perseverance. After many trials common to their position, two of the sisters conceived the idea of entering the medical profession. In 1849, Elizabeth Blackwell received her diploma from the President of the Medical College of the University of Geneva, in the State of New York.

In one of her lectures, Dr. Blackwell eloquently and feelingly described the privations, the difficulties, the calumnies, which attended her during the prosecution of her studies; but a high interest in the vocation she had adopted sustained her in her earnest resolve to pioneer the way for an extended sphere of usefulness to women—a sphere in which, under one form or another, they are virtually more or less engaged already—but for which their education has left them, if not totally unfit, at least very inadequately prepared.

This brings us to the subject touched upon in the first lecture; namely, the utility and importance of physiological knowledge to women generally. Books without number have been written on home-duties and maternal obligations—the *morale* of all this is accepted and unquestioned. Our lecturer, with much point, delicacy and justness of reasoning, demonstrated the fact that physiology is the basis upon which women must found a knowledge of these special duties. We are all aware of the effects of the general health and equanimity of the mother upon her offspring. We all know that the management of infancy has a direct and sometimes fearful influence upon the

future life of the child. And especially while the physical and moral faculties are in progress of development is the mother's judicious care and direction necessary. Granted, the important function of woman as the guardian of childhood and youth. Now, let us for a moment imagine a person intrusted with a complicated and delicate piece of machinery, which must and, indeed, *can* only be preserved by constant care and attention. Imagine that person to be ignorant of the principles of the construction of that machine; y unob-servant of its workings, its powers of application, its possible derangements; y unconscious that certain conditions are injurious, and often fatal to its organization; y imagine, we repeat, such a state of things, and what would be the result? The answer is self-evident, and yet that precious thing called *health*—the health not only of individuals, but of families—is in the hands of women whose education has never included even the most elemental knowledge of physiology.

Be it clearly understood that we are now speaking of physiological knowledge in reference to the *preservation* of health; professional aid is sought when remedial efforts are absolutely essential, but how frequently does it not happen that this state of disease is consequent upon want of foresight, want of judgment, want, in fact, of the application of the commonest hygienic principles.

In the savage state, where nature is allowed free play, it is true, pharmacy is confined to some few simple herbs, and professorships are not. But we who are living in an artificial condition are bound to assist nature out of the difficulties with which we ourselves environ her. Dr. Blackwell dwelt at some length upon the laws of health, the fitness of the pursuit for feminine study, and the possibility of improving the general standard of health. There is a homely saying, "It is easier to prevent than cure," but it is a saying more frequently quoted than practised—so called "common sense" is insufficient without a knowledge of principles, and surely that knowledge, without being exclusive or pedantic, might be admitted into the general education of females.

The lecturer dwelt on the benefits likely to arise from the cultivation of the science of physiology. The mental and moral progress is so intimately connected with physical conditions that no person is worthy the name of educator who does not carefully observe the action and reaction of the mind on the body—the body on the mind. We were reminded of several pertinent instances of the power of the will in shaking off disease. We ourselves know of a case where hydrophobia was arrested by a tremendous effort of the will. The power possessed by man of preventing or controlling insanity, is a subject of the highest importance, and one, we think, deserving of further investigation than it has ever yet received. There is a class of phenomena which, though not yet sufficiently assured, may some day help us to an

understanding of the abnormal state of the brain. Any disturbance of the due equilibrium is injurious. The lecturer pointed out the necessity of acquiring or avoiding certain habits of thought, of varying employments, as among the many means of maintaining mental and physical health. Dr. Blackwell mentioned the singular fact, that there are two classes of people, the most widely separated by social rank, whose numbers are thinned by death and disease, beyond the average of their fellow-citizens. These classes are represented by the common soldier of the barracks, and the fine lady. For months past, the newspapers and periodicals have been teeming with facts relative to the sanitary condition of the army; fashion yields her statistics more grudgingly; but monotony of life, vitiated air, deficiency of exercise, want of duties and employment, and injurious release from care and self-dependence, contribute, together, to identical results, in cases which at first sight seem as dissimilar as the poles.

Individuals are lost sight of in a system; but no system, however wisely conceived or humanely practised, can abrogate that law of nature which we understand by self-development—hence *all* persons ought to know something of that frame which is so "fearfully and wonderfully made." "A little knowledge is a dangerous thing," is the oft-repeated adage of the satisfied ignorant. No knowledge at all is still more dangerous. Would that statistics could reiterate again and again the number who are sacrificed annually to ignorance and neglect, on the one side, and to the omnipotence of fashion on the other. Social life is ruled by women—let women inform themselves of the evils which lie in and about it.

To women as dispensers of charity, physiological knowledge is essential; and though much has been done by the noble institutions of our country, much special work remains for women—the name of Miss Nightingale is sufficient to endorse this statement with authority.

In a Journal of this character, we can only allude to the more purely medical portion of Dr. Blackwell's discourse. After receiving her diploma in America, that lady further prosecuted her studies in London and Paris, where she received high testimonials. Subsequently, she established herself at New York as a physician for women and children. She has now returned, hoping to find in her native country a sphere of usefulness, and her due meed of encouragement. She proposes to establish a hospital in London for the diseases of women and children, under the care of herself and her sister, who has likewise obtained a medical diploma. We understand, through the medium of the newspapers, that a lady has offered £8,000 towards this object.

It is further proposed that there should be a professorship for instructing women generally in hygiene.

The medical movement in America is successfully progressing. Society there has accepted the fact as one which is full of the promise of increasing utility.

The question of whether the innovation will find favor in England can only be answered by time and trial. If the female branch of the profession had many such able advocates as Dr. Elizabeth Blackwell, we have no doubt that indefinite progress would be made ere long, and that an assured position would be gained for the lady-professors. At present, the movement is an experiment. If public opinion might be tested by Dr. Blackwell's sympathizing audience, we should certainly pronounce a favorable augury.

There is one remark we will make in conclusion—that the power of *intuition*, characteristic of the feminine intellect, is admirably calculated to assist in discovering particular forms of disease, especially that class which is connected with hysteria—often so subtle, so complicated in its symptoms.

After the conclusion of the course, Mr. Jame-son, in the name of the ladies present, returned thanks to the accomplished lecturer; and so terminated a very interesting and certainly a very novel gathering, which, we doubt not, will afford subject for much earnest thought.—*Chambers' Journal*.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, EIGHTH MONTH 6, 1859.

DIED, 6th mo. 3d, 1859, at the residence of her brother, Robert Titus, ELIZABETH TITUS, aged 49 years, only daughter of George P. and Mary C. Titus, much beloved by her relatives and friends; a member of Westbury Monthly Meeting, Long Island, N. Y.

THE POWER OF KINDNESS.

What a wondrous power has kindness; it softens the hardest heart and tames the most savage beast. Everybody and everything yields to its all pervading power. It binds up the broken heart and soothes the departing spirit—it lends an additional charm to beauty and makes plain features seem beautiful.

No one ever did or ever will lose anything by kindness. Is anything gained by being cross or ill-natured? No, on the contrary, try the power of kindness—be kind to everybody and they will love you—no matter what they say or feel at the time. That kind word or act will never fade from their memory. They will have a much deeper respect for you, at least, than if you had spoken or acted harshly. Even to a servant, speak kindly, it will not be lost—they will serve and like you all the better for it. Be kind to animals. Is it not better to have your dog come bounding out to meet you—with a

smile on his shaggy phiz—laughing and frisking in anticipation of your caresses—than to see him slink away at the sight of you—his tail between his legs and a gloomy foreboding on his face of the expected “get out, sir.” If you be a man and married, be kind to your wife and children—your wife surely has enough to fret and worry her without your coming home and beginning to find fault about some trifling thing.

Be kind to your children—if they grow up with harsh reproofs and angry words ringing in their ears—with scowls and gloomy faces before their eyes to check their innocent mirth—think you that they will be good and respectable men and women—that they will love and respect you—that they will all try to make your declining years comfortable? No, as soon as they can, they will go way from such a home—very likely to plunge into all the dissipations and vices they can find. Yes, be kind to your children, speak kindly to them—gratify their few desires—join them in their sports—take an interest in their studies—and mark my word, you are laying up ten times more towards a *truly* happy, cheerful and comfortable old age, than if you were earning hundreds of dollars at the same time. For what profiteth a man if he gain the whole world and lose his own soul?—*Germantown Telegraph*.

FEMALE INDUSTRY.

(Continued from page 312.)

The number of women employed in textile manufactures in 1851 were nearly 385,000. Under this head are included cotton and its fabrics, woollen, flax, silk, straw, lace, and articles in fur, hair and hemp, and the paper manufacture. In the mechanical arts which usually rank in the same class, such as metal-works and earthenware, there were nearly 40,000. With these two classes may be united the third,—the women engaged in providing and treating Dress;—making, mending, and washing articles of dress. These are set down as above half a million. The three amount to within a fraction of a million. If we could include the women of Ireland, so largely engaged in the linen, cambric, and muslin manufactures of Ulster, and in the embroidery of muslins (as we have already shown,) and in lace-making and knitted goods, the number would be greatly increased. Now, what a section of the nation this is,—a million and a quarter of women above twenty, earning an independent subsistence by manufacturing industry! The condition, claims, and prospects of such a section of the population ought to be as important and interesting to us as those of any class of men in the community.

The three sorts of employment need not here be considered separately. In the case of textile manufactures, the greater part of the work is done in factories; but not a little is carried on at home,—looms being set up in the cottage, or

in the town lodging. In such old towns as Norwich, and in many a village in the eastern counties, the click and smack of the loom is heard in the narrow streets and over garden walls, as it is in the singular region of Spitalfields. A visitor will find the family engaged in winding, piecing and weaving,—father, mother, boys and girls all doing different parts of the work: and this is just the case of a large proportion of the Birmingham metal workers. They have a light room which they call a shop, where they work together at the articles which are to be completed by a certain time. So it is with the occupations which relate to dress. The lace-maker is an old fashioned figure in English life,—sitting at her door with her pillows before her, and her fingers busy among the bobbins. So it is with the straw-platter, and the clear starcher and mender, and the artificial-flower maker, and the embroiderer, and, as we may see in every street, with the dress-maker. The 'Song of the Shirt' tells us that this is the way also with poor needlewomen. On the other hand, the factory, and gregarious occupation in many modes, is not now, as formerly, supposed to mean cotton or flax spinning. Silk, cotton, and flax mills may still be the representatives of the factory life of English women; but genuine factory-life can be seen at Birmingham as truly as at Manchester or Leeds. Long ranges of upper apartments in Birmingham factories are occupied by women, sitting in rows, quiet, diligent and skilful, putting together the links of cobweb gold chains, or burnishing silver plate, or cutting and polishing screws, (a manufacture mainly in their hands, because the machinery requires delicate manipulation,) or sorting needles, or painting *papier-mache* trays. Of the 40,000 female workers in metals and clay, the greater portion now are factory women, as much as any Lancashire or Yorkshire spinners or weavers. As for the third class, not only are the Nottingham and Leicester lace-makers and hosiery weavers of the genuine manufacturing class, but the London dressmakers may be called so; and the upholstresses too. They are collected, not always in large apartments alas! but in considerable numbers, and under a scheme of division of labor,—which is, we suppose, on an extensive scale, the distinction between domestic and factory labor; a distinction not interfered with by the distribution of portions of the work to different members of the family at home. Whatever may be the respective proportions of the factory and domestic workers who make up the million and a quarter of industrial women now under notice, it is a question of the deepest interest to us all, in every view, whether the factory work is likely to increase or diminish in years to come.

At first sight, most of us are disposed to pronounce that the number will certainly increase. The demand for industry seems at present rather

to exceed the supply,—generally speaking. We want more soldiers, more sailors, more agricultural laborers and rough workers, while emigration carries off tens of thousands every year. The rapid increase of labor-saving machinery indicates a want, rather than a superfluity, of hands; and so does the liberty to work which has been acquired by women within a few years. It is not very long since the Coventry men were as jealous and tyrannical about the women winding silks and weaving ribbons as they are still about their engraving watch plates; yet now many thousands of women are earning a subsistence in the ribbon and fringe manufacture. The increasing use of sewing-machines, at centres of dressmaking, tailoring, and blouse and shirt making, points in the same direction. In a community where a larger proportion of women remain unmarried than at any known period; where a greater number of women depend on their own industry for subsistence; where every pair of hands, moved by an unintelligent head, is in request; and where improved machinery demands more and more of the skilled labor which women can supply, how can there be a doubt that the women will work more and more, and in aggregate ways, as combination becomes better understood and practised? Such is the first aspect of the cases: but there are others. It will not be going out of our way to show by an example that factory life is not everywhere the same; that it does not necessitate the evils of which too many of our manufacturing classes are examples. We conclude as a matter of course in England, that a factory girl cannot make her own clothes, cannot cook her father's dinner, cannot do the household marketing, or cleaning; is, in short, fit for nothing but the spinning or weaving, burnishing or sorting, in which her days are passed. If we can find good evidence that the occupation need not have these effects, it will be a great comfort. There are such evidences in abundance, and the facts work in opposite directions,—on the one hand, extending the inducements to factory labor for women, and on the other, giving the women themselves, a freer choice, and a stronger disposition to remain at home.

Twenty years ago, there were about 4000 women employed in the cotton-mills of Lowell, in Massachusetts. They worked seventy hours per week, earning their meals and from one to three dollars per week. They had built a church, and a Lyceum, and several boarding houses and in the winter they engaged the best lecturers in the state to instruct them in their Lyceum. These factory girls issued the periodical called the 'Lowell Offering,' which Mr. Knight reprinted in his series of Weekly Volumes, under the title of 'Mind among the Spindles.' Prefixed to that volume was a letter from Harriet Martineau, in which the factory life of these literary spinners

was described. They are the daughters and sisters of the yeomen of New England,—some aiming at disencumbering the farm, or educating a brother for the church, whilst others club their earnings to build a house in which to live under the sanction of some elderly aunt or widowed mother. Whole streets of pretty dwellings adorn the factory settlement; and books, music, and flowers within testify to the tastes of the young proprietors. The girls are well dressed, week days and Sundays; and the Savings' Bank exhibits their provident habits. At the date of this account, in 1834, there were 5000 work people at Lowell, of whom 3800 were women and girls; and the deposits, after all the public and private edifices were paid for, amounted to 114,000 dollars.

In a recent publication there is a contrasting view of the same class, employed in a silk mill, under one of these dozen, or twenty, or fifty, or hundreds of good men who are each called by all who know them 'the best employer in England.' It is cheering to find how many 'best' there are. The writer was evidently taken aback at first, confounded by the 'yelling and screaming' of the women in the lane, which she supposed to mean some terrible accident, and astonished at the universal supposition that everybody was purely selfish, and bent upon cheating everybody else. The experiment of inducing a more womanly mode of life among the girls is described in a very interesting way in the tract called 'Experience of Factory Life,' which is in the list at the head of our article. The passage is too long for quotation; but it is to be hoped that our readers will turn to it, if they have any desire to see what the differences between the factory girls of Old and New England really are, and to ascertain whether any part of what is repulsive and lamentable here is owing to the occupation, or to any mode of life which it necessitates. We believe that the conclusion of the best observers will be that it is not the labor of the factory which hardens and brutalizes the minds of men or women, but the state of ignorance in which they enter upon a life of bustle and publicity. The Lowell Factory girls are great reciters and even writers of poetry; the Sunday sermon is quite a pursuit to them—as in puritan New England generally. Literature and music are the recreations of many of the factory girls of the mills. Now—can the chasm be bridged over which divides these conditions of factory life? Can the English factory girl be made as womanly as other people? If so, what is the effect on the industrial aspect of affairs?

We find something like an answer to this in such accounts as we can obtain of the operation of evening schools on this class of people. There was a narrative published in 'Household Words,' we remember, some years ago, which afforded

great encouragement. In that case the girls were eager to learn to write, above everything, one explanation being 'Hur wants to write to hur chap,' who was gone to Australia; but where it was possible to deceive themselves about their own ignorance they did so. No girl could pretend to write when she did not know a letter; but whenever they could fancy themselves treated like children, they put on airs of resentment,—as when one, who had to spell *ox* and say what it meant, exclaimed 'As if everybody didn't know that a *hox* is a cow!' They fancied they could sew till a pull at the thread undid half a yard at a time. They were averse to bringing clothes to mend, but liked making new smart gowns. They were partly interested and partly offended at the instruction given about the human frame and its health—one, who was laced up into the shape and stiffness of a tree stem, exclaiming that she had 'got only six and twenty whalebones.' Some of them had witnessed a sad misfortune,—the first and fatal quarrel of a married couple, from the bride having rendered her husband's one white shirt unwearable, the first Sunday after their marriage, by starching it all over, 'as stiff as a church.' She had spent two days on the job; neither of them knew how to get the starch out: and the bridegroom cursed his spouse as a good for nothing slattern. Such cases were coming before them every day. The handsome shawl which the lover so admired on Sundays was found to be pawned on Monday mornings, and redeemed on Saturday nights. All clothes had to be bought ready-made, and all food prepared, as far as it could be. The bread and the ham,—a shilling plate at the time,—were obtained on credit at the huckster's shop; and, to obtain that credit, every article of every sort had to be bought at that miscellaneous shop. The wives could not boil potatoes, nor mend stockings, nor wash a garment, nor even scrub the floor. These deficiencies sent pupils—married women as well as single—to the evening school, eager to learn. What was the consequence? A vast complacency in carrying home a garment of their 'own making,' and a desparate set-to at arithmetic in its ordinary form. The sorters could reckon by grosses, miraculously; but had no notion of pounds, shillings and pence: and, sooner or later, the notion dawned that it might be *worth while* to be comfortable at home, and that their teachers meant to show them how to manage it. At a more advanced period, came further discoveries. The wife who locked her door before daylight, and turned her back upon her home till dark, except on Sundays, obtained a good deal of money: for at that time women's factory wages had risen twenty per cent., and were still rising: but yet there was never any cash left over, and generally more or less debt at the huckster's shop. When able to keep accounts, even in the humblest way, the wife oc-

asionally found a penny set down in the shilling column,—not necessarily from dishonesty, for the small shopkeepers themselves are often very ill-educated. This discovery led to inquiry and thought; till the grand idea presented itself that it might answer better, even in regard to money, to stay at home than to work at the factory. No more plates of ham or light loaves! no more expensive washing bills, or heavy purchases of ready made clothes, or fancy head-dresses which cost nearly a week's wages! No more hard potatoes, smoky fires, and tea smoked accordingly! No more damp, half grimy floors on Saturday nights; nor husbands driven elsewhere in search of comfort! If they earned twelve shillings a week less, they saved twelve shillings a week, and much of more valuable things that no money can buy.

Since those early attempts at schools for wives were instituted, great improvements in particular cases have become common: but there has not yet been that distinct step in civilization which gives every woman in a manufacturing town the clear understanding that she has to choose between being an earner of money in a way which precludes her being a housewife, or being qualified for a housewife, at the expense of some of her power of earning, but with great power of saving her husband's earnings. We need not despair of seeing girls so educated as that they may be capable of both employments; and this is well, as there can be no expectation that, within any time we can look forward to, the employment of women in factories will cease. If it is ever superseded, it will not be by the labor of men, but by new inventions: and in the interval it will do no good to declaim, and exhort, and lament. We must take in hand the evils of the case, and improve its conditions. We must see whether we cannot make needlewomen and plain cooks of the little girls, and sensible housewives as they grow up. This done, we suspect that not even the best paid factory labor will throw them back to the point from which many of the class are now rising.

(To be continued.)

SPARE MOMENTS.

A lean, awkward boy came one morning to the door of the principal of a celebrated school and asked to see him. The servant eyed his mean clothes, and thinking he looked more like a beggar than anything else, told him to go around to the kitchen. The boy did as he was bidden, and soon appeared at the back door.

"You want a breakfast, more like," said the servant girl, "and I can give you that without troubling him."

"Thank you," said the boy, "I should have no objections to a bit of bread; but I should like to see Mr. ———, if he can see me."

"Some old clothes, may be, you want," remarked the servant, again eyeing the boy's patched trowsers. "I guess he has none to spare; he gives away a sight;" and without minding the boy's request, she was away about her work.

"Can I see Mr. ———?" again asked the boy after finishing his bread and butter.

"Well, he's in the library; if he must be disturbed, he must; but he does like to be alone sometimes," said the girl in a peevish tone. She seemed to think it very foolish to admit such an ill-looking fellow into her master's presence; however she wiped her hands, and bade him follow. Opening the library door, she said:

"Here is somebody, sir, who is dreadful anxious to see you, and so I let him in."

I don't know how the boy introduced himself or how he opened business, but I know that after talking a while, the principal put aside the volume which he was studying, and took up some Greek books, and began to examine the new comer. The examination lasted some time. Every question which the principal asked the boy, was answered as readily as could be.

"Upon my word," exclaimed the principal, "you certainly do well," looking at the boy from head to foot over his spectacles. "Why, my boy, where did you pick up so much?"

"In my spare moments," answered the boy.

Here he was, a poor hard-working boy, with but few opportunities for schooling, yet almost fitted for college, by simply improving his *spare moments*. Truly, are not spare moments the "gold dust of time?" How precious they should be! What account can you show for them? Look and see. This can tell you how very much can be laid up by improving them; and there are many, *many* other boys I am afraid, in jail, in the house of correction, in the fore-castle of a whale-ship, in the tipping shop, who, if you should ask them when they began their sinful course, might answer, "In my *spare moments*."

In my spare moments I gambled for marbles. "In my spare moments I began to smoke and drink." "It was in my spare moments that I began to steal chestnuts from the old woman's stand." "It was in my spare moments that I gathered wicked associates."

Oh, be very careful how you spend your spare moments! Temptation always hunts you out in small seasons like these, when you are not busy; he gets into your hearts, if he possibly can, in just such gaps. There he hides himself, planning all sorts of mischief. Take care of your spare moments.—*C. Knight*.

It is a beautiful custom in some Oriental lands to leave untouched the fruits that are shaken from the tress by the wind; these being regarded as sacred to the poor and the stranger.

From The Salem Register.

MAGNITUDE OF OUR PUBLIC WORKS.

It has been fashionable to compare unfavorably the works of this country with those of Europe. To such an extent has this been carried that it is not unfrequently said that we have to look to England or the Continent for most of our examples. We are continually told by travellers of the great extent, beauty and durability of the continental works, and of the enormous strength of the English structures. Now it is perfectly true that Europe can boast of railroads, canals, bridges and aqueducts unrivalled in the world for beauty and excellence of workmanship and design, but it is equally true that America can point to works of utility that, in the magnificence of their proportions, are not exceeded anywhere.

The Julian Aqueduct of Rome, is two miles longer than the Croton Aqueduct of New York, built by John B. Jarvis and Horatio Allen, but the Croton carries more water than all the seven aqueducts of Rome put together, and more than any other aqueduct in the world, and is longer than any other excepting the Julian.

The Illinois Central Railroad, built by Colonel Mason, is the longest line ever constructed by one company, and in point of workmanship is equal to any European road.

The National Road, over the Cumberland mountains, built by the United States Engineer Corps, is more extensive and durable by far than the Appian Way.

The stone arch over Cabin John's Creek, on the Washington aqueduct, built by Captain Meigs, is about fifty feet greater span than any other stone arch in the world, and is more beautiful in proportion than the arch over the Oco, so long celebrated for its magnificence.

The tunnel built by Mr. Haupt, on the summit of the Pennsylvania Railroad, was a more difficult work than the tunnel under the Thames.

The structures on the Baltimore and Ohio Railroad at Harper's Ferry, and beyond the Summit, built by Latrobe; and the Starrocca Viaduct, on the New York and Erie Railroad, built by Julius Adams, are equal in magnificence and excellence of workmanship to anything Brunel ever did in England, or Moran in France.

The Suspension Bridge over the Niagara river at Lewistown, built by Major Serrell, is 1,042 feet 10 inches in one span, and is 43 feet greater than any other single span in the world, being nearly twice as great and quite as strong as Telford's celebrated bridge over the Menai Straits in England.

The United States Dry Dock at Brooklyn is the largest dry dock in the world by many feet. The workmanship, done under the direction of Mr. McAlpine and General Stuart, is equal, if not superior, to anything of the kind anywhere. The plates of iron used in the gates of this dock

are the largest that had ever been made up to the time they were rolled.

The flight of combined locks on the Erie Canal at Lockport, built by the State Engineers, are equalled only in one other place in Christendom, Sweden.

The Railroad Suspension Bridge, built by Roebling over the Niagara, is within a few feet of twice the span of Stephenson's great Tubular Bridge in England, the largest structure of the kind. It is 800 feet in one span, and is two stories high, the railroad being above the public highway. Nothing like this exists anywhere else.

The Light-house on Minot's Ledge, being built by Capt. Alexander, is in a more exposed situation, and as far as proceeded with, is more securely bolted together than the famous Eddystone Lighthouse in England.

The bridge at Wheeling, built by Charles Ellet, is exceeded only in span by the Lewistown Bridge, and is heavier than it; it is the second largest span in the world, and is much more beautiful than the Fribourg Bridge, its European rival.

In carpentry we are unexcelled in the world. Such structures in timber as the Dry Docks at San Francisco and Philadelphia, McCullam's and Col. Seymour's bridges on the Erie Railroad and branches, the timber viaducts on the Catawissa Railroad, built by Stancliff, Col. Long's bridges on the various New England Railroads, and Howe's trusses at Harrisburg, have not their equals across the Atlantic.

Then, again, in Europe, many structures are built that might have been avoided—a few hundred rods of detour would have saved the great Box tunnel. Now we maintain that the location of Slidell's division, for example, on the Erie, evinced more skill in avoiding the necessity of great structures than could be shown in building them.

The stones on either corner of the Exchange in Boston, built by Rogers, are larger than any single stone in Cleopatra's needle, and those now being put into the United States Treasury at Washington, are much heavier than any stone of Pompey's pillar, or the Pyramids of Egypt.

As to the difficulties of location, there is no country where more science and skill have been brought to bear than in ours, and it is a remarkable fact that, in point of time, last year, our average travelling was faster by two and a half miles per hour than in England, comparing our principal lines with theirs, while the charges on the American lines were but little over half the English rates.

The reason why these things are not generally known is, that here we build a great work, announce its completion in the same advertisement that heralds the opening of the road, and no more is said about it, except, perhaps, what may appear

in one or two scientific periodicals, where dry feet and inches, stress, strain and tortion are discussed, and are never read except by the professional engineer. While on the contrary, in England and France, as soon as a great work is built, and while it is being erected, pictures by thousands are published, medals are struck and circulated, glass models are made, and the illustrated newspapers show it in every stage of progress and from every point of view; the engineer is knighted, if he is not already of the nobility, and the fame of the structure is sent from land to land; while with us, as we have shown, may be found some of the most gigantic works ever undertaken that are passed by and over without hardly any notice. It is remarkable that the best popular descriptions of our own public works of great magnitude are to be found in the journals of France and Germany.

For Friends' Intelligencer.

THE MOUNTAIN RILL.

One morn we took a mountain ride, and as we climbed the hill,
We came upon a level spot where our tired horse stood still.
The sun had not yet peeped above the hill top crowned with trees,
And graceful forms that edged the path waded in the morning breeze.
From out the rock a little rill stole down with noiseless flow;
And careful hands had placed a spout and rustic trough below;
Which, ever full, detained it not, but as it overflowed,
It watered all the herbage round, then stole across the road.
We drank and rested, musing thus—How vain is human pride;
Man cannot bid the spring gush forth from out the mountain side;
As powerless to command one drop of that diviner stream
Which, whoso drinks of, all beside but muddy waters seem.
How sweet the lesson taught us by the little mountain rill;
Man may prepare the reservoir, but God alone can fill!

Highland Dale, 7th mo. 23, 1859.

RELIANCE ON GOD.

If thou hast ever felt that all on earth
Is transient and unstable; that the hopes
Which man reposes on his brother man
Are oft but broken reeds; if thou hast seen
That life itself "is but a vapor" sprung
From time's up-heaving ocean—deck'd, perhaps,
With here and there a rainbow, but full soon
To be dissolved and mingled with the vast
And fathomless expanse that rolls its waves
On every side around thee; if thy heart
Has deeply felt all this, and thus has learn'd
That earth has no security;—then go
And place thy trust in God. The bliss of earth
Is transient as the color'd light that beams
In morning dew-drops. Yet a little while,

And all that earth can show of majesty,
Of strength or loveliness, shall fade away
Like vernal blossoms. From the conqueror's hand
The sceptre and the sword shall pass away,
The mighty ones of earth shall lay them down
In their low beds, and death shall set his seal
On beauty's marble brow, and cold and pale,
Bloomless and voiceless, shall the lovely ones
Go to the "congregation of the dead."

Yea, more than this; the mighty rocks that lift
Their solemn forms upon the mountain heights,
Like time's proud citadels, to bear the storms
And wreck of ages! these, too, shall decay:
But the power of God, his goodness and his grace,
Shall be unchanged—the same in love,
In majesty, in mercy;—then rely
In faith on him, and thou shalt never find
Hope disappointed or reliance vain.

Correspondence of The N. Y. Tribune.

THE AQUARIAL GARDENS.

Boston, May 20, 1859.

Conspicuous among the shows that attract the admiring gaze of passers by, for a year past, have been the aquaria in the windows of Philips, Sampson & Co., in Winter street. Tastefully arranged, well cared for, and constantly replenished, as death, or internal warfare may have thinned out the population, they have always allured a wondering crowd, curious to observe the social habits and modes of life of these hitherto unknown dwellers beneath the sea. But the shrimps that inhabit the crystal palaces of Philips & Sampson hide their diminished heads, the soldier-crabs retire into their shells as far as they are able, the anemones shrink back into themselves, and grow dim, in comparison with the splendors of the denizens of the "Aquarial Gardens" in Bromfield street, that have now been open for public exhibition some three or four weeks. Interested in them by reason of the perils and pleasures passed through in "A Summer's Cruise on the Coast of New-England," I have visited the "Aquarial Gardens" often, and am moved to write some account of this novel exhibition.

The Aquaria of Messrs. Cutting & Butler are displayed in a fine, well-lighted hall in Bromfield street, which was formerly occupied by the Mercantile Library Association, and is admirably adapted for the purpose by the excellent arrangement of the light from the dome and the windows on both sides of the apartment, so that the translucent dwellings of the marine strangers are well illuminated in the most secret corners.

The Aquaria are arranged upon tables of convenient height, extending round the room in an oval form, visitors being able to pass on either side of the tables. In the center of the hall is a large octagonal tank, of some eight feet in diameter, in which two sturgeon, a fish rarely seen except by fishermen, are peacefully and comfortably gliding about. These beautiful specimens are now about three feet in length, and will doubtless rapidly increase in size.

The tanks in which the specimens are exhibited are real crystal palaces, made of beautiful white marble, as to the bottom and ends, while the sides are of the clearest and most perfect plate glass. The interiors are tastefully arranged with rocks, gravel, seaweed and other water plants, adapted in all cases to the habits and customs of the inhabitants. Some are filled with sea water, and some with fresh, all being aerated perpetually by a bubbling current of pure air which is forced through pipes and ascends in sparkling bubbles through the gravelly bottom to the surface of the water. This plan of aerating the water I understand to be an invention of the proprietors, and to be so successful as entirely to remove all necessity for any change of the water, except to supply the waste caused by evaporation or accident.

Not only are the fishes well ventilated, in the manner that I have described, but care is also given to preserving a proper *temperature* of the water, so that the brook trout, on a warm day, are rejoiced, and comforted by a generous lump of ice, to bring back the sun-heated waters to the more genial temperature of their native mountain brooks.

The strong light in which the aquaria are placed has a queer effect upon the fishes, promoted, too, somewhat by the light-colored pebbles, which, for the most part, form the bottoms of the tanks, inasmuch as it bleaches them out in a very odd manner, so that the familiar *tautog*, (or *black*, fish), for example, that off Tinker's Island last Summer, was of almost raven darkness, is here paled to a ghastly hue, so that in his changed color, the well-known fish is so thoroughly disguised, that at first glance he is hardly recognized. The specimen here was born and bred in an aquarium, and has now attained some two years in age, and a goodly size. He comes quietly to the surface when called by a low whistle, or a snap of the fingers, and, for all his pale complexion, seems healthy and well contented. His habits are not a little curious, reminding one very much of the ways of a well-fed hog in a sty, lying as he does, on his side, upon the bottom, under a waving shade of seaweed, looking about him languidly with his staring eyes, and ever and anon rolling lazily over, and reclining for a time upon the other side, and taking a different, and at the same time indifferent view of the curious faces that surround him.

The brightly speckled trout, too, in the glare of day and sunshine, fade into a lighter hue, and though, like the leopard, they cannot change their spots, unlike the Ethiopian they very considerably change their skins.

Among the smaller fishes none have attracted a greater attention than a couple of male sticklebacks, who have been engaged in taking care of the spawn left as a pledge of their affectionate union by their fair partners, who have been re-

moved to another tank, after having deposited it. The males have carefully built nests over the precious deposits, one at each end of the tank, carrying with laboring toil little stones and sticks, and fragments of weed, and have raised a little pile above each collection of eggs, watching all the while, with anxious care, lest any harm should befall. And now, since the young are hatched, they mount guard with paternal care over their minute progeny, so small, that as yet it requires an experienced eye to see them before they have been pointed out. If the finny infants wander too far from the paternal roof, the parent blows them back with a little stream from his mouth, gently to the nest. I regret, on a later visit, to see that this interesting little family has entirely disappeared, in consequence of the unfortunate whim taken by the paternal head, who, like Saturn of old, has swallowed them head and tail and swims solitary and alone, fearless of the attacks of any heirs to his now undisputed throne. They grew with wonderful rapidity after they were hatched, and their loss is much regretted by the frequenters of the Aquarial Gardens, where, during their short existence, they attracted much notice, especially from the great authority of the scientific world, Agassiz, who often visits the room with delighted interest. Indeed, the *fishes* seem to be the objects of the greatest interest to most visitors, partly from their larger size, and in part from the novelty of seeing deep water fish so closely as to observe their movements and habits at leisure and with minuteness. The various families of crabs, and molluscs of divers kinds have been made quite familiar objects to most people in the shop windows where aquaria are exposed for sale. Among the objects of this latter class nothing equals in beauty the *Rhodactina Davisii*, predominant in size and the splendor of its salmon-colored tentacles, which, when fully expanded, render it one of the most beautiful, objects conceivable. As rich in color and graceful in form as a passion-flower, the wonderful element of *animal life* is added, to give it a new glory. This beautiful creature is dredged upon George's Bank, and received its name from Agassiz in honor of Commander C. H. Davis, formerly of the United States Coast Survey, and recently in command of the sloop *St. Mary's*, in the Pacific. Anemones and medusæ of various size and beauty are here in abundance; the latter drawing the admiring gaze of all as they pump themselves so gracefully and wonderfully through the water. After all, there is nothing in all animated nature so passing strange as these curious transparent creatures, known as jelly-fish, when cast away in the receding tide upon our beaches, where they dissolve in the sun into a mere film upon the sand. Very beautiful are they as you see them in deep waters, pulsing along, with movements as regular as those of an ocean steamer; and still more beautiful, as

you lean over the side of your vessel at night, when they float by in the darkness, sparkling with phosphorescent light. The fishermen call them *sun-squalls*, and their variety is infinite, as well as their size, which varies from a body as large as a pea, to a foot and more in diameter. At sea, you never tire of watching these larger specimens; and here, in the aquaria, the movements of the smaller species may be observed with convenience as they mount like aquatic balloons or bubbles through the water, and descend again at pleasure.

Some tanks inclose more familiar forms, and we see perched upon a pile of rocks a crowd of spotted turtles and frogs contending with each other for the most desirable posts. In another are clams, and lobsters, and crabs: tadpoles scull about, with legs half developed and tails very much so, and here and there the stranger figure of a lizard.

Strangest of all the lizard tribe is the *Menobranthus*, a singular animal (from Lake Superior) breathing through gills, which, unlike those of other creatures, instead of being stowed away *inside* of his body, are conspicuous ornaments adorning the outside, waving about his head gracefully in the vicinity of his ears, thus being not only useful but ornamental. There were two of these curious reptiles, but their tempers were incompatible—they fought, and one has been gathered to his fathers.

Conspicuous among the ugly monsters of the deep may be seen the sculpin, specimens of which are caught in great abundance by the young amateurs in fishing from our bridges and wharves, and in no less abundance in deep waters and good fishing grounds. Is there any keener disappointment than that of the fisher, who fancies a cod or a pollock of fair proportions safely hooked on the end of his many fathoms of line, when he laboriously draws to light the hideous "grubby," as the fisherman of these parts called them? Now he lies among the pebbles, pale like his companions, perhaps a little more repulsive for his pallor than he is *au naturel*.

But the "grubby" must strike his colors and yield the palm of ugliness to the sea raven, which is more hideous still. The specimen here is small but ill-favored to a wonderful degree. Ragged and uncouth in figure, he lies among the waving weeds at the bottom of his tank, scarcely distinguishable from them, glaring around with eyes that look anything but amiable in their expression. His looks however remind me of one desideratum in this department of the exhibition, and that is an uncouth monster that the fishermen have christened the goose-fish, which presents a flat expanse of body, somewhat like that of a flounder, of some 36 inches or more in diameters, of which the mouth apparently occupied 35, and yawns, a horrid abyss, armed with double rows of teeth as sharp as needles, all across the

fore part of the body. This prodigy of ugliness would strike terror into the visitors of aquarial gardens, I am confident, more than any other fish that swims in the sea. Naturalists call him the "*Lophius piscatorius*."

All the commoner variety of fish, both from salt and fresh waters, may be seen here—trout, perch, pout, eels, flounders, smelt, pickerel, bass—in short, all the common fishes of our waters. The tanks are of such size, some of them being, perhaps, five feet in length, that they have ample room to swim and play at pleasure, while the visitors have the freest approach to the tanks and can examine as closely as they please—some excellent glasses of high magnifying power being provided for the inspection of the smaller specimens, or for observation of the motions of some of the larger mollusks, which are of great interest.

The exhibition has already drawn numerous visitors of the most intelligent of our people whose interest increases with every visit, the natural consequence of an investigation into the habits of a hitherto quite unknown class of living creatures. It cannot be doubted that the undertaking will be rewarded by such a large public patronage as it really deserves from the admirable manner in which it is arranged and has been conducted.

It is proposed by the proprietor to enlarge the collection very considerably—in fact, to double it, by adding another room of equal size to the one now occupied. It is not to be a transient travelling show, but one of the permanent objects of interest to be seen by strangers in the city, and studied at leisure by our citizens, who will doubtless soon take a deep interest in that important interest of Massachusetts—the Fisheries.

SHOCKING AFTER-BATTLE SCENE.

The correspondent of the *Daily News* writes from Solferino, on the 27th of June. "Having surmounted many difficulties, on the day after the battle I arrived here with the object of inspecting the plain, now famous in the military annals of Italian independence. The thousands who fell on the memorable day of Friday last were not yet all buried, so that I could see with my own eyes the dreadful and heart-rending traces of that battle of giants. Many gallant fellows, who are now at rest, can yet be seen, both here and at San Martino, stripped naked, and waiting for their last receptacle, which the grave diggers are preparing for them. The number of bodies being so great, hundreds of the peasants of Rivoltella, San Pietro, San Martino, Solferino, and Carriana, were enlisted to perform that painful duty. The scene presented by this mournful ground is still more affecting than at Magenta. Not only was the slaughter far greater,

but the intense heat of the season has corrupted the bodies to a dreadful extent, and all the noble features of men's faces have been hideously decomposed by the process of putrefaction.

As you may easily imagine, the stench has polluted the air to such a degree, that the surrounding villages are in great danger of typhus. Some cases of that terrible disease have already been noticed in the hospital of Castiglione delle Stiviere, and amongst the rural population of Pozzolengo and Castel Venzago. The local and military authorities have of course taken all necessary precautions, as, for instance, that of spreading great quantities of lime both over the ground and within the graves, but they have yet been unsuccessful in checking the pestilential exhalations.

ITEMS OF NEWS.

DEATH OF THE KING OF SWEDEN.—We have, by the steamship Africa, the news of the death of Oscar, King of Sweden. He died at Stockholm on the 8th ult., at the age of 60, having reigned fifteen years. He was the son of the celebrated Bernadotte, and was said to be personally popular with his subjects. For the last two years he has been insane, and his son, Charles Louis Eugene, has administered the government as Regent. He now succeeds his father, under the title of King Charles XV.

The advices by the North Briton are of a highly important character.

A treaty of peace between Austria, France and Sardinia, had already been concluded.

The provisions of this treaty are briefly as follows:—

An Italian confederation is to be formed, under the honorary presidency of the Pope of Rome.

Austria concedes Lombardy to France.

Napoleon, in turn, grants those possessions to Sardinia. Austria retains her right of rule over Venice.

The steamer left Liverpool before the effect of this news had time to be developed.

The Paris *Moniteur* explains the circumstances attending the armistice. It says the great neutral Powers had exchanged communications with the belligerent powers, offering plans for a mediation, but were unsuccessful in their efforts, until the French fleet were about to commence hostilities against Venice and a conflict before Verona was imminent, when Napoleon, anxious to prevent further bloodshed, ascertained the disposition of the Emperor of Austria, and finding him willing, the armistice was concluded.

THE COMET OF 1859.—This new comet, discovered by M. Tempel, at Venice, about the beginning of April last, has been observed at Rome by Father Secchi, and at Paris by M. Y. Von Villarcceau. It has been rapidly approaching the sun, and at one time was only about 8,000,000 leagues from it. Since the 29th ult., however, it has begun to recede at the rate of 2,000,000 leagues in twenty-four hours, or twenty-four leagues per second, being a velocity at least two hundred times greater than that of a cannon ball. This velocity is, indeed gradually declining; nevertheless, enough of it remains to carry the comet a distance of 36,000,000 leagues from the sun. As to the distance of the comet from the earth, its nearest approach, which occurred on the 24th of April, was to within 26,000,000 leagues. At present, its distance is about 42,000,000, and by the 30th of the present month it will be 49,000,000 leagues distant from our globe.—*P. Ledger.*

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is still exceedingly dull. The receipts are small but the stock is ample. Old stock superfine is offered at \$5 00 per barrel and fresh ground, new, at \$5 50. The sales to the trade range from \$5 25 to \$5 75 for superfine and from \$5 75 up to 7 25 for extras and extra family, according to freshness and quality. Nothing doing in Rye Flour or Corn Meal. The former is held at \$3 75 and the latter at \$3 62 per barrel.

GRAIN.—There is a fair supply of new Wheat; and with little demand prices are dull. Small sales of prime new red at \$1 20 a \$1 25, and choice white at \$1 30 a 1 33 per bushel. Rye is steady at 79 cents. Corn is in limited supply, but there is very little demand for it. Small sales of yellow at 79 a 80c. Oats are dull; free sales of Pennsylvania at 35 c per bushel for old, and 30 cents for Delaware.

CLOVERSEED comes forward slowly. Sales of fair and good quality at \$5 50 a \$5 75 per 64 lbs. Timothy, if here, would readily command \$2 50. Flaxseed is worth \$1 60 a 1 70 per bushel.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted, per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Penciling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian-Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Atleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, EIGHTH MONTH 13, 1859.

No. 22.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

(Continued from page 323.)

On Salvation by Christ.

King David, when he had committed a great sin, exclaimed in the depth of his contrition, "Create in me a clean heart, O God, and renew a right spirit within me. Cast me not away from thy presence, and take not thy Holy Spirit from me. Restore unto me the joy of thy salvation, and uphold me with thy free spirit." "Thou desirest not *sacrifice*, else would I give it; thou delightest not in *burnt-offerings*. The sacrifices of God are a broken spirit; a *broken and a contrite heart*, O God, thou wilt not despise." Psalm li. 10-12, 16, 17.

It appears that whenever an animal was sacrificed according to the Mosaic law, the blood was sprinkled upon the altar; "for the life of the flesh is in the blood, and I have given it to you upon the altar, to make an atonement for your soul: for it is the blood that maketh an atonement for the soul. Therefore, I said unto the children of Israel, No soul of you shall eat blood, neither shall any stranger that sojourneth among you eat blood," Lev. xvii. 11. Now, "it is not possible," says the apostle Paul, "that the blood of bulls and of goats should take away sins." Heb. x. 4. Therefore, the hearts of the people were not purified by those offerings, unless they came to experience in themselves that "sacrifice of God, a broken and a contrite spirit," which these outward offerings were intended to represent. For as the blood of beasts, which is the life thereof, was to be sacrificed to God; so the carnal nature in man, or the life of the flesh, must be sacrificed

by being broken and contrited before the Lord, through the power of his spirit. "They that are Christ's," says the apostle Paul, "have crucified the flesh with its affections and lusts." Gal. v. 24. "Our old man is crucified with him, that the body of sin might be destroyed, that henceforth we should not serve sin." Rom. vi. 6. This "old man," or carnal nature in man, is predominant in every individual when he has placed his affections upon earthly things, and become subject to the "lusts of the flesh, the lusts of the eye, and the pride of life, which are not of the Father, but of the world." If, then, we would be redeemed from these things, we must be willing to submit to the death of the cross; that is, to have all our animal appetites, and all our selfish desires, subjected to the power of God which is revealed within. For the cross of Christ is the power of God; and it is by this power that we must be "crucified to the world, and the world unto us." This "death unto sin," takes place in all who come to know Christ "the resurrection and the life." "I protest by your rejoicing," says the apostle, "which I have in Christ Jesus our Lord, I die daily." 1 Cor. xv. 31. "I am crucified with Christ; nevertheless I live; yet not I, but Christ liveth in me." Gal. ii. 20. "Know ye not, that as many are baptized into Christ, are baptized into his death?" Rom. vi. 3. This death is not the death of the outward body; for he says of Christ, "In that he died, he *died* unto sin once; but in that he liveth, he liveth unto God." Rom. vi. 10. How did he die unto sin? Was it not by suppressing or subduing the first motions or propensities to sin, as they rose in his heart? "For we have not an high priest that cannot be touched with the feeling of our infirmities; but was in all points tempted like as we are, yet without sin." Heb. iv. 15. And how are we tempted? The apostle James tells us, "Let no man say when he is tempted, I am tempted of God; for God cannot be tempted with evil, neither tempteth he any man: but every man is tempted when he is drawn away of his own lusts, (or desires,) and enticed. Then when lust hath conceived it bringeth forth sin; and sin when finished, bringeth forth death." These desires and propensities of our nature do not become sinful until they are perverted from their original purpose; and in Jesus Christ they never did become so, for he kept them all in subjection to the will of God. They are all good when kept under

the Divine government; for they are then calculated to subserve those purposes for which they were created. Like the animals in paradise, they are all at peace with man, and in obedience to him. And the reign of Christ is intended to bring us back to that state in which "the wolf shall dwell with the lamb, and the leopard shall lie down with the kid, and the calf, and the young lion, and the fatling together, and a little child shall lead them." Is. xi. 6. While man remained in paradise, in a state of innocence, he offered no animals in sacrifice to God; for these were only added or introduced because of transgression; and when Jesus Christ appeared to promulgate and exemplify the new covenant dispensation, he took away the hand-writing of ordinances, and showed that the whole intention of the old law was fulfilled in loving God supremely, and our neighbor as ourselves: for "on these two commandments hang all the law and the prophets." Matt. xxii. 40.

The old covenant, being an outward law, the vessels used in the service of the temple, and the priests with their garments, were purified by sprinkling with outward blood, "which is the life of the flesh;" but the new covenant, being an inward law, "placed in the mind and written in the heart," (Heb. viii. 10,) it was necessary that the soul itself should be purified with better offerings than these,—even with "the blood of the Lamb," which is the life or spirit of Christ revealed within us.

James. As the mind of man is spiritual, it appears very plain to me, that it cannot be washed or purified by any thing of an external nature. If "nothing that goeth into the mouth defileth the man," it is equally plain that nothing that is taken into the mouth, or applied to the body, can purify the man from sin. And it is equally impossible that any outward sacrifice could produce a change in the Divine mind; for we have abundant evidence that he is "the same yesterday, to-day, and forever," and that he is always waiting to be gracious to the repenting sinner. His dealings with man are beautifully exemplified in the parable of the prodigal son, who had wandered far from his father's house, and spent his substance in riotous living. When he came to himself, and determined to go back to his father, confessing his sins and offering to become as one of the hired servants, his father did not stand off and order him to be punished, neither did he lay his punishment upon the other son who had been faithful; but his compassion was awakened by his penitence and the sufferings he had already brought upon himself, and "while he was yet a great way off, he ran and fell on his neck and kissed him." Luke xv. 20.

Father. The character of the parent, as represented in this parable, answers exactly to my view of the Divine character, and it corresponds entirely with the character of Jesus Christ who was

filled with the Divine perfections. But the doctrine that God cannot, or will not forgive sins without a compensation,—and that man not being able to make this compensation, it was made by Jesus Christ, who was appointed or given up to be killed for this purpose, is so inconsistent with the Divine character, that I cannot reconcile it to my feelings;—it appears to me to deprive the Deity of that infinite love which is his most endearing attribute: and if a human parent were to act upon the same principles towards his children, we could not justify his conduct.

John. The advocates of this doctrine say, it was necessary that the infinite justice of God should be satisfied for the sin of Adam, and for our sins; and they allege, that man being finite, could not make an infinite satisfaction.

Father. But I cannot see how man, who is finite, could commit an infinite offence; and if nothing less than infinite satisfaction would answer, then God must die to satisfy his own justice; for he is the only infinite Being. But this conclusion is too absurd to be for a moment admitted.

John. It was only the human nature which was united to God, that died. It is impossible for the Deity to die.

Father. If, then, it was only the human nature that died, what becomes of the infinite satisfaction? It is clear to my mind, that when the sinful nature in man is slain by the power or word of God being raised into dominion in us, then is the Divine justice satisfied; for there is nothing vindictive in the character of the Deity. He does not afflict his creatures for any other purpose than their own reformation; and when that reformation is effected, he is always ready to pardon his repenting children. Even among men, the reformation of criminals is now considered by the humane to be the main object of all the punishments inflicted upon them; and if we could be certain, in any case, that a thorough change of heart had been effected, it would be our duty to receive back the offender into society. But God can see the heart; and he not only sees it, but his spirit still strives with man, in order to reclaim him from the evil of his ways; and we have the assurance that he takes no pleasure in the death of the sinner, but desires that he may return, repent and live. "If the wicked will turn from all the sins that he hath committed, and keep all my statutes, and do that which is lawful and right, he shall surely live, he shall not die; all his transgressions that he hath committed, they shall not be mentioned unto him." Ezek. xviii. 21. "If we confess our sins, he is faithful and just to forgive us our sins, and to cleanse us from all unrighteousness." 1 John i. 9.

This is a very different view of Divine justice from that which too generally prevails in Christendom. The doctrines of imputatives in, and imputative righteousness, appear to me to be derogatory

tory to the Divine character; and I think they must have an injurious effect upon the human mind, because they have a tendency to blind or obliterate all the distinctions of right and wrong. In the first place, this *scheme*, as it is called, charges upon the whole human race, even upon little children, the guilt of Adam's transgression. In the second place, it transfers all this guilt, by imputation, to Jesus Christ, the pure and spotless Son of God; and what is still more absurd, it imputes the righteousness of Christ to all mankind who can believe that he died as their substitute. Now, I believe that God regards every human soul without respect of persons. He sees the wicked as they are, and likewise the righteous; and his language still is, "The righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him." Ezek. xviii. 20. The only true ground of acceptance, is the new-birth: for when Christ's kingdom is established within us, then his righteousness becomes ours; not by imputation, but by our becoming really "partakers of the Divine nature."

(To be continued.)

Some account of the life and religious experience of RUTH ANNA RUTTER, of Potts-town, Pennsylvania, afterwards RUTH ANNA LINDLEY, wife of JACOB LINDLEY, of Chester county.

(Continued from page 325.)

One day, being in great distress, my endeared mother came to the door of my chamber, and I opened it; she came in, and seeing my situation, she kneeled down, and prayed fervently for my preservation. At another time, she came to me in my chamber, and I, being in great agony, threw my arms around her, and asked her what I should do. She told me there was no necessity for my being so greatly distressed, as I was young and innocent. But still, feeling my dress a very great burden to me, and through fear of running too fast, it greatly afflicted me; and one day being retired, I threw myself upon my knees, and took up my Bible, which lay by the bed side, scarce knowing what I did, and opened upon this passage: "Put off thy ornaments that I may know what to do with thee." I also had a dream which further convinced me: I thought I was at the point of death, and there seemed no help for me; and being in great agony, I covenanted with the Almighty, that if he would spare me a little longer, there was nothing which he required of me but what I would give up to, through his grace assisting me; and that the remainder of my days should be dedicated to his service. Immediately after I made this covenant, I thought I saw myself recovered, and in a plain garb, very neat and simple.

Shortly after this, I attended a general meeting of Friends at Uwchlan, and preparatory thereto, as secretly as I could, I took the trim-

ming off one of my plainest silk gowns, and cut off the trail. I had also a black bonnet made without much trimming, which I wore instead of my hat and feathers. There was a considerable number of young girls in company, going to the meeting; and I endeavored to appear cheerful, but my heart was secretly engaged in cries to the Lord, that I might hear something that might be confirming to me; for I was then wavering whether or not I should join the Methodists. We accordingly went to meeting, and soon after I sat down, a deep exercise covered my spirit. After some time, dear William Savery got up, and spoke so exactly to my state, that my heart was much broken, and my spirit contrited within me. We lodged that night at a Friend's house, where dear William also was; who, with some other Friends, remarking our appearance to be in the gay line, wondered a little at our being there on such an occasion; but upon our telling them it was from a desire of attending the General Meeting, they in a pleasant manner expressed their approbation, and spoke encouragingly to us.

After returning from this meeting, the weight and necessity of putting on a plain dress seemed to increase; and one evening, when most of the family were gone from home, I sent to the shop for some plain gauze, and, by candle light, with a darning needle, made a little round-eared cap. Next morning I arose early, but did not leave my chamber till the family had nearly all breakfasted,—being upon my knees, and earnestly petitioning to be rightly directed. After which, I felt most easy to leave off my cushion, and put on the cap I had made. When I went down stairs, my father and mother and a little nephew were sitting at the table; and as I entered the room, my father viewed me in a manner that somewhat affected me, so that I was obliged to retire a few minutes, to give vent to my tears; in which time my father left the room, and I took my seat at the table. But a small portion of breakfast served. My little nephew fixed his eyes on me, in silent astonishment at the alteration. However, I was favored to keep in a degree of quiet; although it was indeed a deep trial to me, to be thus exposed to the observation and remarks of my connexions and acquaintances. But my dear sister and brothers continuing to treat me with their wonted respect and affection, my heart was, I trust, made measurably thankful. I labored under a very heavy affliction from an inflammation in my eyes, occasioned by a cold, taken some time before I changed my dress, and from not taking the necessary care when I left off my cushions, it became fixed in my eye. My health also appearing to decline, from the great exercise of my mind, my parents sent me to the Yellow Springs, where I spent some weeks. It happened to be the time of the harvest frolic; and being persuaded by some company that were there for their health, I went

to see them dance. But oh! the distress of mind which I felt when entering the dancing room, I cannot describe. I seemed as if I was in a fire, and could not stay many minutes, but walked in the balcony; and shortly after left the company, and retired to my chamber, where I gave vent to many tears, and earnestly besought forgiveness for what I had done; after which, I felt a little quiet.

The Springs did not prove effectual in restoring my eye, though my health was considerably mended. In the fall, it was thought necessary for me to go to Philadelphia, and call a consultation of physicians, as my friends were apprehensive I should lose the sight, unless something could be done. The doctors proposed to scarify it, and I felt a willingness to submit to the operation; nor have I any doubt that this heavy affliction was in Divine Wisdom, to wean my affections from the world. But kind Providence did not suffer the operation to be performed; for, although they came many times, with instruments in their pockets, my eye was never in a proper state to receive it. I continued to suffer extreme pain with it for twelve months, great part of which time, I was under care of physicians; but after a time, being favored to seek to Him, from whom all true help cometh, and my dependence withdrawn from those physicians of no value, in a firm reliance that the Lord would restore me in his own time, I became resigned;—and forever blessed be his holy name, he was indeed pleased to restore me without the aid of any human assistance. As he is pleased, often to afflict for wise purposes, so he is graciously pleased to restore, when those purposes are fulfilled.

Soon after my return from the city, in the fall, Wm. Savery visited Potts town meeting, and I happened to be there. He appeared largely in testimony, and spoke so exactly to my state, and his doctrine carried with it such an evidence, that I could no longer doubt the principle; and since that, I do not remember ever to have omitted an opportunity, which was put in my power, of attending Friends' meetings. He also appeared in supplication; in one part of which my mind was so struck with the belief that I should be called into the ministry, that it caused me to tremble from head to foot. After meeting, I invited him home with me; and he having some recollection of me from seeing me at Uwehlan some time before, accepted the invitation. He presented me with a little book, for which I was very grateful; not for the value of the book, but because it was given as a token of regard, from one to whom I felt my spirit nearly united. The next fourth-day, he proposed being at the Monthly Meeting at Exeter; whither my dear mother and myself went, and attended the meeting for worship; and a memorable season it was to me. As we returned home, it seemed as if the face of

nature was changed; and I saw a large field of labor opened, and that the work was not to be done in a day, or month; but that it was a gradual, progressive work, and must go on step by step. For I had begun to conclude, after I had altered my gay appearance, and given up all those vain amusements, of which I was wont to partake, and feeling a degree of peace therein,—that the work was completed, and I had nothing more to do; so was in danger of taking up a false rest. But he who began the work did not leave me here, but caused a renewed visitation of his love to be extended, through this dear instrument. On fourth-day evening he came in late, and lodged, and in the morning, before we parted, had a solemn opportunity with us; in which season, he addressed me by name, imparting much counsel and encouragement, if faithfulness was kept to on my part; telling me also, that the passage through this life was known, even by the most experienced, to be a continual warfare. Which sealed truth I have since been feelingly sensible of: but as it was the first time I ever had been so singularly spoken to, it affected me much.

I had, some time before this memorable visit from William Savery, been greatly exercised about my music. Having a particular fondness for it, and making considerable proficiency therein, I could not give it up, until it was absolutely required; but after this renewed visitation, it seemed like forbidden fruit, and I dare not touch it. However, not being thoroughly satisfied whether it would be required of me wholly to give it up, I wished to be rightly directed: and one night, going to bed under the impression, I dreamed I was playing; and as I touched the strings, they broke under my fingers. This dream, with the feeling that attended my mind, convinced me the time was fully come for me to part with this idol also: which, though a long and continued cross, I was enabled to take up.

I remained steady in the attendance of meetings for above a year a half, before my mind felt at liberty to make application to be received as a member, but, for twelve months preceding, was constrained to use the plain language. In the fall, before I made application to be received among Friends, Job Scott, being out upon a religious visit, lodged at our house. My father was from home, and my mother and aunt, with a beloved friend from the city, and myself, made up the family at that time: and truly, it seemed as if the canopy of Divine love was spread over us, and celestial showers, issuing from the fountain of life, descended upon our habitation. I had, for some time, been in a low spot, and longed for a drop of heavenly consolation: my dear mother, also, had her mind much unsettled, by unprofitably conversing upon Swedenborg's opinions. There was likewise an elderly man in the neighborhood, who had writ-

ten a piece, vainly endeavoring to account for things he ought not. This man happened to be at our little meeting, when dear Job, after sitting a short time in silence, got up with these words: "Who art thou, O man! or O woman! who would of thine own finite understanding presume to investigate the mysteries of the inscrutable God?" The words were solemn and awakening; and he was favored to open matters clearly. It proved, I trust, an humbling season to some who were present. And, through infinite condescension, this dear friend, having a sitting in the family, was dipped into a sense of our state, and administered suitable counsel and encouragement. Also, in a little private opportunity, with tears flowing mutually from our eyes, he mentioned his sympathy with me, and his prospect respecting me; telling me I should have trials, and to remember that it was told me, I should have trials: which assuredly have since fallen to my lot.

(To be continued.)

For Friends' Intelligencer.
JAMES SIMPSON.

As several essays have appeared in previous numbers of the Intelligencer concerning James Simpson, and most of them from his bosom friend, Isaac Parry, I find in looking over his papers a letter addressed to a relative concerning the demise of the former. The substance of the account is contained in "Friends' Miscellany," but the particulars I offer for insertion, and as most of the letter will probably be interesting to many readers of "Friends' Intelligencer," I copy from it as follows. JOSEPH FOULKE.

Warminster, 10 mo. 21st, 1811.

Dear Cousin,—I received thy letter three weeks ago, but through pressure of business and want of opportunity have not yet complied with thy request, which I expect to have an opportunity of performing at our ensuing Quarterly Meeting. Mother has returned from Jersey in good health, leaving Thomas and family well.—It is a season remarkable for good health in this neighborhood.

It is probable, ere this reaches thee, thou wilt have heard that Dr. John Moore, in company with Nathan Harper, and with the concurrence of his Monthly and Quarterly Meetings, has set out to pay a religious visit to the meetings constituting Virginia Y. M.

Our beloved friend James Simpson (as I was informed by his wife and Nathan Harper) being in good health, I believe less than two weeks before his death sawed down a tree that stood near his door, which produced some spasms in his stomach, and which he increased the next day by prizing it down from a place where it lodged; after which he continued poorly, though not so as to be confined to his bed one whole day, nor to occasion any one to set up with him one night;

in which time of indisposition he said that "he would rather die, if he was fit," asking those present "if they thought there was a person on earth that was fit to die;" saying, "there might be that left for the good of others; but as soon as the harvest is ripe, the sickle is thrust in." He also observed that "John doubted when in prison."

Being very unwell the night before he died, the doctor let some blood. In the morning he complained of much weakness, but got up and ate a hearty breakfast, saying it relished so well he could eat as much more. It being their weekday meeting on the 9th of Third month (1811,) he told his wife though he felt so well he would rather she would not go to meeting. He suffered considerable pain during the time of the meeting, but was easier about the time of its breaking up. The doctor remarked that his pulse was then regular, and that there appeared no cause to doubt of its going over; nevertheless in ten minutes after, a change took place.—Nathan Harper coming into the room he said, "Nathan, I believe I am going," a short time after he repeated the same to his wife. After being helped in his chair, and assisted in laying down again, he said without any reserve, "I am going," after which he appeared twice in short supplication, "that he might be released and have an easy passage through the straits." He desired to be turned on his side, and just as that was performed, he said, "*It is done!*" After this he breathed but three or four times, being about an hour and a quarter after the change before mentioned.

It is worthy of remark, that through this last conflict his pain was not very great, his mind was completely collected, and he as composed and free from alarm as perhaps at any time of his life.

These are the most particular features drawn to the life by those present, of the passage from this probationary state of a prophet over whom shall I not say "all Israel mourns?" Not only within the pale of our own Society, but also by others was his praise resounded, and in the newspapers encomiums set forth, one of which concluded with the invitation drawn from his peaceful close, "follow me as I have followed Christ."

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

Elizabeth T. King was the daughter of William C. and Hannah T. Taber, and was born in New Bedford, Massachusetts, on the 18th of 7th month, 1820.

From childhood she was remarkable for a loving, sympathetic disposition, which rendered her thoughtful of the comfort of others, and attentive to their wishes.

Very diffident and retiring, she seemed entirely unconscious of her own power of winning affec-

tion, and was disposed to shrink from observation. But, while gentle and yielding where principle was not involved, she was firm in her impressions of duty, and earnest in their fulfilment.

Richly endowed with intellectual gifts, it was her delight to cultivate them, and for some time the pursuit of knowledge was very absorbing. The facility with which her tasks were acquired, together with her gentle disposition and strict integrity, rendered her a favorite with her teachers, and her school-days were passed with pleasure and success.

Her love of the beautiful was early developed, and she was ever ready to appreciate it wherever it existed. This faculty opened another and lasting source of happiness, which elevated her spirit, and insensibly gave a tone to her feelings. To her every thing in nature had a language; from the delicate flowers and grasses in the meadows, to the splendor of the sunset sky, or the grandeur of the ocean.

In later years her enjoyment of these beauties was chastened and ennobled by her supreme love for their Divine Author, and while admiring their beauty and sublimity, she turned with loving confidence to Him who spread them forth, being able to say, "My Father made them all."

To a person of her imaginative temperament and refined taste, poetry could not fail to be attractive, and her own pen was often employed in thus expressing her feelings. Her timidity and self-distrust were, however, so great, that most of her youthful efforts were destroyed.

The traits noticeable in childhood increased with her riper years, and her memory well stored with incident, her agreeable manner of expression and the refined taste which instinctively selected whatever was valuable, rendered her society very attractive.

Those who knew her, will well remember the charm of her gentle voice and manner, her speaking eye lighted up by the mind within, and the irresistible influence she exerted on all around. This was remarkable through life, and as her mind matured, and other thoughts and feelings gave place to the desire of consecrating her all to God, these powers, chastened and refined by grace, rendered her indeed a polished instrument in her Master's service.

The winter of 1838 was passed in Philadelphia at school, where her health was so much injured by severe application as to occasion her return home. For some time serious apprehensions were felt by her friends lest the injury should be permanent; but at length she was restored to comparative health, and with returning strength her desire for usefulness increased.

Her own description of her feelings at this time was thus given to a dearly loved friend:—

"NEW BEDFORD, 5 mo. 8th, 1839.

Shall I confess that the prospect of returning

health has a tinge of melancholy with its joy? To the humblest among us life has fearful responsibilities, and now I almost shrink, as I stand upon the threshold, and view its cares and vexations again ready to assail me.

I have suffered much since I left you, but the winter has passed almost happily; for, in all that I have experienced, I have been confirmed in my favorite Wordsworth's beautiful belief,

'Naught shall prevail against us, nor disturb
Our cheerful faith, that all which we behold
Is full of blessings;'

which is only another version of the promise we have from higher authority, 'All things shall work together for good.' I will try to feel this accomplished in health, as well as in sickness, and fulfill the only wish I have ever felt about my future life, that I might not live in vain."

Until this period she had seemed almost entirely devoted to the enjoyment of literary pursuits, and the pleasures of the social circle. Though naturally very conscientious, she had not yet given her heart to God. But now He who had formed her for the purpose of his own glory, was pleased to convince her of the unsatisfying nature of even the highest earthly joy—that, of a truth,

"Nor man nor nature satisfy
Whom only God created."

From this time a change was wrought in her feelings, which her own letters to the same valued friend will best describe.

"NEW BEDFORD, 2 mo. 15th, 1842.

I think I am growing more inclined to try every thing by the test, '*Cui bono?*'—not in a devotion to mere utilitarianism, but to examine the bearing of all our business and pleasures on our eternal interests; and I try to withdraw myself from vain speculations, and be *quiet*.

The truth is, we can not buoy ourselves up long; we must have something to cling to which is firm and fast. We are willing to do every thing but yield simple obedience, try any remedy but the waters of Jordan to make us clean; but all this is but a vain endeavor to escape from the simple truth as it is in Jesus. I feel inclined to say with the poet,

'Me this unchartered freedom tires;
I feel the weight of chance desires,
And *Thee* I now would serve more strictly if I may.'

"NEW BEDFORD, 11 mo. 6th, 1842.

If there is any thing which degrades the soul, I think it is a devotion to worldly wisdom and expediency. I have watched its deadly blight creeping over the soul, and withering every noble and generous feeling, till my heart has ached, and does so still. After all, there is nothing which can truly ennoble man but pure, genuine, thorough Christianity. Without it he must not only be wicked and wretched, but degraded and miserable."

(To be continued.)

For Friends' Intelligencer.

I have been much interested in the Essays of Yardley Taylor on the Natural History of Birds, which have been published in the Intelligencer, and I hope he has convinced his readers that birds are among the best friends of the farmer and horticulturist, and deserve to be kindly cared for and protected. Thousands of these bright and beautiful songsters are annually destroyed by thoughtless boys through mere wantonness, and tens of thousands more are shot upon the wing to gratify the destructive propensity of gunners, or perhaps from an apprehension that they are injuring the grain, and fruit trees.

It has been wisely ordered that the feathered tribes require large quantities of food, and this has been provided in the millions of insects, that infest trees and crops, which, if permitted to multiply, would devour every green thing, and blast the labor of the husbandman. So far from regarding birds as our enemies, we should treat them as our best friends, and put up boxes for them to live in, and be willing to share with them the luscious fruit, to a part of which they are justly entitled for the benefits they confer upon us. In confirmation of these views, I forward for publication part of a letter from Cassius M. Clay, of Kentucky, which is extracted from an agricultural paper:—

Monroe county, Pa., 7th mo. 30th, 1859.

At daybreak, I estimate that 400 songsters break forth into one grand jubilation of mingled song, on my 30 acres of fruit and pleasure grounds. Among these I note the cat bird, the thrush, the blue, black, and red birds, the bell martin, the dove, lark, and quail, the sparrow and humming bird, robin and jay, the house porch and barn swallows, and many varieties of orioles, woodpeckers, sapsuckers, &c.

To-day, my mind running upon the use of birds, I took my position about 15 feet from the nest of an oriole, built in the top of a peach tree 12 feet high, to observe their habits. The nest is formed of blades of blue grass, worked into a basket form, the limbs of the peach tree acting as braces. This variety has the female of a dusky bluish yellow—the male black headed, and blackish wings, with a brick-dust or robin redbreast color on the breast and sides. There are four young ones, well fledged, which every now and then stand upon the edge of the nest, and try their wings. I lay down upon the greensward a long time, and observed the movements of the parents, with my watch in hand. They made a visit with food about every four minutes on an average, varying in time from two to six minutes. They would light upon the black locust trees, the vine, the grass, and other places, clinging at times to the most delicate and extreme points of the leaves. I observed plainly green and brown grasshoppers, caterpillars, and small flies; sometimes one, and sometimes as many as six were

fled to the young ones, whose heads I could see above the nest. They would also carry back the refuse litter from the nest, dropping it 50 yards or more off! which same thing I saw the brown thrush, which has a nest in a climbing rose about 40 yards off, also doing, they having also four young ones.

INSECTS.

2 birds making a visit every 4 minutes = 1 in 2.
60 minutes divided by 2 = 30 visits in an hour.
4 worms on an average = 120 worms to the hour.
6 working hours = 720 a day.
200 pairs on the grounds = 144,000 a day.
200 pairs in 30 days = 4,420,000 a month.
200 pairs in 8 months = 353,600,000.
200 pairs old ones, do. by 2 = 707,200,000 in the season.
400 crows, do. by 2 do. = 1,414,400,000.
400 do. eating 4 times, by 4 = 5,657,600,000.
Crows and birds together = 6,384,800,000.
Double the estimate of birds and crows, which I think fair on my farm, and we have
 $6,384,800,000 \times 4 = 25,459,200,000.$

That is to say, *twenty-five billions, four hundred and fifty-nine millions, and two hundred thousand caterpillars and other insects destroyed in one year!* If these estimates seem large, we must remember that the circulation and respiration of birds are extremely rapid; and of course the consumption of food rapid in proportion.

Here is no "sickly sentimentality," but plain economical facts based upon observation. Shall we spare the crows and other birds a little corn and fruit; or shall we kill them, and revive the famines of the East and the ravages of other days? Shall we fire on them in the morning, or join in their universal jubilation?

Madison county, Ky. C. M. CLAY.

SOME EXPRESSIONS OF EZEKIEL CONGDENS,
A colored man who had been a slave of Warner Mifflin.

Though expressed with great simplicity, they will no doubt be read with interest.

I think it will do my mind good to tell you that I had a great many thoughts of seriousness come over my mind since you have been here, and I want to tell you how I came to think good. When my master set me free, and I worked on my master's farm, when I was at the plow, the good spirit of God came into my heart, and showed me I did not live a good life, and then I was very sorry and I think I do better. Then I forget all the world, and I plow a great way, and I look back and wonder how I plow so straight, and then I see how I live all my life long, and I think now I live better. Then I look and see a great many black people do wickedness, then I tell them it is not right, and if they do good then their masters set them free; then I tell my master (Warner Mifflin) what I see, and we both set down on the step and cry; and my master tell me I should go to some place of worship;

and I say master, I think it not so much matter what place of worship I go to, so I live right every day; and so I live along. And when I lay down at night I think how I get a living for my family, and feel poor, and want to feel better, the good spirit of God comes into my heart, and then I pray God to keep me in the low valley of humbleness, and then I feel all quiet, and good and peace comes into my heart.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, EIGHTH MONTH 13, 1859.

The memoir of E. T. King has been sent us by our friend Uriah Hunt.

The subject of this memoir was not a member of our branch of Society, but as it has been our custom to glean from every vintage, we call the attention of our young friends to some precious extracts from its pages, which will appear, continuously, for a few weeks in our paper.

The book can be obtained at No. 62 N. Fourth street, Philadelphia.

DIED.—In Berwick, Columbia county, Pa., on the 20th of 6th month, after a severe illness of a few weeks, MARY ECK, in the 49th year of her age, a member of Berwick Monthly Meeting. She felt fully resigned to her Master's will.

—, In Mount Pleasant township, Columbia county, Pa., ELIZABETH HEACOCK, wife of Amos K. Heacock, on the 31st day of the 5th month, 1859, in the 29th year of her age, after a short and severe illness, which she bore with Christian fortitude. Her peace being made with her Heavenly Father, she expressed a desire patiently to await the end.

—, On First day morning, 7th inst., MARGERY M. ROWLETT, in the 55th year of her age. She was a member of Philadelphia Monthly Meeting.

—, In Philadelphia, on the 28th inst., ESTHER, widow of Joseph Ridgway, in the 77th year of her age.

If the rational family would live the peaceful, quiet life she has led, doing her duty to her family, her fellow creatures and her God, this world would be the Eden it was intended to be. The mother of thirteen children, all of whom she raised to man or womanhood, the writer of this, her eldest, never remembers seeing her in a passion. Her intercourse with all was ever marked by mildness and kindness.

VISIT TO AN INDIAN TRIBE.

Among the same papers in the hand writing of Isaac Parry was found the following, entitled "Extracts of a letter from Haldy Jackson, dated *Genesinguhtha, 5th mo. 26th, 1799.*"

I believe could we prevent the introduction of that baneful article, s rong drink, amongst them (the Indians) a rapid progress would be made in the work of civilization. Many of them have

been at the frontier settlements this Spring, to dispose of their skins, furs, etc., and have got fresh supplies of liquor from them, with which they have been much intoxicated, and one or two women ended their lives by it. We felt some engagement of mind to have them generally collected in Council, which was accordingly held at Cornplanter's village near two weeks ago, and although many of them were so intoxicated they were not fit to attend, yet those who did attend were their principal men, and we were favored to point out to them the evil consequences attending the use of so much whiskey, and the misery to which they were subjected by it, as it drained them of almost all their money and skins, which they ought to lay out for more useful articles; also explained to them the many advantages attending a life of civilization and temperance, contrasted with the hardships, fatigue, hunger and cold which they must necessarily endure to procure sustenance in their former way of living. I believe many of them were convicted in their consciences, and I never before saw them so solid in a council; they have had much counselling among themselves, respecting what we said to them, and I understand they have made a law, that not one of them shall be permitted in future to bring liquor into their village to sell to the others; and what they had on hand they have given up to one of their people, to give them a dram only as he thinks they stand in need of it; and also that they have concluded to help their women about raising their corn this Summer.

When I consider the inflexibleness of some, even in our Society, who contend for the practice of distillation, and the common use of those destructive liquors, I can scarcely think it too uncharitable to say that such are sinning against light and knowledge; and when I compare their situation with the ignorance and darkness that prevails among those inhabitants of the wilderness, respecting a future state, it brings to my remembrance that scripture testimony on something of a similar occasion, that if one half the pains had been taken with these poor people, that has been taken with some in our Society, "they would have repented long ago in sackcloth and ashes."

I sometimes think that no mind possessed of the feelings of humanity, and concerned for the good of society, could be instrumental in promoting the distillation of that which destroys such numbers of the human race. Great are the two evils, "Drunkenness and Infidelity" that abound in our land, and will, I fear, if continued in, draw down national calamities on the inhabitants of the earth.

He that pleads some trifling excuse for the nonperformance of a known duty to-day, will be satisfied with an excuse still more trifling to-morrow.—*Congregationalist.*

FEMALE INDUSTRY.

(Continued from page 331.)

This leads us on to the class of manufacturing operations which can be carried on by women in their own homes. As the era of female industrialism has set in, indisputably and irreversibly, it is of the utmost importance to contemplate this phase of it, and to assist it as far as possible:—which means to relieve it from oppression and hindrance. We need say nothing of the ordinary 'woman's work' which may be done at home,—the needlework of various kinds; nor of the weaving which men have long ceased to oppose. But there are arts to which female faculties are particularly appropriate which women cannot practise on account of the monopolising spirit of the men. Take the watch-making business as an instance.

Watches are so dear in this country that laboring men, the working-classes generally, and young people of all but the wealthy orders, are placed at a disadvantage about the use and economy of time from the absence of the means of measuring it. The dearness of watches is proved to be a gratuitous evil, imposed by the mistaken selfishness of a small class of the community. In this country 186,000 watches per annum are manufactured; and, as this goes a very little way towards supplying the demand, there is a large importation from Switzerland,—exceedingly profitable to somebody at our expense, as the price of the article is kept up by the artificial scarcity at home. Now,—who makes the watches that we import?—In the valleys of Switzerland, in the cottages on the uplands, in the wildest recesses that men can inhabit, as well as in the streets of the towns, there are women helping to make watches. We are told that 20,000 women are actually so employed. Why not? The metal in the inside of a watch costs about sixpence in its unwrought condition. By the application of the fine touch so eminently possessed by women, guided by their fine sight and observation, that sixpenny worth of metal is so wrought and adjusted as to become worth several pounds. If there are 20,000 Swiss women at work at their own windows, with their children about them, and their husband's dinner at the fire, making watches for Europe and America, why are there not 40,000 Englishwomen helping the family independence in the same way? Simply because the caste or guild of watchmakers will not permit it. We need not explain to our readers that the monopolists punish themselves, as well as the public, and tens of thousands of our countrywomen. In Switzerland, the greater the number of women so employed, the greater the number of men also. By simply meeting the demand for watches at home, and yet more by preparing a due supply for America and our own colonies, our watchmakers would open a new vein of employment and profit for themselves and their

households. Instead of this, what do they do? One case which fell under our own knowledge, is this:—The wife of a respectable watchmaker wished, as did her husband, that she should work with him at his special division of the manufacture: but they dared not attempt it under the eyes of the craft. She therefore engraved the 'brass work,'—a commoner and easier kind of work. As soon as the fact was discovered, an outcry was raised, and intimidation was tried to drive her from her occupation. She kept her husband steady to their household plan: but it was only by permitting their friends to set up a plea of apprenticeship, on the ground of her father having been seen to do that kind of work in her presence, that she obtained any peace and quiet. She brought up her two daughters to the business, while training them in housewifery as well. By this time we hope many daughters and sisters are seen, as we have seen a few, enamelling the faces of watches, polishing them, inscribing the hours, and conducting the nicest mysteries of the art. If it is true, as we are assured, and as may well be, that the parts of watches made by Swiss women are imported into this country, it seems impossible that our countrywomen should be long excluded from that province of industry. It seems incredible that some thousands of foreign women should be supported by making watches for us to buy dear, while thousands of needlewomen should be starving in London, for want of permission to supply us with cheaper watches. Mr. Bennett's exertions seem to be making the case clear to an increasing number of the public; and the time cannot be far distant when the tyranny of a virtual guild will be overthrown, like that of so many actual guilds. As for the mode in which the change will be made,—we may obtain a hint from the Swiss. The watchmakers are an educated class; and the more highly they are educated the better are the watches they produce. The fact appears to be undisputed; and the lesson is sufficiently plain.

This last topic would naturally lead us to consider other arts, requiring a higher education, which women have found it difficult to get leave to practice: but we must first devote a few moments to the miserable class of poor needlewomen—whether the makers of shirts and trowsers, or of gowns and petticoats. The sempstresses are returned as nearly 61,000 at the time of the last census; and the milliners and dress makers as nearly half a million.

The wretched dependents on the slop shops are suffering under the last struggles of their art with the improvements of the time. We see the sewing-machine coming into use. It will do great things; and it will bring in further methods which will extinguish the craft of the poor needle-woman. Already we hear of more than one establishment in London which uses seventy

of these machines, each of which dispatches as much work as fifteen pairs of hands; and of provincial shops, where the introduction of one machine has caused the dismissal of thirty women and girls. At first, it was supposed that only long rows of plain work could be done in this way; but now we hear of shirt collars, gloves, and other delicate pieces of stitching being done, as well as saddlery and harness making, and shoes. Both the needle and the awl are largely superseded by it; and it can be managed even by young children. Thus is the case of poor needle-women to be solved! They can scarcely be worse off than at present; and if the change should reintroduce the art of genuine sewing, our country-women will have reason to rejoice. At present, we hear it said, that the art of sewing seems well-nigh lost in England, except among the ladies who have a taste for it, or who were trained by an unfashionable grandmother. The superiority of French *lingères* to English sempstresses is most remarkable, and proves that the handiwork of sewing is far better taught and practised in France than in England.

No machinery can supersede sewing altogether, though it may, and ought to, extinguish slop-making at fourpence a day: and whereas scarcely a good sempstress can now be obtained, for love or money, we may hope to witness so much restoration of the art as is needed for economy and neatness. It is not desirable to wear out eyes, and spend precious time in marking letters, with a fine needle and colored thread, on a cambric handkerchief, when we are in possession of marking inks, and practised in drawing with a free hand: but we must have a release from the ragged edges, loose buttons, galling shirt-collars, and unravelled seams and corners which have come up as the quality of needlewomen has gone down. Let our wives undertake the case of the remnant of the poor sempstresses—the last, we hope, of their sort. Many may be retained for the management of sewing machines. Many may emigrate, under careful arrangements. The younger may possibly be even yet taught to sew properly, or to do something else that is useful; and all might, by a sufficient and well-concerted effort, be kept out of the hands of the middleman. That department of the industrial market is undergoing vital changes.

To return to the difficulties created by the jealousy of men in regard to the industrial independence of women:—it shows itself with every step gained in civilisation; and its immediate effect is to pauperise a large number of women who are willing to work for their bread; and we need not add, to condemn to perdition many more who have no choice left but between starvation and vice. The jealousy which keeps Coventry women from the employment of engraving the brass work of a watch, and from pasting patterns of floss-silk upon cards, for trade purposes, long

kept the doors of the School of Design in London closed against female pupils, and renders it still almost impossible for an Englishwoman to qualify herself for treating the diseases of women and children. The same jealousy cost many lives in the late war, by delaying the reception of the nurses into the hospitals in the East, and by restricting their action when there. In the Staffordshire potteries women are largely employed in painting porcelain—an art which they are better qualified to practise than men. It will hardly be credited, but we can vouch for the fact, that such is the jealousy of the men that they compel the women to *paint without a rest for the hand*, and the masters are obliged by their own workmen to sanction this absurd act of injustice.

The immediate and obvious consequence is, that women who must earn their bread are compelled to do it by one of two methods—by the needle or by becoming educators. Often and emphatically as this has been said, we must say it again in this place; but we need not go into the description either of the miseries of needlewomen or of the tremendous mischief done by driving shoals of incompetent persons into the ranks of educators. Good and qualified governesses are as sensible of the evil as the employing class; and they are perhaps as keenly afflicted by it. The only certain remedy is to leave open every possible way to employments of the most various kinds that are suitable to the abilities of women. The merely incompetent instructress would never have placed herself in a position so painful and precarious, if a way had been open to support herself by something that she could do better. The injury to the qualified governesses is cruel. The reputation of the whole class suffers by the faults of its lowest members; the emolument is depressed, first by the low average quality of the work done, and again by the crowded condition of that field of labor. The wretched condition of many of these unfortunate persons can hardly be exaggerated.

One way out of the desperate position is obvious and open. It is now a recognised truth that education is an art requiring instruction and training, as much as the function of the physician, and the lawyer; and the unprepared are cast out, more and more every day. The immediate misery thus caused is dreadful. It is that of the hand-loom weavers, and the slop-makers, with the aggravation that the sufferers are, generally speaking, gentlewomen by birth, and universally accustomed to the comforts and many of the luxuries of life. It would open a dismal chapter to show how many of them have reversed the old rule of woman's destiny,—that of being supported by father, brother or husband,—having given all their earnings to pay a father's debts, to sustain an idle or struggling brother's professional appearance, or to indulge the vices,

or to neutralise the shiftlessness, of a husband. Facts seem to show that the proportion of governesses who have the advantage and use of their own earnings is very small. Instead of such just and pleasant results of their industry as a small independence at a time of life when some power of gratuitous usefulness and of enjoyment of ease is left, we read, till sheer pain of heart stops us, of the cases which come before the Governesses' Institution:—old age, or impaired health in middle age, amidst perfect destitution; failing sight, paralysed limbs, over-wrought brain, and no resource or prospect whatever; though (or because) the sufferers have supported orphans, saved a father from bankruptcy, educated brothers, or kept infirm and helpless relatives off the rates. We need not go on. The evil is plain enough. The remedies seem to be equally clear;—to sustain and improve the modern tests of the quality of educators; and to open broad and new ways for the industrial exertions of women, or at least to take care that such as open naturally are not arbitrarily closed.

The function of industry which might be supposed to be always standing wide for women is not in fact so,—the nursing function in all its directions, in private dwellings, in work-houses, in hospitals and in lunatic asylums, where it is at least as much wanted as anywhere else. We shall not argue it, or plead for it here. Florence Nightingale and her disciples have inaugurated a new period in the history of working-women, and the manifest destiny of the nursing class will fulfil itself.

There may be more difficulty about the kindred function,—that of the physician and surgeon: but it cannot long be a difficulty. The jealousy of the medical profession is, to be sure, proverbial: but it is not universal. From our youth up, some of us have known how certain of the wisest and most appreciated of physicians have insisted that the health of women and their children will never be guarded as it ought to be till it is put under the charge of physicians of their own sex. The moral and emotional considerations involved in this matter need no discussion. What had been done in the most advanced of the United States of America, where social conditions most nearly resemble those of England, shows what will be done here, and very soon. Some of the medical colleges have, after long opposition, or protracted deliberation, admitted ladies as students, and have conferred degrees; so that several of the cities have the blessing of highly qualified female physicians. The thing could not have been done without the sanction and practical encouragement of some of the first professional men in the community. That sanction and encouragement have been freely rendered, and are still continued, so that there is now a history of the change to be told. There are charters and grants of money by state legislatures for dispen-

saries, and medical colleges, and attendant hospitals, for the training and practice of female physicians, an increasing number of whom are established in the great cities from year to year. Dr. Elizabeth Blackwell, whose excellent work on the 'Laws of Health' is one of the list which beads this article, led the way; and by the influence of her high character, attainments, and success, she has conquered prejudice, and established the enterprise. In our country, more time will, no doubt, be required. Prejudices are stronger; the capabilities of women are less tested and understood; and social service is not so earnest as in the younger country; but, if English physicians two generations ago desired and foretold the change, it is for us to reckon confidently on it. In the branch of practice too much encroached upon by ignorant poor women, a few desultory efforts have been made, with no other success than preparing the way for more. Mrs. Hockley was a professional accoucheur for many years, and in excellent reputation. Dr. Spencer, of Bristol, educated his daughter for the same office; but the prejudice was too strong for her endurance, and she entered the ranks of governesses, where her honor and success indicated what her career as a physician might have been. The institution of the medical profession as a career for women in any one country facilitates its opening every where else; and we have no doubt whatever of the approaching conversion or supersession of such opponents as would deny the means of special training to educated women who demand it.

To be continued.

THE TRADE IN PALM OIL.

The resolution introduced into the Senate lately, to inquire into the number of vessels engaged "in the palm oil trade on the coast of Africa," probably called the attention of many, for the first time, to this branch of our commerce. We give some items of interest connected with the history of this new and growing traffic.

India rubber, gutta percha, and palm oil, have made revolutions in trade within the last few years. They have all inaugurated a new era in the world, but the most important changes wrought by these three productions of the tropical clime, must be attributed to *palm oil*. It has not only entered as a new staple upon our commercial lists, but has had a direct moral bearing upon the welfare of millions. It has done more than men-of-war to diminish the victims of the African slave trade.

Of the six hundred different kinds of palm trees, several score furnish oil-bearing nuts, and wax-giving leaves. Southern Asia, almost all parts of Africa, tropical America, and the Islands of the Indian Ocean afford these prolific trees. The palm oil tree of Western and Central

Africa, however, is the most fecund in the oleaginous qualities, though its congener, found in Brazil, New Grenada and Venezuela, under the name of *Elaeis melanocca* and *Corozo colorado*, has not yet had fair play so far as commerce is concerned. The *Elaeis Guineensis* is the palm tree whose oily product has called the attention of our Legislature. It has a number of ovate-angular, one seeded fruits, known to botanists as drupes, *i. e.* like the plum, the olive, &c. These fruits, or nuts, are covered with oily husks of a bright vermilion, or, sometimes, of a yellow color. The natives boil these in water, and the oil floating to the surface is skimmed off into calabashes, or large gourds, and is thus taken to the European factories. Within the last few years, the gathering, preparing and bringing the oil down to the coast, have employed very large proportions of the population in the districts where the *Elaeis Guineensis* grows. In 1848, the British Parliament ordered an investigation in regard to the value of this trade, as well as to the possibility of civilizing Africa by means of this legitimate traffic.

African palm oil had long been sought after by Europeans, but it did not begin to assume that importance which it now holds, until the introduction of new processes for manufacturing stearic candles from this oleaginous substance. By the invention of these modes of dealing with palm oil, the trade in it increased to such dimensions that in 1855 no less than 20,000 tons of shipping from Liverpool alone, were engaged in transporting it to England.

The late William Hutton, before the Parliamentary Committee, stated that the palm oil traffic is a barter trade—that the oil was almost entirely paid for in the manufactures of Manchester, Birmingham and Glasgow; that the people are most numerous engaged in its preparation; that it is brought down to the coast in small quantities and sold even in single gallons; that the natives keep no store, but bring it as it is manufactured; and that he considers it an indisputable fact that the legitimate trade and produce of Africa are in every respect the most desirable means that can be applied to the suppressing of the slave trade.

William Jackson, before the same committee, testified, (more than ten years ago,) that palm oil is a produce that may be indefinitely multiplied; that it is impossible to form an idea of what Africa can do; that he thought “we are only in our infancy with regard to the trade with the West Coast; that what we import now is a mere *bagatelle* to what we shall be able to do in the course of a few years; that from his experience of the trade, and seeing the way that increase has taken place according to the demand for it on the coast, he considers that there is no end to the quantity of palm oil that can be produced, and that he is corroborated in this by

every trader he has come into contact with, who has been out to the coast of Africa, from whom he has always heard the opinion that the demand will always be met by a supply, although there may be occasionally a little delay in consequence of the demand coming suddenly when their season is not on.”

Wm. Jackson, in answer to the question as to what kind of goods were used in barter, stated that “fancy articles, such as beads, looking glasses and other nick-nacks” were first employed, but that they had developed taste and desires of the black, and gradually led him into habits of civilization. The Chairman of the committee asked Wm. J. if in this trade they had not commenced with beads and had finally induced the Africans to adopt the garments and costume of civilized people. Wm. J. replied, that the progress was even greater than this supposition. “I recollect,” he continued, “that the last year I was in the trade we sent out to King Eamen, of Old Calabar, a house to cost nearly \$5,000, which was paid for in palm oil.”

Dr. Kehoe, before the same committee, stated that he had resided a year on the West Coast of Africa; that he had greatly turned his attention to the means of promoting civilization there, and had made inquiries from all persons who trade upon the coast, both natives and resident merchants. “He had not the least doubt that civilization would, in the course of time, be enormously promoted by legitimate trade; or that any amount for which we had a demand, whether of palm or other vegetable oils of a similar kind, could be produced. That he had no doubt that it would be a most important means of gradually civilizing the inhabitants and checking the slave trade. That a naked savage, who has been taken out of a slaver, after passing a few years at Sierra Leone, becomes a consumer of almost every European article.” He also stated that, from his knowledge of the character of the natives, he thinks that we have every reason to hope that they will go on progressing in civilized tastes, and that every additional tun of palm oil that is exported is a blessing to Africa, as tending to assist this progress.

In Captain Forbes' interesting “Dahomey and the Dahomans,” there is more than one reference to this subject. He says, “the inhabitants of a vast extent of coast have been led to give up the slave trade, and why? Because they have been taught the immense increase of the value of the palm oil trade over that in slaves.”

We might multiply testimony on this subject, but the above will suffice. We shall soon recur to this interesting and growing trade in palm oil. We cannot, however, close this article without recording our gratitude, that light in regard to Africa begins to loom in the distance. The increase of legitimate traffic, the investigations of Livingstone, the discoveries of higher lands, like

the Yoruba country, all these indicate that the regeneration of Africa will yet be in her own hands.—*Journal of Commerce.*

THE LAW OF LOVE.

2 Kings iv. 3.

Pour forth the oil—pour boldly forth,
It will not fail, until
Thou fallest vessels to provide,
Which it may largely fill.

Make channels for the streams of love,
Where they may broadly run,
And love has overflowing streams
To fill them every one.

But if at any time we cease
Such channels to provide,
The very founts of love for us
Will soon be parched and dried.

For we must share, if we would keep
That blessing from above;
Ceasing to give, we cease to have,
Such is the law of love.

R. C. TRENCH.

ADDRESS TO THE DEITY.

BY MILTON.

These are thy glorious works, Parent of good,
Almighty! thine this universal frame,
Thus wondrous fair; thyself how wondrous then!
Unspeaking, who sitt'st above these heavens,
To us invisible, or dimly seen
In these thy lowest works; yet these declare
Thy goodness beyond thought, and power divine.
Speak, ye who best can tell, ye sons of light,
Angels; for ye behold him, and with songs
And choral symphonies, day and night,
Circle his throne rejoicing; ye in heaven;
On earth, join all ye creatures to extol
Him first, him last, him midst, and without end.
Fairest of stars, last in the train of night,
If better thou belong not to the dawn,
Sure pledge of day, that crown'st the smiling morn
With thy bright circlet, praise him in thy sphere.
Thou sun, of this great world both eye and soul,
Acknowledge him thy greater; sound his praise
In thy eternal course, both when thou climb'st,
And when high noon hast gained, and when thou
fall'st.

Moon, that now meet'st the orient sun, now flit'st
With the fixed stars, fixed in their orb that flies;
And ye five other wandering fires, that move
In mystic dance, not without song, resound
His praise, who out of darkness called up light.
Air, and ye elements, the eldest birth
Of Nature's womb, that in quaternions run
Perpetual circle, multiform, and mix
And nourish all things; let your ceaseless change
Vary our great Maker still new praise.
Ye mists and exhalations, that now rise
From hill or steaming lake, dusky or gray,
Till the sun paint your fleecy skirts with gold,
In honor of the world's great Author rise;
Whether to deck with clouds the uncolored sky,
Or wet the thirsty earth with falling showers,
Rising or falling still advance his praise.
His praise, ye winds, that from four quarters blow,
Breathe soft or loud; and wave your tops, ye pines,
With every plant, in sign of worship, wave.
Fountains, and ye that warble as ye flow,
Melodious murmurs, warbling, tune his praise.

Join voices, all ye living souls, ye birds,
That singing, up to heaven's gate ascend,
Bear on your wings and in your notes his praise.
Ye that in waters glide, and ye that walk
The earth, and stately tread, or lowly creep;
Witness if I be silent, morn or even,
To hill or valley, fountain or fresh shade,
Made vocal by my song, and taught his praise.
Hail, universal Lord! be bounteous still
To give us only good; and if the night
Have gathered aught of evil, or concealed,
Disperse it, as now light dispels the dark.

From the Quarterly Review.

SHIPWRECKS.

In a recent number of the *Living Age* there appeared a very interesting inquiry into the number and causus of Wrecks and Casualties which occurred on and near the Coasts of the United Kingdom during the year 1857. The total loss of vessels from all causes amounted to four hundred and thirty-seven, and the lives of eight hundred and forty-eight persons were sacrificed.

The Marine Insurance is mentioned as the chief destroyer. "Unseaworthiness and overloading of vessels, their being ill found in anchors, cables, sails, and rigging, defects of compasses, want of good charts, in competency of masters, may all be attributed to this source. If the ship-owners were not guaranteed from loss, they would take more care that their vessels were seaworthy, commanded by qualified persons, and furnished with every necessary store."—ED.

From the chief moral, or rather immoral, cause of shipwreck and loss at sea, we pass to a consideration of the physical agents which act directly in producing these disasters. Of these there are so many, and of such various natures, that it is difficult to group them. Currents of the ocean, fog, lightning, icebergs, sandbanks, water-logged ships, defective compasses, and imperfect charts, are all dangers which beset the path of navigators, and especially of such as have to run the gauntlet in ill-found ships. The effect of currents in taking the sailor out of his reckoning is an old, and formerly perhaps a frequent cause of shipwreck. This source of danger is now much obviated by the more intimate knowledge we are acquiring every day of the general laws which produce the currents. One of the most effectual as well as simple methods of detecting surface currents is that known to seamen as the Bottle experiment. This has been practised since 1808, but more especially of late years, and has been deemed of sufficient importance by the Admiralty to justify an order by which all Her Majesty's ships are enjoined to throw bottles overboard containing a paper, on which is noted the position of the ship and the time the frail messenger was sent forth on its voyage. The

bottle, carefully sealed up, traverses the ocean wherever the winds and surface-drift may carry it, and, after a passage of longer or shorter duration, is perhaps safely washed by the tide upon some beach. Without doubt many are smashed upon the rocks, others again are sunk by weeds growing to them, some are destroyed by the attacks of birds or the jaws of hungry sharks, or if by chance they avoid all these dangers, they may be consigned to oblivion upon an uninhabited shore. It is estimated, however, that at least one-tenth are recovered. A collection of upwards of two hundred has been made at the Admiralty, and are laid down in a chart called the Current Bottle-chart.

A single glance at this chart displays the principle well known currents of the Atlantic ocean. The general tendency of the bottles to go to the eastward in the northern parts of this sea, and to the westward in lower latitudes, is at once apparent. It is equally evident that to the southward of the parallel of forty degrees north on the eastern side of the Atlantic the bottles drift to the southward, while those again in the vicinity of the Canaries and Cape Verd Islands take a westerly direction. Those further south, lose themselves among the West India Islands, and some penetrating further are found on the coast of Mexico, between Galveston and Tanessied. A few manifest the effects of the counter-current of the celebrated Gulf-stream, while others again, on the western side of the Atlantic, from about forty degrees north, are set to the eastward. Indeed there seems to be a determination of all to the northward of the parallel of forty degrees, or that of Philadelphia on the American seaboard, to make their way to the eastward—some to the coast of France, in the Bay of Biscay, others to the western shores of Great Britain and Ireland, and others again to the shores of Norway.

We thus recognize distinctly, first the Portugal current, setting southward; then the equatorial current, influenced by the trade winds; then the extraordinary effects of the waters of the Gulf-stream flowing northward along the American coast, over the banks of Newfoundland—one portion following its north-east course and penetrating to Norway, and another continuing easterly into the Bay of Biscay. But let us particularize a few of the remarkable journeys made by these glass voyagers over the deep. The *Prima Donna* was thrown over off Cape Coast Castle, on the west coast of Africa, and after a voyage of somewhere within two years was found on the coast of Cornwall. Now to have arrived there it must have been carried eastward by the well-known Guinea current, and reaching the Bights of Biafra and Benin it would meet the African current then coming from the southward, with which it would recross the equator and travel with the equatorial current through the West India Islands, and getting into the Gulf stream

would be carried by this to the north-east, and thus would be landed on the Cornish coast, after making a detour of many thousand miles.

But, curious as this is, it is not the only instance, for we find that the "Lady Montague," setting out in nearly eight degree south latitude, about midway between Brazil and Africa, a position which would fairly place it in the equatorial current, made the same voyage, but landed at Guernsey, having accomplished the course in two hundred and ninety-five days, or between the 15th of October, 1820, and the 6th of August, 1821. Confining ourselves now to the area included between thirty degrees north latitude and the equator, the general effect of the heat of the Gulf of Mexico in forcing the waters thither is plainly indicated by the direction which the bottles have followed that are included within those limits. Those thrown overboard in the Mexican Gulf, to the north of Cape Catoche of Yucatan, are hurried away with it and cast on the American shore, near St. Augustine and Charleston. Other instances show the effects of the counter current of the Gulf stream on its eastern or ocean side, in driving bottles to the south-east, a current that must have affected the ships of Columbus in his first discovery, and which, upon his return northward among the islands, without doubt, met and opposed his progress.

A curious example of the effects of the wind on the surface-waters is shown by a bottle thrown over from H. M. S. "Vulcan" in the midst of the Gulf-stream, about one hundred and thirty miles southward of Cape Hatteras. The ship was on her way to Bermuda, where she arrived, and the bottle, instead of being carried by the current to the north-east like others, actually went after her and arrived at Bermuda also. But we find noted on the paper that a strong northerly wind was blowing when the bottle started. This must have been sufficient to have checked its progress to the north-east, but allowed it to approach the eastern border of the Gulf-stream, whence it would drift into the eddy or counter-current, and thus became thrown on Bermuda. Again, between the Gulf-stream and the American coast, bottles have found their way to that shore, while those to the northward of the parallel of forty degrees have invariably gone eastward; and many thrown over near the meridian of twenty degrees have drifted into the Bay of Biscay, and been cast on the French coast.

Among the numbers of bottles which have travelled westward with the equatorial and tropical current, two are remarkable, as being thrown overboard about seven hundred miles from each other, and yet arriving at nearly the same destination. They were thrown from sister-ships when on their errand of carrying relief, by way of Behrings Straits, to Franklin and his devoted crew. The first was dropped from the "Investigator," Sir R. Maclure, in lat. twelve degrees,

lon. twenty-six, the 27th of February, 1850, and was found on the 27th August following on Ambergris Cay, on the Yucatan coast; the second was sent afloat on the 3rd March, 1850, by Captain Collinson, in the "Enterprise," in lat. one degree north, lon. twenty-six degrees west, and drifted to the coast inside of that cay, about thirty miles to the northward of it. That the two bottles should take their western course was to be expected; but that they should have gone to resting-places so near each other is singular, considering that their points of starting were so far asunder.

The Gulf-stream, the limits of which are so clearly intimated by these little messengers, is but a sample of a grand system of currents which are produced by the unequal temperature of the different zones. These currents of hot and cold water are accompanied by atmospheric changes equally extraordinary; and, taken together, they largely affect the course of the navigator from the old to the new world, and not infrequently are the cause of the most fearful shipwrecks.

(To be concluded.)

A CARD. TO FRIENDS.—It is known to you that Samuel M. Janney and myself have recently issued proposals for the publication of our respective books. The idea seems to prevail that the said works will be very similar in character, and a fear has been expressed that it may injuriously affect the subscriptions to both. I therefore deem it proper, in justice both to Samuel M. Janney and to myself, to say that the character of the works is entirely distinct, and their design essentially different. So far as I can judge, they do not occupy common ground—nor can they supply the place of each other. EZRA MICHENER.

New Garden, 7th month 30th, 1859.

ITEMS OF NEWS.

FREE PERSONS SOLD AS SLAVES IN MARYLAND.—Three colored persons were tried and convicted last week, in the Circuit Court of Frederick County, Md., of the crime of enticing slaves to run away from their masters. The *Citizen* says: They were sentenced by the Court, in accordance with a law recently passed by the Legislature, to be sold out of the State as slaves for life. The proceeds of sale to be applied—first, to cost of prosecution; secondly, to indemnify the masters of the runaways for their loss; and the balance, if any, to be given to the families of the convicted parties.

RELIGIOUS LIBERTY IN LOMBARDY.—The Paris Press says:—The Governor of Milan, representing Victor Emmanuel, has proclaimed liberty of worship, reading, and printing. This is no ordinary privilege. It will do more to prevent the reflux of Austrian domination and sacerdotal intolerance than treaty or army or battlements. It will give the people a taste of enjoyment which it will be almost impossible entirely to eradicate at any future time, because the longer it lasts, the more extensively and firmly it will interlace and incorporate itself with the very life of the people. What is worthy of remark in this instance is the fact that this is not a Protestant insurrection against a Roman Catholic institution, resting its right on sacred Scripture, and deriving its growth from the overthrow

of Roman dogmas, but a purely civil right enacted by Roman Catholics, for the use of Roman Catholics. These have demanded and vindicated it as a political necessity of national existence.

STEAM PLOW IN ENGLAND.—At the meeting of the Royal Agricultural Society in Warwick, England, July 12th, a prominent feature of the exhibition was the collection of steam plows and steam cultivators. Sixteen steam plows were entered for competition, and ten steam cultivators, the last named being intended for cutting and thoroughly pulverizing the soil to the depth of six to nine inches along a track four and a half to five or six feet wide. The Manchester Guardian says that "the most peculiar and novel implement exhibited under this head is Romaine's patent steam rotary cultivator, which professes to perform perfect spade husbandry, digging six acres a day at nine shillings (\$2 16) per acre. The machine is very cumbersome and unwieldy, weighing ten tons, but it does not require any assistance from horses, as it is self propelling."

OPENING OF A BRIDGE OVER THE NILE.—A letter from Alexandria, of the 11th ult. says:—There was a grand fete—what the Arabs expressly call a fantasia—at Kafr-e-leia last week, on the occasion of the opening for traffic of the splendid iron bridge thrown across the Nile there, over which the railroad to Cairo passes.

DRY SPELL IN INDIANA.—The grass has become so dry in some portions of Indiana, that it catches fire from the sparks of the locomotives. On the Terre Haute road, ditches have been cut near the track to check the flames and prevent their consuming the ties of the road. At several places on the Bellfontaine road the trains have been forced to stop, and extinguish the fires.

GREAT DESTRUCTION OF FIREWOOD.—A few days since, 200,000 cords of wood, piled alongside the Little Miami (Ohio) Railroad, were destroyed by fire, and the rails were so warped by the heat that trains were delayed for several hours. A few days previous to this wholesale burning, 150,000 cords of wood, belonging to the same company, were destroyed in the same way.

THE SUSPENSION BRIDGE.—A letter from Niagara Falls, N. Y., says that where the suspension bridge originally sagged only two or three inches under the weight of a train, it now sags nearly twenty inches. The general impression in the neighborhood is, that this great work of art will give way some day, and fall into the river.—*Ledger*.

EMIGRATION TO HAYTI.—Respecting the free negro emigration from Louisiana to Hayti, the N. O. *Picayune* says:

"Of the great number of emigrants who left New Orleans, some thirty have returned—many disgusted and discouraged because they had not formed a correct idea of what they were to find there; but others, after surveying the country, and examining what most profitable enterprise could be started there, have come back to purchase machinery, implements, &c., which cannot be had in Hayti, and they are prepared to return, perfectly satisfied with the prospect, and confident of success. So far as white men are concerned, we do not believe that the Haytians desire a large white immigration, though they would welcome useful men, who, whilst building up their own fortunes, would do good to the country by the introduction of practical arts and science. Anyhow, we are assured by those connected with the government that the whites enjoy full security under the protection of the laws."

STEAM ON THE OHIO CANAL. The first attempt to navigate Ohio canals by steam has taken place this

season, and the success has been unquestionable.—The Enterprise, built at Akron, Ohio, has made several trips, it is stated, to and from Cleveland, carrying 60 tons and running at the rate of five miles per hour. The engine is about eight-horse power, has a seven inch cylinder, with twelve inch stroke, and occupies about as much room as the stables for horses on the ordinary boats. She is propelled by a screw.

THE SLAVE EXODUS FROM MISSOURI. The Occidental Messenger, of Independence, Mo., publishes a comparative statement of the Assessor's books of Jackson county, Mo., in which are situated Independence, Kansas City and Westport—from which it appears that the number of negroes (slaves) in that county has decreased 500 in the past year, which is about 17 per cent.

FLORENCE NIGHTINGALE is so extremely ill that the worst results are apprehended. Her strength is diminishing sadly. She has been moved from Highgate to London, but is now confined to her room.

EXTRAORDINARY DROUGHT IN SCOTLAND.—Accounts from Scotland state that the drought during May and part of June was more severe than during any past year since 1826. The rivers Earn and Tay were nearly dry—the famous Doon, would slide through a gallon measure, and other well known streams and rivers were thoroughly dried up. In some places water was so scarce that in villages it was sold for five shillings per barrel and many had to go miles for water for their cattle. The crops, notwithstanding, are reported as looking excellent; and recent rains will no doubt advance them considerably.

ADAMS' EXPRESS.—At the present time, we learn that Adams' Express employs 3782 men; that it has 972 agencies, and that its messengers travel daily 40,152 miles on railroads and in steamers; a distance equal to once round the globe and two-thirds around it a second time.

The exhibition of the steam plow at Oxford near Philadelphia, was numerously attended. The working of the machine gave perfect satisfaction to all present.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market continues very inactive. The receipts are small, but the stock is ample. Old stock superfine is offered at \$5 00 per barrel and fresh ground, new, at \$5 50. The sales to the trade range from \$5 12 to \$5 75 for superfine and from \$6 00 up to 7 00 for extras and extra family, according to freshness and quality. Not much doing in Rye Flour or Corn Meal. The former is held at \$3 75 and the latter at \$3 62 per barrel.

GRAIN.—There is a limited supply of new Wheat, and with more demand prices are firm. Small sales of prime new red at \$1 30 a \$1 33, and choice white at \$1 40 a 1 45 per bushel. Rye sells at 70 cents for new and 78 cts. for old. Corn is dull. Small sales of yellow at 75 a 78c. Oats are firmer; free sales of Pennsylvania at 33c. and 31 cents for new Delaware. Old are wanted at 37 a 37½ cts.

CLOVERSEED comes forward slowly. If here fair and good would bring \$5 75 per 64 lbs. Timothy is worth \$2 50 a 2 75. Flaxseed is selling at \$1 66 per bushel.

LAKE SCHOOL FOR BOTH SEXES.—This School has a beautiful and healthy location on Oneida Lake, N. Y. Board, Tuition and use of books and stationery for twenty weeks, from \$45 to \$50, or from \$90 to \$100 for continuous term of forty weeks,

beginning 26th of 9th month. This school is situated 130 miles west of Albany.

Circulars sent on application to either Proprietor.
SIDNEY AVERILL, or
ELMIRA AVERILL,
8 mo. 13.—3t. West Vienna, Oneida co., N.Y.

ERCILDOUN BOARDING SCHOOL FOR GIRLS.—The seventeenth session of this Institution will commence on the 17th of 10th month next. The terms for English branches and Languages are \$60 per session of twenty weeks. For Catalogues containing particulars, address the Principal.

SMEDLEY DARLINGTON,
8th mo. 13th—6t. Ercildoun, Chester co., Pa.

G WYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month, 1859, and continue twenty weeks. Terms \$70, and no extras. For further information application can be made to

DANIEL FOULKE, Principal,
HUGH FOULKE, Jr., Teacher,
Spring House P. O.,
8 mo. 13—2 mo. Montgomery co., Pa.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.
8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hilborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.
8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pells work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.
Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

PHILADELPHIA, EIGHTH MONTH 20, 1859.

No. 23.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

(Continued from page 339.)

On Salvation by Christ.

John. There are several passages in the scriptures which appear to militate against these views, and to confirm those which I advanced; and I cannot see how they can be explained in any other way. I think Christ is often spoken of as a sacrifice offered to God; it is said, "he was once offered to bear the sins of many." "He hath made him to be sin for us, who knew no sin, that we might be made the righteousness of God in him." "Christ also hath once suffered, the just for the unjust, that he might bring us to God." The prophet Isaiah says, "Surely he hath borne our griefs, and carried our sorrows; yet did we esteem him stricken, smitten of God and afflicted. But he was wounded for our transgressions, he was bruised for our iniquities, the chastisement of our peace was upon him, and with his stripes we are healed. All we, like sheep, have gone astray, we have turned every one to his own way, and the Lord hath laid on him the iniquities of us all." This language must allude to Christ, for the apostle Peter quotes it and applies it to him: "Who his own self bare our sins in his own body on the tree." 1 Peter ii. 24.

Father. It is true that the death of the Messiah is often spoken of as a sacrifice offered to God; but the same term is applied by the apostle Paul to his own expected martyrdom: for he says, "I am ready to be offered." 2 Tim. iv. 6. And again he says, "If I be offered upon the sacrifice and service of your faith, I joy and rejoice with you all." Phil. ii. 17. The same kind of figura-

tive language is still used, but no one ever thinks of taking it literally. For instance, it may be said that many of the reformers *sacrificed their lives* in the cause of truth; and that religious liberty has been purchased with the blood of the martyrs. We all know how to understand this language, and why may we not conclude that the Jews used it in the same sense? It is very obvious that Paul used it in this sense, when he spoke of himself being offered up as a sacrifice.

The other passages which speak of Messiah bearing the sins of many; being made sin for us; suffering for the unjust; and having laid on him the iniquity of all,—will admit of a very different interpretation from that which has been given to them by the advocates of a vicarious atonement, and one that is far more consistent with the Divine character. They do not say that the sins of others were imputed to him, nor that he suffered as a substitute the punishment that was due to others. I take it that he bore the sufferings which the iniquity of the Jews inflicted upon him; and these sufferings were both mental and corporeal. "He became a man of sorrows, and acquainted with grief." He was baptized into a state of deep sympathy and suffering for a fallen world. I have no doubt that the agony he endured in the garden, was owing to the deep sense he then had of the wickedness of man; for he said, "My soul is exceeding sorrowful, even unto death." These spiritual sufferings appear to have been experienced in some degree by the apostles, when they afterwards became "baptized into Christ," and were "buried with him by baptism into death." Rom. vi. 3, 4. For Paul says to the Colossians, "I now rejoice in my sufferings for you, and fill up that which is behind of the afflictions of Christ in my flesh, for his body's sake, which is the church." Col. i. 24. The true ministers of the gospel must at times be baptized into the states of the people, in order that they may minister to their wants; for the whole church is represented as one body, and "whether one member suffer, all the members suffer with it; or one member be honored, all the members rejoice with it. Now ye are the body of Christ," says the apostle, "and members in particular." 1 Cor. xii. 26. They who are willing thus to suffer and to labor in the cause of truth, offer up to God an acceptable sacrifice, whether it be in living to his glory, or in dying for his cause.

The prophecy of Isaiah (chap. liii.) which has

been quoted, appears to have been understood in a figurative sense by the evangelist Matthew, and he has thrown much light upon the meaning of it. He says, "When the even was come, they brought unto him many that were possessed with devils; and he cast out the spirits with his word; and healed all that were sick: that it might be fulfilled which was spoken by Esaias the prophet, saying, Himself *took our infirmities, and bare our sicknesses.*" Matt. viii. 16, 17.

Now let us inquire how he *took their infirmities, and bare their sicknesses?* Assuredly, not by becoming himself infirm and sick, nor by having his health imputed to them: but he "cast them out by his word," which was the "power of God and the wisdom of God." And in like manner the same Divine word, or power of God, still bears our iniquities; not by imputation, but by healing our spiritual diseases, and casting out every evil spirit from our minds, if we *have faith in him and obey his law.*

With these views, I can readily subscribe to all that is said of Christ in the New Testament; for it appears that not only his spotless life and powerful preaching, but still more the sublime example of his sufferings, were all calculated to operate upon the best feelings of mankind, and to bring them to the knowledge of God.

The doctrine that Jesus Christ suffered as a *substitute* for sinners, and paid the penalty of death that was denounced against Adam for transgression, is equally contrary to reason, and inconsistent with the scriptures. In the first place, it must be borne in mind, that the death which was denounced against Adam for transgression, was not the death of the natural body; or else it would have taken place agreeably to the prediction of the Most High—"In the day thou eatest thereof, thou shalt surely die."

I have shown, in a former conversation, that this death did take place *at the time predicted*, and that it was a death in the soul; for, "to be *carnally minded is death.*" It was a being "dead in trespasses and sins;"—and it is evident that Jesus never did die this death, for he *never sinned.*

That he should suffer an outward death, in order to take away the effects of an inward one, is contrary both to reason and to scripture.*

"Shall I give my first-born for my transgression?—the fruit of my body for the sin of my soul?" Micah vi. 7. Yet the authors of this

* This expression has been misunderstood. The author does not mean to deny that spiritual blessings have flowed to mankind from the obedience and sufferings of Christ, but he denies that Christ *suffered as a substitute* for sinners; or that his righteousness is *imputed* to sinners. "The righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him?" Ezek. xviii. 20.

"He that believeth is born of God, and he that is born of God is justified by Christ alone, without imputation."—G. Fox, *Saul's Errand to Damascus.*

doctrine would take the fruit of Adam's body, (for the Messiah "was made of the seed of David [and consequently of Adam] according to the flesh," Rom. i. 3,) and they would offer it up for the sin of Adam's soul! But let us suppose for a moment, that it was the death of the natural body that was denounced against Adam for transgressions; did Christ's suffering in his stead prevent him from dying? Certainly not: for "all the days that Adam lived were nine hundred and thirty years, and he died." And all his posterity continue to die, notwithstanding *the debt being paid* for us, according to this strange doctrine of man's invention.

James. I think that Jesus Christ is spoken of in the scriptures, as the "one mediator between God and man," and as "the mediator of the new covenant." What are we to understand by these expressions?

Father. This question may be answered in the language of George Fox, who says that "None know Him as a *mediator* and a lawgiver, nor an offering, nor his *blood* that cleanseth them, but as they know him working in them." Vol. 3, p. 119, 120. As God is a spirit, and the soul of man is spiritual, it appears evident that the mediator (or medium of intercourse) between God and man must be spiritual.

The eternal word, or spirit of Christ revealed in the soul, is our advocate and our intercessor. For "the Spirit also helpeth our infirmities: for we know not what we should pray for as we ought, but the spirit itself *maketh intercession* for us, with groanings which cannot be uttered; and he that searcheth the heart knoweth what is the mind of the spirit, because he *maketh intercession* for the saints according to the will of God," Rom. viii. 26, 27. "As the *word* manifested in the flesh, or become man, is the one mediator or restorer of union between God and man; so, to seeing eyes it must be evident, that nothing but this one mediatorial nature of Christ, *essentially brought to life in our souls*, can be our salvation through Christ Jesus. For *that which saved and exalted that humanity in which Christ dwelt, must be the salvation* of every human creature in the world." (See Law's Address to the Clergy, p. 51.) "It is the spirit, the body, the blood of Christ within us, that is our whole peace with God, our whole adoption, our whole redemption, our whole justification, our whole glorification; and this is the one thing said and meant by that new birth of which Christ saith, Except a man be born again from above he cannot enter into the kingdom of God. Now the true ground why all that is said of Christ in such a variety of expressions, hath only one meaning, and pointeth only to one and the same thing, is this; it is because the whole state and nature of fallen man wants only one thing, and that one thing is a real birth of the Divine nature made living again in him as at the first: and

then all is done that can be done, by all the mysteries of the birth and whole process of Christ for our salvation."

"All the law, the prophets, and the gospel are fulfilled, when there is in Christ a new creature, having life in and from him as really as the branch hath its life in and from the vine." (lb. p. 47.)

This union of the soul with God, by obedience to the manifestations of his spirit within us, is the whole sum and substance of the Christian religion. It was this which the blessed Messiah came to preach and exemplify; for the new covenant of which he was the minister, is not like the old law written upon tables of stone, but it is a spiritual law "placed in the mind and written in the heart;" therefore he said when he began to preach, "The spirit of the Lord is upon me, because he hath anointed me to preach the gospel to the poor; he hath sent me to heal the broken hearted, to preach deliverance to the captives, and recovering of sight to the blind, to set at liberty them that are bruised, to preach the acceptable year of the Lord." Luke iv. 18.

How plain and practical was his preaching! "The kingdom of God," said he, "cometh not with observation, for behold it is within you." "Except a man be born again, he cannot see the kingdom of God." The kingdom which he preached is a spiritual kingdom; it is the dominion of God established in the soul, bringing forth "righteousness, peace, and joy in the Holy Spirit." This practical and experimental part of religion is the only one in which the pious and faithful in all ages have agreed;—it is the only part that is essential to salvation; and the best evidence we can give of its possession is, by showing forth the fruits of righteousness in our life and conversation; for the tree will be known by its fruit.

(To be continued.)

Some account of the life and religious experience of RUTH ANNA RUTTER, of Potts-town, Pennsylvania, afterwards RUTH ANNA LINDLEY, wife of JACOB LINDLEY, of Chester county.

(Continued from page 341.)

About the middle of the ensuing winter, believing the time nearly arrived for me to make request to Friends, to be received under their care, I mentioned it, in a solid manner, to my parents, though in great fear, and having mine eyes turned to the Lord, with earnest breathings, that I might be strengthened and assisted in this important step. My mother was much affected, and shed tears; but my father thought it was time enough yet to make such a sacrifice;—that I was young, and had better wait till I was more fixed. I was enabled to tell him, that I was willing to give up the world, and all the en-

joyments of it, for the purchase of a little peace;—that I no longer took delight in those things that had formerly given me much pleasure. He, seeing my mind bent upon it, gave his consent; and the next meeting day my mother went with me to Exeter. After meeting, she called two elderly Friends aside, and told them she felt like Hannah, when she made an offering of her son to the Lord; for she had come to make an offering of me;—also, telling them of my concern. They accordingly took it under care, and, after divers visits from a solid committee of Friends, I was received, in the 5th month, 1787.

I then found, that, far from sitting down at ease, there was a large field of labor opened for me, and, in the prospect thereof my knees were made to tremble. I felt a deep concern to be steady in the attendance of meetings for worship and discipline; and, being distantly situated from them, found considerable difficulty, my father being frequently very averse to my going, particularly when the weather was wet or cold; which proceeded from motives of tenderness, but which, nevertheless, cost me no small degree of exercise; not feeling easy to stay at home, on these accounts, when my health would admit of my going. And as it gave him great uneasiness, and he frequently opposed me, I had often to experience seasons of conflict, sometimes for a week before a meeting for discipline occurred; and my heart was poured forth in prayer to Almighty God, that if it was right, I might have strength to persevere; and that way might be opened for me, though I could see no way. And, for ever blessed be his holy name, he often caused the mountains to skip like rams, and the little hills like lambs, to my humbling admiration. One time, I particularly remember, being appointed to attend the Quarterly Meeting, I asked my father's consent to let me go; he looked sternly at me, and objected. I felt in a great strait, and pleaded much with him. He at last consented, but told me, I need not expect to go again for some months; for he did not approve of women riding about the country in that manner. As I had gained his consent for the present, I was willing to leave my cause to the Lord; in the belief that if he required me to go, he would open the way for me; and after retiring to my chamber, and giving vent to many tears, my faith and confidence were renewed in him who is the everlasting Rock of ages. This was the last time my dear father ever spoke so sharply to me upon such an occasion; for seeing my peace deeply concerned in the strict attendance of meetings, and my endeared mother often pleading with him, he gave up.

May all those who labor under difficulties and discouragements in attending meetings, be encouraged to keep their eyes single unto the Lord, with fervent breathings to him; then, assuredly,

he will open the way for us, even though we may seem to be hedged in on every side.

My exercises and deep baptisms, in the prospect of being called into the work of the ministry, greatly increased: but Oh! my unwillingness to close in therewith was more than words can express. My Divine Master saw meet to cause me to suffer long under a very trying dispensation, which was that of my beloved and tender mother being tried with lingering illness; and there seemed but little prospect of her recovery. The thought of parting with this dear parent, together with the inward exercises of my mind, was almost more than nature could bear. Oh! the nights of anxiety, and days of deep distress, which I passed through, at that time, will never be erased from my remembrance. And in this season of deep affliction, I was made willing to covenant, that if the Lord would spare my mother, I would give up to what he required of me, though it was harder than parting with my natural life. And he graciously condescended to listen to my cry, and restored my endeared parent.

Previous to this, I attended the opening of the Monthly Meeting at Robeson; there were also some friends from the city attended it, and one in particular, in the course of his public testimony, was dipt into sympathy with me in the deep exercise which I was under, together with the prospect of some further trial and sore conflict which I should have to pass through, in order to fit and prepare me for the great and solemn work whereunto my Master was about to call me; which testimony, with the sensations that accompanied my mind, left no more doubt of its being myself that was alluded to, than if my name had been publicly mentioned. This circumstance, together with that of many valuable friends having feelingly sympathized with me, and expressed their prospect respecting me in a more private way, had a tendency to confirm me that the Lord did indeed require an entire surrender on my part, and that I must be willing to become a fool for Chris't sake.

After many probations, secret tears, and prayers to the Almighty Father, for his help and gracious assistance in this awful, solemn work; at a Monthly Meeting held at Exeter, in the 12th month, 1789, and in the twenty-second year of my age, after a season of the most severe conflict I ever before experienced, wherein the day of solemn covenant was brought before the view of my mind, with this secret intelligence, that if I did not give up to what was required of me, my mother should be taken from me,—I ventured upon my feet, and expressed a few words; in which I felt great peace, and believe I had the tender sympathy of most that were present. My esteemed friend John Simpson being there, in the language of encouragement, caused my heart to be truly thankful. He came home

with me; and very feelingly expressed his unity with me; and also a fear lest, through diffidence, I should not sufficiently exert my voice. Which gentle hint was of use afterwards, though at that time, and frequently since, I did not expect ever to be called upon again in the same line; which peradventure may not be unusual to those young in experience. W. S. shortly after went to Philadelphia, and a dear friend, who was nearly interested about me, inquired of him how I was. He mentioned that I had appeared publicly in a few words, which seemed to him like a swelling fully ripe; which when it was opened, became easy. But alas! it was not only to be opened, but probed and fully searched, before the heavenly ointment or balm of Gilead could be availingly applied.

One circumstance I omitted, in the early part of this narrative, which now occurs to my mind. A friend visiting Pottstown meeting, about twelve months after I became plain, and I, being in a very low and discouraged state, went to meeting, greatly desiring he might be made an instrument of comfort to me. He spoke a considerable time, but did not touch upon any thing relative to my condition; and I returned home, under many doubts and fears lest my Heavenly Father had cast me off for ever. My parents were in Philadelphia; and, being alone, I sat down on the sofa, with the Bible in my hand, thinking to gain some instruction and comfort from those sacred truths. I had given up the idea of seeing the Friend, (who was a true father in Israel) or having any opportunity with him, as not being worthy of it; but he, dining, with my uncle's not far distant, was, after dinner walking in the piazza, and looking towards our house, felt a draught in his mind to come over. He knew nothing of the family; but, yielding to impulse, he came; and passing through the outward room, where there was a young woman of the house, without asking any questions, he walked into the parlor, where I was sitting in the situation above described, and without any further salutation than shaking hands, took a seat by me. A considerable time elapsed in deep inward silence, after which he mentioned how unexpectedly he was led to come over, without knowing the cause; but then feeling his mind clothed with sympathy for me, and believing it was for my sake, he imparted much counsel and advice, with a great deal of encouragement to me. Which singular favor did deeply humble my heart, and caused tears of gratitude, contrition, and tenderness to stream from mine eyes.

Having, for my own satisfaction, penned these few hints of my varied conflicts and exercises, and being sensible of the goodness of the Lord to me, his poor unworthy creature,—it is in my heart to say, May it please thee, O most gracious, merciful Father, to bow down thine ear and hear the humble petition of thy handmaid. Oh! be

pleased to lay, with increasing weight, thine Almighty hand upon me. Let it not spare, neither let thine eye pity, until thou hast thoroughly tried me, proved me, and known my works. Be pleased to bring me more immediately under thy refining operation, and enable me to bear with true resignation every turning of thy holy hand; that so I may be purged and purified, fitted and qualified, rightly to engage in the awful and solemn work whereunto thou hast called me. Or if, most gracious Lord, thou art pleased to cut short thy work, Oh! let it be in righteousness; and grant me admittance into thy ever blessed kingdom of light, life, and peace; there to join in the holy anthems of glory, glory, hallelujahs, and praise, to the Lord God and the Lamb; who art worthy for ever, saith my soul. Amen and amen.

RUTH ANNA RUTTER.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 342.)

The following letter, written to one of the friends of her youth, who had not seen her for some time, will give an account of the change which had taken place in her views and feelings:—

NEW BEDFORD, 11 mo. 7th 1844.

Thy question rings in my ears with a half-painful sound, 'What has changed you so?' The change has been so gradual, that I am not aware, until I meet those who have not seen me for years, that it is so great, but then I almost invariably hear some remark of the kind.

Well, dear, time and care have no little effect; although it may be a slow wearing, it is a sure one; and though an enthusiastic, ardent, restless temperament, may be difficult of subjection, it is one which shows the process better. When thou knew me I felt more keenly, but was less happy than now—now that joy has not so much power to elate, or sorrow to depress me—now that my aspirations are very nearly quenched, and my mind 'subdued to what it works in.' It is a less interesting condition, but it is one much more comfortable. I smile with a little sadness when I hear myself spoken of as so calm; for, after all, if we are in any degree purified, it is 'so as by fire.' I consider myself, however, as having great reason to be thankful that circumstances have been such as to compel me to this course; that cares, anxieties, sorrows which I could not elude, have continually checked me, and forced me to form a more sober estimate of life.

Now I only wish to form a habit of seeking for pleasure in duty alone, resolutely rejecting any enjoyment which conflicts with it in the slightest degree. I have such an abiding sense of the transitory nature of both earthly joys and sorrows, that I feel it to be wrong to be much moved

by them. Why trouble ourselves about the inconveniences of our journey, or be excited by a pleasant occurrence that is soon passed by?

Does thou remember the Eastern fable, that Solomon, on being asked by a prince to give him a maxim which should prevent him from being elated by prosperity, or depressed by adversity, gave him, 'This also passeth away.' Something of this feeling is continually in my mind.

But I do not mean to speak as if I even wished to attain to a mere philosophical calmness. If in any degree the restless, irritable, ambitious feelings of my early youth are quieted, if I am enabled to be more useful, and to find pleasure in that, rather than in the gratification of my own tastes (and I long that this may be more and more the case), it is, thou wilt know and feel, only owing to that grace which is mercifully extended to us, poor, miserable, blind and naked as we are, to which nothing is impossible, or there would be no hope of our ever becoming meet for the kingdom of heaven.

Our Father mercifully stains the beauty of this world in our view, dims all our pleasant pictures, shows us the vanity of our desires, lets us feel the deep disappointment of having our wishes refused, or one deeper still in having them granted, that we may long for 'the quiet habitation' which He provides, and learn to be thankful beyond measure for the 'still waters' which we once despised.

The way is long and sometimes dreary, but we are journeying to a better habitation, that is an heavenly. Is not this enough? Let us encourage one another to press forward to receive suffering as well as enjoyment thankfully, and let patience have its perfect work.

To an intimate friend—

NEW BEDFORD, 11 mo. 14th, 1844.

I have been passing my time very pleasantly in Philadelphia, but rather too much in the bustle after all, and I now long to get quietly settled down to home duties, feeling that such a constant round of enjoyment is not the most favorable, even to happiness; but it has been very pleasant. People are so much more kind to me than I deserve, or can possibly understand why, that it must and does give me great satisfaction. I have been away from home five or six weeks, and visited New York, Baltimore, Washington and Philadelphia; and if I can only go back, and feel that I have not done any one any harm, it will be a great favor,—if I can only hope that I have not been led so far out of the way as to prove an occasion for stumbling in any. We cannot avoid influencing others, and being influenced by them, and it is a fearful thought that a brother's blood may one day cry against us. Oh, my dear, I do at times feel that it is such a serious thing to live, that I am almost overwhelmed with the many considerations it involves. And while we feel our weakness, we are not always willing to go to

the right Source for strength; shrink from the patient waiting, the quiet endurance of shame and suffering necessary for our purification. I am grieved to the heart at my own ingratitude and wilfulness. But still our Father cares for His rebellious children, and embitters their cup of enjoyment, refuses them the blessings they most earnestly desire, till in the day of His power they are made willing to submit. Indeed, we have cause to bless Him 'most for the severe.'

We have all felt much sympathy with you in the recent affliction you have experienced. We were well qualified to sympathize in such a sorrow. But there is such abundant consolation withal, that our natural grief is silenced when we think that our beloved ones are taken away from so much evil. Sorrows wear upon our hearts, and storms of temptation assail, till in bitterness of spirit we may say, 'Mine eye shall no more see good;' but they are at rest—they dwell forever by the still waters, and lie down in the quiet habitation. We will praise Him for this, and may we be enabled to live so that when He is pleased to summon us also from a world whose beauty He hath dimmed, we too may die the death of the righteous, and be admitted to a place, though it be the lowest, in the mansions prepared for them.

To the same friend on the death of her father:—

NEW BEDFORD, 3 mo. 4th 1845.

I have often thought of thee during the last few weeks with the tenderest sympathy and affection, and have frequently attempted to express it; but what could I say? No human consolation can avail at such a time, and I feared, unbidden, to touch so deep and so recent a wound, least I might only add to thy suffering. Yet I trust thou hast not lacked consolation, but that thy heavenly Father has been to thee as He hath promised, strength in weakness, and a present help in the needful time; that the arm of Divine Love hath been around thee and beneath thee, preventing thee from sinking in the waves of affliction. We have all cause to mourn the loss which we have sustained, and, above every selfish consideration, we mourn that the Church, now in her need, should have lost one of her most valiant soldiers; but it is the Lord—let Him do what seemeth to Him meet. Oh, my dear friend, what a blessedness it would be to know our own wills wholly swallowed up in the Divine will, so that we might be careful for nothing in any way. Sometimes the heavy chastenings appear to accomplish this in some measure, and it is not often the mission on which they are sent?"

(To be continued.)

It is not easy to straighten in the oak the crook that grew in the sapling.

For Friends' Intelligencer.

INDIVIDUAL FAITHFULNESS.

Our circumstances, temperaments, and experiences are so various, we can scarcely be expected to see eye to eye on all points; yet, if we keep our hearts with all diligence, and are concerned to abide in that charity which "hoped all things" and "rejoiceth in the truth," we shall be enabled to do those things that are required of us individually, and to leave our brother to follow the Divine impression upon his own mind.

When we view the condition of Christendom, we must be convinced that it is not a time to waste our strength in controversy. Let us leave the little unimportant differences that have a tendency to "divide in Jacob and scatter in Israel," and rally to the fundamental principle of our profession. Though the times and the circumstances are very different now, from what they were in the rise of our Society, yet, the necessity was never more imperative to have oil in our vessels than our light may shine, than at the present day.

The problem of our peculiar faith must be worked out by a godly and consistent life. We must not rest satisfied with professing a belief in a Saviour in the heart, but we must live out his holy revelations in our daily practice, and thus demonstrate before the world that we are not following cunningly devised fables.

If our testimony to the universality and sufficiency of divine light was too great an innovation upon priestcraft to be generally received in the time of George Fox, I would ask what advance have the clergy made in the acknowledgement of this all-important principle during the past two hundred years? How many among them now will admit, "Christ has come to teach his people himself?" On the contrary, are they not making increasing efforts to strengthen their power by associations in every publication of which sectarian principles are engrafted, and by ecclesiastical compacts which proscribe all sects not deemed by them evangelical? Are not war, slavery and the death penalty, although anti-christian, still preached to hundreds and thousands under the sanction of canonical authority? While these things are so, how can we feel exonerated from using our influence to unbind the heavy burdens that tend to keep the people in darkness?

When Jesus sent forth his disciples, the command was not to build fine churches, nor to establish Pharisaical Associations, but to "heal the sick, cleanse the lepers, raise the dead, cast out devils: freely ye have received, freely give."

I sympathize with every right effort for moral and religious improvement—it is greatly needed—but it is not by the observance of holy days and fast days, nor by the sadness of the counte-

nance, that the heart is made better, but by entering into our closet, and when we have shut the door upon worldly influences, praying to our Father which is in secret, so to enlighten our spiritual vision that we can walk worthy of the high vocation whereunto we are called. While we "forsake not the assembling of ourselves together" for social worship, we must remember with Fenelon that "the best of all prayers is to act with a pure intention, and with a continued reference to the will of God."

A recent writer from a neighboring watering place remarks, "they are all distinguished by a general and beautiful *insouciance* while they are here. At 9 o'clock there is a Union Prayer Meeting, at 11 they bathe, dine at 1. After dinner, a nap, a drive, reading, conversation and amusements. After tea, some dance, some play, some visit their friends in the different hotels, and so with prayer and praise the day draws to a close, its eyelids are shut upon us, and our God enfolds us in the wings of his mighty protection, and so he giveth his beloved sleep."

After enumerating the various amusements in which they indulge, not excepting billiards, he continues, "It is one of the signs of the times, that while there is greater levity among our people so there is more religion. Wesee this in the number of the houses that have opened their parlors for morning worship; in the throngs that attend the daily prayer meetings; in the great numbers that attend church here, and keep Holy Day."

Now, the apostle tells us, "Religion is *godliness*, or *real piety in practice*, consisting in the performance of all known duties to God and to our fellow men, in obedience to divine command and from love to God and his law," and that "pure religion and undefiled before God and the Father is this, to visit the widow and the fatherless in their affliction, and to keep himself unspotted from the world."

A religion that is assumed at stated times and seasons is not one calculated to overcome our selfish feelings and render us fit temples for the living God. We must continually watch lest we enter into temptation, and pray to live hourly under a proper sense of our accountability to the Father of all our sure mercies. We are at all times in his presence and at all times responsible for our thoughts and actions, and if we are duly impressed with this great truth, we will be less disposed to make a high profession of religion, than to humble our hearts under a just sense of our unworthiness.

Believing the principles we profess are those inculcated by our Divine Master, may we not humbly rejoice when others are brought under their influence? Let us then have more faith in them, and not suffer them to lie dormant for want of great occasions for their exercise. The principles of Friends are the only principles that can stand the test of Scripture, and I would that

each member may be so thoroughly impressed with their efficiency, and so individually faithful to every requirement, that ability may be afforded to the body to manifest them consistently before the world. H.

Philadelphia, 8th mo. 10, 1859.

THE CITY AND THE SUMMER VACATION.

WHERE SHALL WE GO?

The city and the summer do not go well together, especially when the city is very compact and crowded with inhabitants. Our friends who live in the country have doubtless their own special perplexities, and are tempted from time to time to take the cars, once for all, and come into the immediate vicinity of shops, lecture-halls, and—markets,—for, though everything grows in the country, very little is to be bought in the country, and you must seek in the city the fruit and vegetables that were raised by your next door neighbor. But one perplexity the villager has not. He is spared the perpetually recurring question, What shall we do with ourselves, what shall we do with our children, during these summer months,—at least during the long school vacation? It is surprising how many questions are opened by one question. This singular inquiry, Where shall the family go? connects itself with the great matters of physical education, of instruction in *things* as compared with lessons about *words*, with the relation of manual to mental labor during the time of youth, with the disabilities and peculiar temptations of the children of the poorer classes in our cities, and with—we know not how many other matters.

In these few sentences we have of course no intention of discussing so many topics. We have mainly in view but a single point. We have one answer to propose to the question, Where shall we go?—an answer which, although it is partial and will not suit every case, will suit very many cases. *Go where the children will learn something and have a good time*, where they may supply some of the deficiencies of their school training, and lay in a large stock of health against the long winter confinement. Parents often object to the long vacations, which a regard for the health of the teachers at least seems to demand, and if these vacations must be passed in the city, their utility for the children is certainly very questionable; but whenever the change can be made, even though at considerable inconvenience to the parents, the boys and girls should be carried beyond the rows of brick and granite walls to the sweet fields and shaded hill-sides. It is sad indeed to see a child, in midsummer, sitting upon a hot doorstep, in a street which is all ablaze with the sunlight, too much debilitated even to make a noise,—and when children are reduced to that, we may be sure that they are pretty weak; and if they must

stay in the city, they are quite as well off in our school-houses, many of which are well situated, and divided into spacious and airy rooms. But whenever they can go into the country, the problem is delightfully solved; for some weeks at least of every year ought to be passed by our children on the sod, were it only to secure anything like completeness in their training.

And, as we say, the first point to be settled is, What will be good for the children?
